All proposals were reviewed for technical content by a team of Department of Transportation engineers who ranked them in order of technical merit. The rankings were presented to a special subcommittee of the Permanent Advisory Committee. This subcommittee, consisting of representatives of the construction and forest products industries, concurred with the rankings and subsequently recommended to the full Committee that the top ranked proposal for each project be accepted. At its October 30, 1986 meeting, the Permanent Advisory Committee requested by resolution that the Commissioner of Transportation designate the top-ranked agencies as the research contractors. Commissioner Franklin E. White made these designations on December 24, 1986.

The studies proposed and contractors chosen were:

Project Number TWC-1, Economic and Safety Consequences of Increased Truck Weights, Cornell University, School of Civil and Environmental Engineering, Ithaca, NY.

Project Number TWC-2, Effect of Truck Weights on the Deterioration, Operations, and Design of Bridges and Pavements, Byrd, Tallamy, MacDonald and Lewis, Falls Church, Virginia.

A summary of the objective, scope, methodology and findings of each of these studies follows.

B. Economic and Safety Issues

The objective of research project TWC-1 was to provide a comprehensive review of the state of the art knowledge on the economics and safety aspects of the permit legislation. To accomplish this objective, the contractors were directed to review domestic and foreign practice and research findings, to quantify the impacts of the permit law on the trucking and construction industry, and to quantify the effect of heavier vehicles on public safety, property damage, injury, and highway deaths. Significant findings are summarized below.

Existing Information

A survey of other state transportation agencies revealed that although very little information on the safety and economic consequences is available, the need for this information in considering truck weight legislation is strongly recognized. Review of domestic and foreign practice and research findings provided an up-to-date bibliography of significant documents. Available literature relating vehicle weight to economic costs and benefits, however, is sparse.

The existing general information on truck safety is substantial, both from U.S. and foreign sources, although specific data on the relationship between truck weight and accident exposure is unavailable. Although there is a public perception that truck weight and speed threaten safety, it is generally accepted that trucks should continue to travel at the same speeds as other vehicles. Australian authorities identify route selection criteria, mechanical requirements, operational conditions and administrative requirements as necessary components in a program to assure truck safety.

Weight-Permit Vehicle Usage

A carefully planned and executed survey was used to develop estimates of weight-permit usage with respect to equipment type, loads hauled, miles travelled, travel speeds, origin and destination patterns, and the nature of the operators. The survey was based on a random sample of the 11,706 permitted vehicles, with the survey being stratified by county where registered, the length and severity of the counties' freezing season (for pavement and bridge analysis) and the number of permitted vehicles registered by a single operator. The number of trucks surveyed was 800, with responses received

from 302. Comparison of these responses with distributions of vehicle make and age, and freeze zone from the total sample, demonstrated that the results are representative of the full population.

The survey indicated that 88 percent of the respondents still operate their vehicles as permit trucks and 61 percent were used on the survey days. Three axle trucks and rigid body trucks predominate, representing 52 percent and 66 percent of the responses providing this information, respectively. Trucks with more than five axles were rare. With respect to body type, dump trucks (50 percent) and concrete mixers (18 percent) represent 68 percent of the responses. The construction and sanitary services businesses accounted for 58 percent of users reporting. The majority of permit trucks have tare weights less than 40,000 pound.

The results of the survey are somewhat compromised because they represent permit usage only during a one week period in August, 1987. This limitation is a consequence of the abbreviated time frame for these studies and the resulting inability to repeat the survey during different seasons. Seasonal variations in permit use can be expected, the most obvious change being a decrease in construction and an increase in fuel oil hauling during the winter months. Approximate seasonal adjustments were made to the results for construction and agriculture to compensate for the lack of quantitative data.

Primary Benefit Analysis

The benefits of the permit system were evaluated by comparing the cost of trips made under the permit program to the cost that would have been incurred if the same volume of goods were delivered within the current federally specified weight limits. Thus, the delivered goods were reallocated to more trucks with lighter loads. The analysis was performed separately for each of the seven industry types identified in the survey. The three major cost components included were the standing cost for the truck for the day, labor cost for the driver and operating costs incurred during the trip.

Results of the benefit analysis indicate that the annual operating costs of permitted trucks are reduced by nearly $690 million from what they would be if forced to operate under the current federal limits. The error in this estimate is believed to be less than 10 percent based on a statistical analysis of the survey data. The construction industry is most benefited by the permit program, with savings of over $400 million. Additional data analysis showed that four axle trucks are most benefited, presumably as a consequence of the favorable treatment of tridem axle arrangements.

Secondary Economic Benefits

The primary benefits analysis just described implicitly assumes that the volume of delivered goods remain constant. The benefits enumerated accrue solely to the affected industries and cannot be claimed to be statewide benefits without further analyses. For example, the movement of a constant volume of goods with fewer trucks means fewer drivers with a resulting loss of wages to those displaced. On the other hand, decreasing delivery costs implies decreasing prices which may result in a stimulus to the economy. The purpose of the secondary benefit analysis is to quantify these effects and determine the net effect on the State's economy resulting from the permit legislation.

In addition to the analytical complexities involved in determining secondary impacts, the economic data requirements are formidable and not fully satisfied by existing sources. Despite these difficulties, the secondary benefit analysis was completed successfully and showed that the weight permit program will result in a net increase in output of $4 million and a $1 million increase in earnings in New York State annually. Employment is also predicted to experience a modest increase of 49 jobs.

These secondary benefits are in addition to the substantial $690 million reduction in direct costs expected to be experienced by consumers of New York State's products.

The reliability of these estimates of secondary benefits is compromised by evidence of high sensitivity to changes in the input to the analyses. In addition, because bridge and pavement costs have not been subjected to this type of analysis, only direct benefits should be included in a numerical benefit-cost analysis of the permit program.

Safety Consequences

As stated previously, there is no information on the accident involvement and safety risks of the weight permit trucks in particular, or heavy trucks in general. Accident data involving trucks in New York was obtained, but the necessary cross-tabulation required to determine exposure levels and to stratify the accidents by vehicle weight was not obtainable in the time frame of this study. Consequently, conclusions drawn are based on data for the total truck population, with the further limitation that the validity of the data gathering and statistical procedures producing this information could not be independently confirmed by the research team. Despite these limitations, the research team believes that meaningful conclusions have been made about the safety consequences of the permit program.

The major finding is that greater accident severity and involvement for heavy trucks (gross vehicle weight greater than 26,000 lbs.) cannot be conclusively attributed to vehicle weight. The consequences of mass differences in truck/car accidents change insignificantly beyond ratios of 5:1 or 6:1. These mass differences are well below the range associated with the weight permit fleet. It was also found that rigid trucks, the most common in the weight-permit fleet, have the lowest accident rate of all vehicles. The overall conclusion is that the reduction in miles driven by the truck fleet affected by the permit system has resulted in a decrease in fatalities, injuries, and property damage.

Recommendations

The consultant made several recommendations relating to data requirements and analysis tasks that should be implemented to improve the reliability of their assessment of the economic and safety consequences of the weight-permit system. These include:

- Repeat the weight-permit usage survey across all seasons,
- Augment the permit application file to provide data on the composition of the permit fleet,
- Encourage the development of detailed economic data for the State for use in secondary economic impact studies, and
- Encourage improvements in truck accident investigation and reporting.

C. Impacts on Bridges and Pavements

The objective of research project TWC-2 was to provide a comprehensive review of the state of the art knowledge on the effect of increased truck weights on the deterioration, operation, and design of highway bridges and pavements. To accomplish this objective the contractors were directed to review domestic and foreign practice and research findings, to estimate pavement deterioration rates due to heavy trucks, to predict the consequences to highway bridges of increases in truck weights and frequencies, and to estimate the cost of increasing the load capacity of the State's bridges and highways. Significant findings are summarized below.

Existing Information

There has been extensive research into the effects of increased truck weights on roads and bridges. This research supports the conclusion that heavier vehicles can cause greater pavement damage but that it is difficult to determine the damage caused by a particular class of vehicles. The difficulty in measuring traffic and loadings is cited as a

major difficulty in estimating damage and costs. It has also been found that the effects on bridges is influenced by the structure type.

With respect to administration, it has been found that detection of overweight vehicles and enforcement increase the effectiveness of weight laws. Fee structures, including penalties, play an important role because there are economic incentives for operators to use overweight trucks. Seasonal permits are used in some states to reduce pavement damage.

Conditions in New York

The evaluation of the effect of the weight permit system requires knowledge of the frequency and magnitude of truck traffic. This information was obtained through examination of truck weight histograms obtained in weigh in motion (WIM) studies performed by the Department of Transportation, the results of the usage survey performed under project TWC-1, and census data on truck registrations. The histograms were modified by redistributing the excess weight carried by the permit trucks to a greater number of trucks carrying the same total load at the non-permit weight limits.

The modified histograms show that a significant proportion of trucks operating in the State exceed federal limits, but do not have annual divisible load weight permits. It is not possible to identify the proportion of these overweight trucks operating under trip permits or the non-divisible load provisions of the Vehicle and Traffic laws. These heavy trucks, whether legal or illegal, tend to mask the effect of the annual weight permit program.

Effect of Permit Loads on Pavements

Existing research has established a relationship between pavement damage and 'equivalent single axle loads' or ESALs. ESALs represent the number of 18-kip axle loads which would produce the same pavement damage as the actual traffic stream. The ESALs for existing traffic were determined from the WIM data for each permit truck type. ESALs for permit trucks were then removed from the existing traffic and redistributed to a greater number of non-permit trucks. These calculations were performed for all truck types and the data were sorted by functional class highway grouping. Because of the relatively large numbers of overweight trucks and the small proportion of these that have annual permits, the change in pavement damage resulting from the weight-permit program is small.

The operation of annual permit vehicles on principal arterials results in a 2.2 percent decrease in truck traffic and a 3.0 percent increase in pavement damage, the largest increase found for any functional class grouping of highways. This magnitude of change is considered below the accuracy of

pavement design methods and presents a change in asphalt thickness of approximately 0.1 inch. In practice this change would be ignored, but for the purposes of this study was converted to an estimated annual cost of $500,000.

Effects on Bridges

The most serious impact of the weight permit program on highway bridges is metal fatigue, a property of steel causing it to fail under repeated applications of load. While fatigue can damage any steel structure it is of particular concern to small and moderate span bridges that include details that are fatigue prone. One specific type of structure that is fatigue prone to the point where its fatigue life can be reduced well below its normal 50 to 75 year design life on highly traveled highways is the simple span, rolled beam bridge with partial-length cover plates. These bridges represent 19 percent of the bridges on the state system and were used as the indicator structure for this study.

The gross vehicle weight, as opposed to the individual axle weights, is critical for bridges. Accordingly, the distributions of gross weights obtained from the WIM data were analyzed to determine the fatigue damage produced by existing traffic. These distributions were then modified by redistributing the permit trucks. The difference in the fatigue damage associated with the actual and modified distributions represents the effect of the permit system. This difference was found to be small. Additional costs resulting from this difference were attributed to the increased frequency and sophistication of inspection required, and the anticipated need for repair of fatigue damage. This annual cost was estimated to $23,000.

Although the annual cost of fatigue damage attributable to the annual permit program is low, it is incorrect to conclude that heavy loads have a minimal effect on the State's bridges. The weight-permit fleet represents only a small proportion of truck traffic stream that can be shown to be large both in terms of effective weight and volume. The potential exists for rapid fatigue damage to the State's bridges.

The replacement cost of all restricted bridges was also calculated. There are currently 797 restricted bridges on the State system with span lengths ranging from 20 to 379 feet. Replacing these bridges with structures meeting State standards for load capacity and width was estimated to cost $546 million. This amount is based on an average construction cost of $60 per square foot. The annualized cost of these replacements assuming construction over a 10 year period and a 50-year life is $18.6 million.

Recommendations

The consultant's recommendations relate to evaluating and mitigating the effects of fatigue on New York bridges. These are:

- Data on truck weights using WIM equipment should be collected in downstate counties,
- A regular and comprehensive fatigue inspection program should be implemented as an extension of the efficient existing bridge inspection program,
- The benefits of increased effort in the weight enforcement program should be examined.

D. Summary and Conclusions

The research performed has provided information on the costs and benefits of the weight-permit program based on the actual usage of the permit trucks. The benefits of the program have been shown to be largely savings in direct operating costs amounting to $690 million. The construction industry is the prime beneficiary of these savings. An analysis of secondary benefits to the New York economy was hampered by the deficiencies in data on the State's economy. These benefits were, however, estimated to be positive.

Costs to the State resulting from the permit system were estimated to be small. It should be noted that this conclusion deals only with the Overweight Divisible Load Permit program and not with the high volume of other permit or illegal trucks exceeding the federal weight limits. The estimated annualized cost of pavement and bridge repairs related to the program together with the cost of a bridge replacement program for weight restricted bridges is $19.1 million. No evidence could be found to suggest that the safety of the traveling public is compromised by permit trucks.

The methodologies used by the research contractors to evaluate the magnitude of the payloads carried by the permit trucks in excess of the federal limits differed. These differences resulted from a difference in the data needs of the contractors in their analysis of effects which were not possible to resolve in the rigid time schedule of these projects. Logistical and professional considerations compounded the difficulty of achieving full coordination between contractors. The consequences of these differences on the conclusions of the Permanent Advisory Committee for Truck weights is believed to be small because of the relatively

large benefits and low costs estimated to result from the permit program. It should be clear, however, that a rigorous evaluation of the general question of the effect of changes in truck weight limits should only be performed with a strict consistency of methodologies for both cost and benefit analyses.

V. PERMITS AND ENFORCEMENT

A. Overweight-Divisible-Load Permit Program

To determine the scope of the administrative process necessary to implement the permit program, motor vehicle registration data was used to identify the potential population for overweight-divisible-load permits. The projected workload volume dictated computerization as the most reasonable method of processing the permits.

A computer program was developed, and equipment was purchased and ready for operation within three months of the time the decision was made to computerize. The volume of permit requests was overwhelming during the first few months of eligibility and a considerable backlog resulted. To cope with the backlog several steps were taken, including adjustments to the computer program, realignments of staff for improved efficiency, and extensive use of overtime.

In addition to the heavy volume of requests, the program was further impacted by the introduction of refinements identified by the Truck Weight Committee and recognized as being reasonable and desirable. As these various elements surfaced, it became increasingly evident that the initial computer program was not adequate. The Department of Transportation Computer Services Bureau was requested to conduct a thorough study of this permit activity and design a computer system more suited to the needs of this program. The initial study results confirm the need for the development of a new system. According to the latest projection, it is anticipated that the new system will be in place by mid-1988.

From January 1, 1986 through October 31, 1987, 60,907 permits have been issued and $11,327,814 in fees have been collected.

Insurance coverage, required under the divisible load permit system, presented a serious problem. Many small companies and individual truck owners experienced extreme difficulty in obtaining the required protective liability insurance coverage. The Department of Transportation worked with the Insurance Department to develop an alternative option through use of basic motor vehicle liability insurance, with a specific endorsement to include the required protection that would parallel coverage provided through the protective liability policies.

B. Weight Enforcement Assistance Program (WEAP)

The Weight Enforcement Assistance Program evolved from the enactment of Chapter 549 of the Laws of 1985. This law made funds available to counties and other municipalities (which has its own independent program), other than the City of New York, for the purpose of strengthening local weight

enforcement programs. The intent was to reduce the number of vehicles traveling the State's highways that exceed the weight limits prescribed by law. This was to be accomplished by substantially increasing the number of trucks weighted, thus increasing the likelihood that overweight vehicles would be apprehended.

For the 1986-87 Fiscal Year, the Legislature appropriated $1.5 million to this program. The Department of Transportation in turn allocated the funds to 57 counties based on a funding formula that included each county's number of registered commercial vehicles over 10,000 pounds, total number of highway miles, and 1980 population.

During the program's first year (FY 86-87), there were eleven (11) counties with thirteen (13) local police agencies participating in the program. Funds awarded to the participants amounted to $1,038,886.

As with any new program, the enforcement efforts were delayed due to start up operations and time required for the purchase of truck weighing equipment. Significant expansion of the weight enforcement program will be realized the second program year (FY 87-88) with twenty-two (22) counties desiring to participate. The grant period began December 1, 1987, and will end November 30, 1988. Funds allocated for the second year amount to $911,000.

Funding allocations for each county and funding allocation formulas can be found in the Appendix.

38-258 O—91——61

VI. CONCLUSIONS AND RECOMMENDATIONS

The Permanent Advisory Committee on Truck Weights has expressed its sentiment that it has satisfactorily addressed the legislative purpose and requirements of Chapters 549 and 929 of the Laws of 1985. The forum provided through this Committee was very useful in providing recommendations to increase the efficiency of the permit program and to share the respective views of all parties concerned with maintaining a healthy and safe trucking industry in New York State.

The Committee offers the following conclusions and recommendations for the consideration of the Governor and the Legislature.

A. Summary of Conclusions

The extent of the research which was undertaken to investigate the economic, operational and safety impacts of the overweight divisible load permit provisions and the effects of truck weight on pavement and bridges was limited by fiscal, time and data availability constraints. However, it is the Committee's consensus that the following conclusions can be made:

1. There are significant net positive benefits to the State's economy associated with the Overweight Divisible Load Permit Program.

2. There is no conclusive data available which can be used to determine the safety impacts of the Overweight Divisible Load Permit Program in New York State. However, the Permit Program does reduce truck accident exposure due to the reduced number of truck miles which must be travelled. Research which was carried out at the National level has shown that there is no indication that marginal increases in truck weight result in an increase in accident rates or accident severity.

3. The annual cost of bridge fatigue and pavement damage which is attributable to vehicles which operate pursuant to an Overweight Divisible Load Permit is small due to the small proportion of the overall vehicle population that these vehicles represent. However, it would be incorrect to conclude that heavy loads have a minimal effect on the State's highway pavement and bridges. The potential exists for accelerated fatigue damage to the State's highway pavement and bridges due to heavy loads.

B. Committee Recommendations

The Committee submits the following recommendations for consideration:

1. The Overweight Divisible Load Permit Program provisions which are outlined in Section 385, subdivision 15, paragraph (f) of the Vehicle and Traffic Law, should remain unchanged at this time. The Committee will continue to monitor the Program and consider recommendations for future changes.

2. The Department of Transportation should implement a regular and comprehensive fatigue inspection program as an extension of its existing bridge inspection program.

3. Truck safety conditions should be added as required conditions for the issuance of divisible load overweight permits as follows:

    a. Braking;
    b. Mechanical inspection;
    c. Front and rear under-run;
    d. Coupling strength.

4. The Department of Transportation, in cooperation with other appropriate State agencies, should address concerns regarding increased truck weight and size as part of a comprehensive truck safety platform which would include improved equipment, weight and other safety enforcement initiatives. In addition, the State Police Weight Enforcement Program should be strengthened to insure compliance with weight limits allowed under the permit system, bridge related weight violations and other associated commercial vehicle statutes.

5. The Departments of Transportation and Motor Vehicles and the Division of State Police should undertake a cooperative effort to improve the quantity and the quality of truck accident data to improve the reliability of future truck safety analyses. In addition, the Department of Transportation should implement a mechanism to improve the quantity and quality of data related to Overweight Divisible Load Permit usage and expand Weigh-in-Motion data collection efforts to Downstate counties.

DTIA vs. FBF
U.S. Public Works and Transportation
Subcommitte on Surface Transportation April 24, 1990

The Dump Transport Industries Association (DTIA) is a non-profit organization based in Youngstown, Ohio, and representing the interests of those involved in the dump truck industry throughout the Nation. We primarily aim towards serving the interests of those companies that operate fleets of trucks using end-dump semi-trailers in interstate commerce. Our membership includes fleets, manufacturers, and suppliers to the dump truck industry from more than a dozen states.

DTIA was formally organized in 1980 as the answer to the growing dissatisfaction within the dump industry over the lack of representation of the industry's unique problems. DTIA is very active in promoting fair size and weight standards, safe and responsible operations of dump equipment and accurate and equitable enforcement at both the Federal and state levels. In addition to achieving respect in the legislative and enforcement areas, DTIA has also been the strategic influence in promoting dumps and their unique versatility for such major projects as the Tennessee-Tombigbee waterway system.

BACKGROUND

Please be advised that our segment of the motor carrier industry, specifically the end-dump semi-trailer user, has many serious problems with the existing Federal Bridge Formula (FBF). The effects of length for weight have been ignored for our industry. It is a very large and controversial issue for the end-dump semi-trailer user.

At the time that the FBF was made a required national law, it was generally believed that this legislation was passed in an attempt to restore to the industry the productivity lost due to the imposition of the 55 mph speed limit in December of 1973. This intent may have been there, but for our industry there was no restoration of productivity; it was destroyed as <u>we were forced to purchase new, more expensive, larger and heavier trucks to carry the same GVW under the FBF and usually less payload</u>. See the attached page (Exhibit A) for a visual sense of the vehicle change required to attempt to maintain payload weight.

End-dump semi-trailers and short contruction vehicles that have to operate on the Interstate System are among the ones who are suffering the most as the result of the emphasis on weight enforcement related to the distance between axle groups. Payloads have been severely reduced, and all we get to share in is the increase in taxes! To add insult to injury, dump trucks, because of their heavier than normal tare weight, actually get to spread the taxes over less payload which raises the cost even more. Dump trucks pay a disproportionate part of the increased taxes for which they received no benefit in the first place.

Safety and equity are destroyed for the end-dump as long as increased weight is related to increased length. An end dump, due to its need to be raised into the air to unload, must be as short as possible, for safety's sake, since the longer it is the higher it goes into the air while unloading. The higher into the air it goes, the more likely it is to fall over, whether due to imperfect loading, imperfect unloading conditions or wind.

The current FBF further requires the front loading of the dump body so as to be able to transfer weight forward to the steering axle to meet the 12,000 pound steering axle weight needed to achieve 80,000 pounds GVW, unless you are willing to accept the risks of a much longer trailer that violates safety considerations. See the attached page of diagrams that show some of the current options available to us, none of which are satisfactory (Exhibit B):

Figure 1 shows a standard five axle combination with a frame type end-dump semi-trailer. It is generally too heavy, too long and too unstable since it needs to be front loaded to achieve a 12,000 pound steering axle for an 80,000 pound GVW and towers nearly forty (40) feet into the air while unloading.

Figure 2 shows a standard five axle combination with a frameless end-dump semi-trailer. It is generally lighter and a little more stable since the "scissoring" action and lower hinge point keeps the unloading height lower, and the "A Frame" support attached near the midway point provides some added stability. It is still too long and unstable due to the front loading requirement. There are also those that question its durability.

Figure 3 shows a new popular idea, the "Six Axle Concept" that this Association strongly supports for its many benefits, some of which include: a shorter body for less unloading height and more stability; a three axle trailer group that permits the shorter body, reduces axle loadings, and provides a more stable base for dumping support as well as better tracking and braking. However, the current FBF still requires that this vehicle be front loaded to achieve the 12,000 pound steering axle. We believe such a superior vehicle should be given exceptional consideration at least equal to the thirty-six (36) foot "tandem - tandem" exception provided in the current FBF, and have introduced legislation accordingly.

Figure 4 shows the truck and trailer combination popular in the West. Although it will comply with the FBF quite nicely, it is not the standard vehicle in the eastern part of the Nation and represents many major problems, some of which include: a major economic loss to convert to such vehicles, less flexibility since the truck cargo body cannot be detached and interchanged, less efficiency since two cargo bodies must be loaded and unloaded each time, more maintenance expense since there are more moving parts

to wear in the body transfer mechanism and two covers that would need to be maintained, and more risk involved for personnel in covering and uncovering two cargo bodies as well as transferring the transfer box.

Operations in the eastern part of the country also are severely restricted due to the fact that many of the facilities that the dump industry serves are much older and designed around much smaller equipment. The very large vehicles demanded by the FBF have a very difficult time negotiating in and around these facilities. In fact, some sites require inside unloading, with the obvious troubles that result from a trailer designed to be raised many more feet into the air to unload than what the building's interior design will allow.

The dump truck transportation segment of the motor carrier industry is generally recognized to be about five percent (5%) of the truck population. Yet, because of the nature of most dump truck work this small number of vehicles can have a significantly greater impact. Dump trucks usually make numerous trips per day within a smaller geographic area, compared to other trucks just passing through. To not allow this segment of the trucking industry to realize its maximum productivity exposes many more vehicles than necessary to the hazards of highway travel and increases any detrimental environmental impacts that trucks may contribute to. It also greatly increases the costs of those industries dump trucks serve. Dump truck transportation costs are a significant part of highway, bridge and general building costs.

PROPOSED SOLUTIONS

DTIA believes that the Nation needs a method of measuring and enforcing truck sizes and weights that takes into consideration the present and future, not so much the past, and overall highway safety as it relates to total vehicles of various sizes on the road. The current highway and bridge construction standards are superior to the ones on which the current FBF is based. Future standards will most likely be even more superior. Inferior structures should be posted and scheduled for replacement, while the trucking industry should be able to make the most efficient use of a system of which the majority of its structures are designed for loads greater than currently allowed.

Dump trucks of all types should be included in any Specialized Hauling Vehicle (SHV) definition that may allow for improved productivity for the group. They share the characteristics of disproportionately heavy tare weights necessary to provide the structural strength for on-off highway usage and hydraulic systems for unloading. They frequently run empty on the return trip. They must frequently maneuver in close clearance environments, and, most importantly, they must undergo the hazardous process of being raised into the air to unload.

DTIA has participated with NTWAC for several years in their effort to achieve a national permit system for SHV's. We believe that such a system would go a long way towards solving our problems with the FBF. We recommend that NTWAC's proposal to allow the states to create a SHV permit system, regardless of existing grandfather rights, for the Interstate Highway System and other federally funded highways be accepted.

Such a permit system with reciprocity among the states would contribute to the improvement of the total motor vehicle environment. It would allow the most efficient usage of existing vehicles which would in turn reduce the number of vehicle trips required to do the same job. This would then result in improved safety due to less exposure on the highway and the removal of the need to modify sound vehicle designs to attempt compliance that many times actually decreases a vehicle's ability to be operated safely. It would also reduce environmental damage due to less trips, improve the balance between infrastruture wear and tear and funding through the cost of permits and enforcement penalties, improve highway congestion, and reduce transportation costs that should be passed along to the consumer by the transportation users.

CONCLUSION

We believe that the entire "Bridge Formula" issue should be re-evaluated with every segment of the motor carrier industry represented and involved. Our segment of the motor carrier industry is tired of paying the price for "productivity increases" for the rest of the industry. Our operating safety is being compromised and our productivity destroyed.

DTIA requests that you adopt a new size and weight standard the takes all segments of the trucking industry into consideration. Increased costs should not be borne by all trucks when not all trucks share in the increased benefits of those costs. Current and future highway standards and capabilities should be recognized while inferior segments are protected and upgraded. All aspects of sizes and weights should be evaluated, especially the potential to reduce vehicle trips and exposures and the resulting impact on safety, the environment and costs. Specifically, NTWAC's permit system proposal should be accepted as one very important part to any new size and weight standard. Thank you.

Respectfully Submitted,
DUMP TRANSPORT INDUSTRIES
ASSOCIATION (DTIA)

PETER K. O'ROURKE

Statement of the
National Association of Governors' Highway Safety Representatives
before the
Surface Transportation Subcommittee
Public Works and Transportation Committee
U. S. House of Representatives
April 24, 1990

My name is Peter K. O'Rourke, Governor's Highway Safety Representative from California and Chairman of the National Association of Governors' Highway Safety Representatives (NAGHSR). NAGHSR is a non-profit association representing state highway safety offices. Its members are appointed by the Governor of each state and are responsible for developing and implementing their states' highway safety program. The organization's mission is to improve the safety of our nation's highways through increased safety belt and child restraint use; reduced incidence of impaired driving; stricter enforcement of speed limits; improved truck, school bus, motorcycle, bicycle, and pedestrian safety; safer vehicle design and enhanced roadway safety.

It is my pleasure to appear before you today on NAGHSR's behalf to discuss the reauthorization of federal highway safety programs.

Highway Safety: A Persistent Problem

Currently, the United States enjoys the best highway safety record of any country in the world. Over a twenty-year period from 1967-1987, the mileage death rate in this country dropped from 5.2 deaths to 2.4 deaths per 100 million miles of travel. (The 1989 mileage death rate has dropped to 2.2 which is the lowest mileage death rate to date.) In the last eight years alone, the death rate from motor vehicle crashes has been cut by more than 25%. The National Highway Traffic Safety Administration (NHTSA) estimates that, in 1988 alone, 6,506 lives were saved by highway safety laws and programs: 4,500 saved by safety belts; 1,148 saved by minimum drinking age laws; 608 saved by motorcycle helmets; and 250 saved by child restraints.

Despite the positive impact federal assistance and state and local highway safety programs have had on highway safety, motor vehicle deaths and injuries continue to be a major problem in this country. 47,093 people were killed in motor vehicle crashes in 1988--the last year for which complete statistics were available--and an estimated 3.4 million people were injured. (Preliminary estimates for 1989 indicate that the number of fatalities has dropped to 45,000.) Every 10 minutes there is a

traffic fatality and every 10 seconds, a traffic-related injury. The annual death rate from motor vehicle crashes is the equivalent of crashing an airliner with 129 persons on board every single day.

In 1988, half of the fatalities were alcohol-related (including pedestrians, non-drivers, and drivers whose blood alcohol level did not exceed the legal limit), 17,500 were unrestrained occupants, 6,900 were pedestrian fatalities, 13,585 involved light trucks, and 3,661 were motorcyclist (and other motorized cycles) fatalities.

The magnitude of motor vehicle injuries represents a major public health problem for the country. About one-third of all the unintentional injury deaths are caused by motor vehicle crashes. The leading cause of death for children and young persons aged 1-34 is motor vehicle crashes. For all ages, the motor vehicle injury death rate is surpassed only by the rates for heart disease, cancer and stroke. Traffic injuries are the leading cause of paraplegia and quadriplegia, and are a major cause of epilepsy.

The estimated economic cost of motor vehicle-related fatalities and injuries to society is staggering. According to the Cost of Injury in the United States (1989), the cost of motor vehicle crashes to society is $48.7 billion a year. This estimate, which many in the highway safety community believe is very conservative, does not include the non-quantifiable costs associated with human suffering and trauma, or societal costs associated with the long-term loss of productivity. Traffic injury costs, according to Injury Prevention: Meeting the Challenge (1989), are second only to cancer in their economic cost. Unlike cancer and other disabling diseases, however, most of the economic costs associated with motor vehicle deaths and injuries can be avoided through prudent investment of governmental and private sector resources in proven highway safety countermeasures.

If traffic continues to grow at about 4% per year in the future, as the Highway Users Federation projects, and if the 1987 mileage death rate of 2.4 deaths per 100 million miles of travel is maintained, then annual fatalities may exceed 60,000 by the year 2000 and may be as high as 80,000 by the year 2020. The rate would have to be dropped to 1.4 deaths per 100 million miles of travel just to maintain a fatality frequency of 46,000 fatalities a year -- a level which, in itself, represents a totally unacceptable loss of human life.

Increased truck travel, greater reliance on the automobile for commute trips, increased suburbanization and a deteriorating highway system will adversely impact the safety of the nation's highways over the next decade. More federal, state, and local and

private sector resources will have to be devoted to highway safety to reduce the fatality rate and to offset some of the demographic, social and economic trends of the future.

Current Federal Assistance Programs for Highway Safety

Much of the progress that has been made in highway safety can be attributed to federal highway safety legislation of the past twenty years (such as the Highway Safety Act of 1966) and the federal grant funds authorized by that legislation. The federal State and Community Highway Safety grant program (23 U.S.C. 402, commonly known as the 402 program) is the major source of funding for state highway safety programs.

Two major features make this federal grant program unique and contribute to its effectiveness. First, unlike other federal grant programs, the 402 program operates as federal "seed money" for state and local highway safety programs. 402 grants are available over a three-year period, with a declining federal match of 75%, 50%, and 25%. Highway safety programs funded with 402 funds are expected to be self-sufficient by the end of the third year; therefore, the 402 program does not encourage state dependency on federal grant assistance:

- In Kentucky, 402 funds were used from 1982-85 to create a Traffic Alcohol Patrol whose purpose was to increase DUI arrests in the Lexington area. The program, which resulted in a 300% increase in DUI arrests and a 35.8% reduction in alcohol-related accidents during Patrol hours, is still operating in the area despite the fact that no federal funds are involved.

- In Ohio, $4 of each motorcycle registration fee is used to fund a motorcycle safety training and education program. The program, which is supported by over $1 million in state funds, was initially funded by a 402 grant.

- In Puerto Rico, highway patrols have been established to complement ten existing traffic divisions in the Commonwealth. The project has combined federal 402 and state funds over a three-year period and will provide substantially increased funding for traffic safety enforcement. By the end of FY 90, the state will provide all funds to this program.

Second, states use 402 funds to leverage other state and local funds, private sector contributions, or voluntary assistance. In some cases, the leveraged funds (or in-kind assistance) equal to or exceed the federal grant. As a result, the 402 program is probably one of the most cost-effective grant programs provided by the federal government:

- Under Pennsylvania's Corridor Safety Initiative Program, the state has targeted a 17-mile stretch of Route 65 for an intensive combination of safety programs including highway improvement projects, coordinated enforcement efforts, increased public information and education programs, and advanced emergency medical services. 56% of the funding from this project comes from 402 funds and 44% is funded by the state.

- During FY 89, Virginia began a program to train police officers in selected jurisdictions to recognize drugged driving behavior. By the end of the fiscal year, there were 23 trained instructors, 47 trained enforcement officials, and 100% increase in drugged driving arrests. $71,000 in 402 funds were expended for the project, while the states and localities contributed approximately $500,000 in police time and laboratory analysis costs.

- In California, the state developed the "I'd Rather Drive" public information campaign with $150,000 in FY 89 402 funds and $125,000 in state funds. The campaign was designed to make young people aware of a new driver's license suspension law which affects those between the ages of 13 and 21 who have committed any drug and/or alcohol offense. The campaign has been so well received by the schools that the state plans to broaden distribution to theaters and private schools.

Federal 402 funds may be used to fund a wide range of projects including: occupant protection, impaired driving, police traffic services, motorcycle safety, roadway safety, traffic records, and emergency medical services. States may fund other types of highway safety projects, such as pedestrian and bicycle safety, if they submit additional justification and explanation to NHTSA.

Additional federal assistance is provided to states under the Federal Highway Administration (FHWA) 402 program which provides funds for traffic control device inventories, improved safety data collection and analysis systems, training and technical assistance and other activities.

Funds are also provided under the 403 program (23 U.S.C.403) for highway safety-related research and demonstration programs (which is a discretionary assistance program available to states, localities, universities, non-profit associations, etc.), and under the 408 and 410 incentive grant programs (23 U.S.C. 408, 410) for state drunk driving prevention programs. A small number of state highway safety offices receive truck safety assistance through the Motor Carrier Safety Assistance Program (MCSAP) and the Commercial Driver License (CDL) implementation grant program

which are administered by FHWA. A few state highway safety offices receive funds for drugged and drunk driving prevention programs under federal drug legislation.

Federal Highway Safety Program Impact

Over its twenty-year life, the 402 program (and other related programs) has had an extremely positive impact on highway safety in states and localities. In Missouri, for example, the fatality rate fell from 5.2 in 1971 to 2.4 in 1988 despite the fact that vehicle miles of travel increased 67.8%, population grew by 405,000 persons, registered vehicles increased by over 1 million, and licensed drivers increased by nearly 800,000 during that same time period. Although many factors have contributed to the decline in the fatality rate, the federal highway safety program has had a lasting and positive impact on traffic crashes in that state.

The 402 program has enabled Missouri to substantially upgrade its emergency medical services to a point where 88.1% of the most serious injuries were treated by paramedics in FY 89. Before the infusion of federal funds, emergency medical service in the state was little more than a "horizontal taxi" for victims of traffic crashes.

The program has also enabled Missouri to significantly improve its traffic record systems to better identify highway safety problem areas so that federal, state, and local resources could be targeted to those areas. With 402 and 403 funds, Missouri has been able to develop statistical programs which correlate emergency medical services, alcohol involvement, and traffic crash data. This has helped the state better evaluate the effectiveness of its highway safety programs and its emergency medical services.

The state has also successfully used 402 funds to leverage local funds for highway safety purposes. This has resulted in sustained local funding of highway safety programs, even after the federal funds are terminated. For example, in Cape Girardeau, 402 funds were used to establish a local highway safety committee which reviews and coordinates projects. The committee identified a particular pedestrian safety problem, obtained donated labor and materials which were used to address the problem, and did not utilize any federal funding. The federal funds created a permanent highway safety structure at the local level which, in turn, was instrumental in identifying a safety problem and solving it on its own.

Nearly every state can point to successes such as these. Without the federal funds, with shrinking state budgets, and with all the competing demands on state funds, few states would have the necessary resources to devote to highway safety. Highway safety

would simply not appear on most states' agenda if it were not for the federal grant programs.

Highway Safety Program Needs

1. Federal Role: NAGHSR believes that federal highway safety grant programs must be continued and expanded, given the projected future rate of fatalities over the next decade and the past successes which have been achieved as a result of those programs. An expanded federal commitment, along with support by the state and local governments and the private sector, will enable the implementation of improvements across the entire spectrum of highway safety.

We believe that the federal government should continue to provide leadership, as it has done this past year, in establishing highway safety goals and objectives. This would give the federal highway safety programs clearer direction and purpose and would more closely tie the efforts of the states and localities into a nationally coordinated program. We recommend that goal-setting should be done collaboratively with states, localities, highway safety organizations, and the private sector. We also suggest that the federal government should continue to be responsible for developing standards and criteria for programs and activities which will advance the national goals and objectives.

2. Non-construction highway safety programs: NAGHSR recommends that the NHTSA 402 program should be continued with no major programmatic changes. Federal funding should continue to be directed to highway safety information and education programs, program evaluation, data collection and analysis, training programs, and enforcement programs. The federal government should continue to set highway safety priorities but should be required to periodically review those priorities in order to address new and emerging highway safety issues and priorities. States should continue to be allowed to fund programs in non-priority areas.

We do recommend, however, that there should be some significant structural changes in the 402 program. We believe that the 402 program should be available on a two-tiered basis: a base tier and an incentive tier. The current 402 program should constitute the base tier. The incentive tier should be structured by combining and significantly expanding existing incentive grant programs (408 and 410) to provide financial incentives for a range of priority highway safety issues including, but not limited to, occupant protection, speed enforcement, impaired driving, pedestrian safety, motorcycle safety, trauma system development, and uniform data collection and analysis. Base program and incentive funds should be allocated to states according to the current population and road mileage-based formula.

In the first year, a state should be eligible for incentive funds if it qualifies under two or more of the incentive categories. A state should be eligible for subsequent funding if it continues to implement the previous year's program and qualifies under an additional incentive category in each subsequent year. We recommend that the two-tiered 402 program should be funded at **$250 million a year, $125 million in each tier.**

NAGHSR strongly supports the incentive approach and opposes sanctions. We believe that sanctions are counterproductive, are usually not targeted to the entity that is responsible for the failure to satisfy the mandated requirement, and generally do not relate to the programs that are being sanctioned. Incentives, on the other hand, would allow states to satisfy national performance criteria in a manner best suited to their needs and resources and would reward them for actual achievements in highway safety.

We also recommend that the Federal Highway Administration's 402 program should be continued and expanded. Since the proportion of mature drivers is expected to significantly increase in the next decade, funding for this program should be commensurately increased to at least **$25 million a year**, and the program should be focused more on the roadway safety needs of the mature driver (e.g. improved signage and improved roadway markings.)

3. Motor carrier safety programs. NAGHSR recommends that the federal motor carrier safety grant programs (MCSAP and the Commercial Drivers' License program) should be continued and funded at **$100 and $25-50 million a year, respectively.** We recommend that the MCSAP program should be adjusted to allow the funds to be used for motor carrier traffic safety enforcement purposes. This would help ensure that motor carriers obey the posted speed limit, do not drive impaired, are properly protected with occupant restraint systems, and comply with the rules of the road.

NAGHSR also suggests that MCSAP program administration should be shifted to NHTSA, the program should be incorporated into the base 402 program with no reduction in funding (bringing total funding up to $350 million), and the state highway safety office should be responsible for program implementation. This would allow states to address truck and passenger car safety issues within one program, would enable the MCSAP motor carrier traffic enforcement programs to be coordinated with other state traffic enforcement efforts in a state, and would eliminate the enormously frustrating problems of inter-agency coordination that exist at both the federal and state levels.

4. Data collection and analysis. NAGHSR recommends that a national data center should be established for the collection,

analysis and dissemination of uniform accident, injury and fatality data. In the long term, the center could integrate into a unified data system registration and licensing information, roadway engineering data, traffic volume data, traffic citation and conviction data as well as other data relating to driver characteristics. We recommend that **$25 million a year** be authorized for this purpose.

All states collect fatality and accident data and report it to NHTSA through the Fatal Accident Reporting System (FARS). However, the reliability and consistency of the data varies considerably from state to state. Most states have statewide data systems for some injury statistics (such as hospital discharge diagnoses). But not all states support a statewide EMS data system and no state presently supports a statewide computerized hospital emergency department data system. Only a handful of states have attempted to link accident and injury data bases.

A national data center could help the states address many of these problems. A center could improve the quality, standardization, and development of data reporting and analysis systems. A center could help states computerize their injury data and could provide technical assistance to states that wish to link data bases. A center could integrate existing data systems into one large unified system. A center could develop training programs to help state and local highway safety personnel in data collection and analysis and in new data processing technology.

5. Highway safety research. NAGHSR recommends that NHTSA's highway safety research efforts under the 403 program should be accelerated and funded at **$75 million a year**. The funds should be used, among other things, to evaluate the effectiveness of existing highway safety programs and countermeasures, to evaluate the effectiveness of vehicle safety standards already in place, and to develop future vehicle safety standards. Funds should also continue to be used to develop and demonstrate new highway safety program ideas, new countermeasures, and new and advanced highway safety technology.

Increased funding should also be provided to FHWA's 403 highway safety research program. The funds should continue to be used to identify roadway improvements which benefit safety. The research program should examine ways to more safely accommodate the changing vehicle mix through traffic control devices and other safety features. Additionally, the program should develop and demonstrate engineering projects which would improve pedestrian and bicycle safety and should address special issues such as the problem of parked vehicles on Interstate access roads.

6. Program administration. NAGHSR strongly recommends that there should be a single state agency that is responsible for

developing and implementing the federal highway safety programs. To this end, the state highway safety offices and Governor-appointed Highway Safety Representatives should continue to have primary responsibility for administering federal highway safety programs. They should continue to work cooperatively with local governments and private organizations to fund comprehensive highway safety programs at the state and substate levels.

Over the last twenty years, the Governor's Representative has changed from a grant administrator to a leader and coordinator of most of the highway safety activities within the state. In nearly every state, the Governor's Highway Safety Representative has become the keystone to highway safety in the state. GR's in the majority of states have taken on this broadened role and have done so successfully. For this reason, we believe that the Governor's Highway Safety Representative should continue to have primary responsibility for administering the federal grant highway safety grant programs.

Financing Federal Highway Safety Grant Programs

Presently, most of the federal highway safety grant programs are funded with revenues from the Highway Trust Fund. NAGHSR recommends that there should be no change in the funding source for these programs.

The Association strongly recommends that the unobligated balance in the Highway Trust Fund should be drawn down in order to allow the federal highway safety grant programs to be authorized at the levels we have recommended. Recent analysis by the Congressional Budget Office, the Federal Funds Information for States, and the Department of Transportation indicate that the Highway Trust Fund could support a much larger federal highway program without triggering the Byrd amendment or damaging the integrity of the program. We urge Congress to raise the obligation ceiling on the Highway Trust Fund and increase the level of spending so that needed highway safety programs can move forward and be implemented.

NAGHSR also strongly opposes efforts to use federal motor fuel tax revenues to support other non-transportation programs or to reduce the deficit reduction. Highway users pay federal gasoline taxes with the expectation that the revenues generated will be used for highway construction, maintenance and safety purposes. By allowing the diversion of federal motor fuel tax revenues, the federal government is violating the user fee principle upon which the federal highway and highway safety programs are based. This sort of diversion also weakens the ability of the Highway Trust Fund to support highway improvement and safety programs at a time when the need for increased investment in our nation's infrastructure and increased spending for safety is becoming more and more obvious. We support efforts to put the "trust" back

into the Trust Fund by spending the highway tax revenues for surface transportation improvement and safety purposes only.

Enforcement of the National Maximum Speed Limit

One of the issues which may be addressed in the reauthorization legislation concerns compliance with the national maximum speed limit. Current law considers states out of compliance if more than 50% of a state's motorists exceed the posted 55 mph speed limit. Noncompliant states may be forced to forfeit up to 10% of their primary, urban and secondary system funds. The sanctions do not apply to the forty states that have increased their speed limit to 65 mph. Furthermore, 55 mph states are required to monitor and report speed data to the Department of Transportation, while 65 mph are not.

This bifurcated approach to compliance has caused two inadvertent, potentially harmful consequences. For one, it has created a disincentive for states to retain their posted speeds at 55 mph and an incentive for states to raise their speed limits. Second, it has caused states with some of the lowest fatality rates in the nation to face severe sanction for failing to promote highway safety. In NAGHSR's viewpoint, the current compliance formula is not working and needs to be altered.

NAGHSR urges Congress to address this inequitable situation by:

- requiring <u>all</u> states to monitor and report speeds on all Interstate miles and to submit speed-related statistics to the Department of Transportation. This would generate the necessary data with which to determine whether or not increased speeds adversely impact safety;

- setting the compliance threshold on a state-by-state basis rather than a national basis. This would allow each state to measure progress against itself rather than against neighboring states whose conditions and resources may or may not be similar;

- developing a weighting scheme which would take into account the vehicle miles of travel within each state, the seriousness of the speed violation, the enforcement efforts undertaken by the state, and the relative safety of different types of highways. This would allow the formula to take other factors into account which affect speed compliance;

- giving the states maximum flexibility in the implementation of a compliance program, either by phasing in the compliance threshold over a multi-year period, or by adjusting the threshold by a fixed

percentage (e.g. 10 percent) in order to compensate for monitoring and sampling errors, or both strategies. This would give the states the flexibility they need to adjust to a revised compliance formula;

- establishing speed incentives encouraging states to increase and strengthen their efforts to enforce the national speed limit instead of sanctions for failing to enforce it.

This approach is consistent with the one recommended by the Government Accounting Office in its 1988 report to Congress and with the approach that was earlier considered by the Surface Transportation Subcommittee. NAGHSR believes that it would eliminate the inequities in the current formula while encouraging greater compliance.

Mr. Chairman, this concludes my remarks. I greatly appreciate the opportunity to appear before the Subcommittee and express NAGHSR's views on highway safety reauthorization issues. The Association has had an excellent working relationship with you and your capable staff, and we look forward to working collaboratively with you as a reauthorization proposal moves through the legislative process.

TESTIMONY
OF
AMERICAN INSURANCE ASSOCIATION
ALLLIANCE OF AMERICAN INSURERS
NATIONAL ASSOCIATION OF INDEPENDENT INSURERS
ON THE HIGHWAY REAUTHORIZATION BILL FOR 1990
BEFORE THE
SUBCOMMITTEE ON SURFACE TRANSPORTATION
OF THE COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION
UNITED STATES HOUSE OF REPRESENTATIVES
APRIL 24, 1990

PRESENTED
BY
DAVID F. SNYDER
AMERICAN INSURANCE ASSOCIATION

Mr. Chairman and Members of the Subcommittee:

My name is David Snyder, Counsel for the American Insurance Association. This testimony is submitted on behalf of the Alliance of American Insurers, the National Association of Independent Insurers, and the American Insurance Association which together represent more than 870 insurance companies providing approximately 2/3 of the commercial automobile insurance in the United States. Our associations and the insurance companies we represent have a direct humanitarian and economic stake in preventing commercial motor vehicle accidents and reducing the losses and rates that result from them. While this Subcommittee, the full Committee and the Congress, in general, have reason to be proud of the record on commercial motor vehicle safety, more needs to be done. That is why we are here today.

Consumer groups and insurers are united on the issue of truck safety. The combined program of major consumer and insurance groups, called the Agenda for Consumer Health and Safety includes these objectives: full implementation of the

commercial drivers' license program; enforcement of existing vehicle size and weight; mandation of antilock brakes and on-board recorders.

The public is concerned about the rising cost of auto insurance in some areas. So are we. Commercial auto insurance losses have increased 55% from 1984-1989. Liability losses, reflecting medical and lawsuit costs, increased a staggering 73% over the past 5 years. See charts 1 and 2. These losses simply must be reduced if we are to achieve stable or lower rates. Preventing the accident, death, injury and property damage in the first place is the best remedy for these rising losses and rising rates.

Insurers provide loss control services, base premiums on safety experience and support research on safety. For example, fleets are eligible for various forms of experience rating. Under these programs the premium is based on the actual experience of the policyholder and provides an immediate reward to the policyholder via lower premiums for good safety experience. Smaller risks are eligible for schedule rating, which can allow a big discount for such items as safety equipment. Insurers also fund the Insurance Institute for Highway Safety.

Insurers are required under state law to set up pools to insure virtually every applicant regardless of its condition or safety record. The losses in these pools are shared. So,

there are severe limits on our ability to police motor carrier safety. For this reason, government must help by setting minimum standards of motor carrier safety and equipment design and by assuring that they are enforced.

Each year nearly 4,500 people die and 170,000 are injured in tractor trailer crashes. If you are an occupant of a car involved in an accident with a tractor trailer, you are 38 times more likely to be killed than the truck occupants. Almost one third of truck drivers killed in accidents were found by a recent study to be under the influence of drugs, alcohol or both and fatigue was found to be an even more frequent contributing factor in the accidents. Partly as a result of this carnage, commercial auto insurance losses have increased 55% over the past five years. But as graphic as the numbers are, they pale in comparison to the human stories they represent. Here are just a few:

- I-90 Crash Kills Trucker -- Cab Separates From Trailer, Pitches Over Bridge. A truck driver was killed when the cab of his semi-trailer truck separated from its frame and pitched over a wall on the East Channel Bridge between Mercer Island and the East side. The cab landed 75 feet below the highway. There had been light rain just before. "He was sliding in the rain, he was trying to correct ..." according to a witness. (Excerpted from the Seattle Times, April 12, 1990.)

- Gloria Estefan Breaks Back in Crash. Gloria Estefan suffered a broken back ... when a tractor trailer plowed into their tour bus on a snowy highway in the Poconos. "The indirect cause was a tractor trailer which had jackknifed and blocked the road," said Corporal Joseph Kearney of the Pennsylvania

State Police in Scranton. "Everybody behind had to stop. It was like dominoes." A second tractor trailer moving at 45 mph came to a halt behind the first. Estefan's bus, directly behind, had stopped for about three minutes when a third tractor trailer plowed into her bus, state police said. Estefan's bus "took a pretty big hit. Their bus was pretty heavily damaged." "The trailer behind Gloria's bus just couldn't stop on the icy snow." (Excerpted from the New York Post, March 21, 1990.)

- Fiery Crash Kills Trailer Driver. A gasoline tanker driver was killed after he hit a dump truck... The 4:00 p.m. wreck closed 2 1/2 miles of U.S. 360 during the afternoon rush. The heavily traveled stretch was expected to open after 1 a.m. ...Fire rode the crest of the gasoline pouring from the tanker -- and enveloped a nearby restaurant. "He [the driver] was struggling to get through the broken windshield ... but the flames and heat were just too much ... we just had to let him go." The dump truck appeared to be slowing for a left turn when the tanker slammed on its airbrakes ... They locked together and that flipped [the gasoline tanker] and the dump truck. (Excerpted from the Richmond Times-Dispatch, April 19, 1990.)

- Siblings Die In Fire After Truck Hits Stalled Car on Interstate 95. As a Philadelphia mother watched helplessly, her two children, sitting in a stalled car on Interstate 95, were killed yesterday when a tractor trailer struck the vehicle from behind, dragging it 200 yards before the wreckage erupted into flames. A witness saw the mother running up the median of the Interstate toward the wreckage. "I heard her yelling, 'my babies, my babies, my children,'" he said. The two children were trapped inside the car, one in the front seat, one in the back. By the time firefighters extinguished the flames, the Honda was a shell. [The driver] escaped his flaming cab and hobbled to the side of the road. A witness and another bystander sat the driver down on the pavement. "His leg was hurt, and he kept saying, 'Oh my God, anybody in the car? Anybody in the car?'" The witness said "naturally, we didn't tell him ..." (Excerpted from The Philadephia Inquirer, April 12, 1990)

Although the goverment and private industry have worked to prevent these tragedies, still more must be done. In recent sessions, Congress has acted to improve truck and bus safety by passing the Surface Transportation Assistance Act of 1982, the

Commercial Motor Vehicle Safety Act of 1986, and the Truck and Bus Safety and Regulatory Reform Act of 1988. But speeds were also allowed to increase. The Federal Highway Administration has moved effectively to implement the 1986 law. But, there are apparently serious flaws in the U.S. DOT safety rating program and research and implementation of new technology by the Department is too slow.

Many states have responded well to the commercial drivers' license program, but the deadline for compliance threatens to overtake some major states which have not yet acted. The trucking industry has also done some positive things, such as joining in a petition to ban radar detectors from large trucks, and supporting anti-drug efforts, but has opposed required installation of new safety technology. Consumer groups have supported a host of safety measures. Insurers have worked for these same measures.

But, as the numbers and the human stories behind them illustrate, none of us have the right to be complacent. Here are a few necessary additional steps to help prevent, once and for all, the tragedies, the economic losses, and the higher insurance rates that result from avoidable big truck crashes.

Fully Implement the Commercial Drivers License Program

Four years ago the Congress enacted the Commercial Motor Vehicle Safety Act of 1986, a comprehensive law to: establish

a national commercial drivers' license system (CDL), prohibit truck and bus drivers from carrying more than one license, and severely punish serious moving violations such as driving under the influence of alcohol. The law reduced acceptable blood alcohol levels from .10 (the level in most states) to .04. We worked with the American Association of Motor Vehicle Administrators in drafting a model law for state implementation of the CDL statute and have worked for its passage. But because the federal law supplements, but does not supplant state licensing, the CDL program could collapse, without state action.

So far, more than 40 states have passed the necessary state CDL legislation and 12 are already issuing licenses. Despite this progress, ongoing Congressional oversight program is critical if the full benefits of the CDL program are to be realized. This oversight must be concerned not just with the quantity of states implementing the CDL program, but the quality of state efforts as well. For example, the CDL testing program would be worthless if the integrity of the testing process is not maintained.

Congress should keep the pressure on by preserving the 1993 and later year highway funds reductions for noncompliance as provided in the CDL law. Any indication of even the slightest possibility of extending this deadline could doom efforts to obtain 100% state participation in the CDL program by September 1992. We, therefore, ask the Congress to maintain

the deadlines and continue its oversight of the CDL program.

Freeze Allowable Truck Size and Weights

According to the Insurance Institute for Highway Safety, double trailer trucks are two to three times as likely as other configurations of big trucks to be in crashes. Double trailer trucks are also more likely than singles to jackknife in a crash. To function safely, longer and heavier trucks require longer stopping distances (thereby leading to more traffic congestion) and need much longer entrance and exit ramps (possibly requiring new highway construction). There is also strong evidence that heavier trucks will mean more damage to the roadways, further straining already stretched resources available to maintain our highways.

The public is strongly opposed to longer trucks being permitted on our highways. According to a public opinion survey, 92% of the public oppose allowing triple trailer trucks on the highways. Also, because of the insurance pools established in each of the states, the insurance industry, and indirectly all other commercial auto insurance policyholders, may have to pay for the increased numbers of accidents, damage, deaths and injuries that will surely result from longer vehicles.

For all of these reasons, we urge the Congress to block

any attempts to further increase allowable vehicle size and weight.

Improve DOT Safety Ratings Enforcement Program

State inspections are still turning up unsafe trucks with numbing frequency. For example, in a recent case, police ordered 60% of the pulled over trucks removed from service in one 12-hour period. While 70-80% had some sort of safety violation, one truck had only one working brake while hauling a 60,000 pound load (Chicago Tribune, February 5, 1990). The current DOT safety ratings program is not living up to its potential. Resources may not be adequate to the task and there may be insufficient follow-up with unsafe carriers to assure that problems are corrected.

S. 819, already passed by the U.S. Senate, contains language to improve the ratings program and to follow-up on unsafe operators. We urge the Congress to improve this safety program by enacting S. 819.

Mandate Antilock Brakes

A 1987 U.S. DOT report found that brakes may contribute to up to 1/3 of truck accidents. The remedies include antilock brakes, better maintenance and compatible systems. Antilock brakes are computer controlled barking systems that deliver the correct amount of braking power to each wheel, assuring

straight stops on even wet surfaces, while virtually eliminating jacknifing. The experience with current antilock brakes is so good that the European Economic Community will mandate antilock brakes on trucks by the end of 1991. The manager of a large truck fleet in the United Kingdom with years of experience using antilock brakes said "If we've lost a truck [with antilock brakes], we know nothing on earth would have saved it."

The initial cost of antilock brakes may be recovered in as little as two years because of fewer reportable accidents and related accident repairs, less down time and reduced insurance costs. In addition, tire wear can be reduced by antilock brakes -- in some cases by 15 to 20 percent. According to a manufacturer of antilock brakes: "One ... of our largest fleet customers has seen a total elimination of jackknife incidents and a 67% reduction in reportable accidents on his tractors equipped with ABS (antilock brakes) since the middle of 1988. That motor carrier told us that it will only buy ABS equipped tractors in the future and is looking at equipping all of its trailers with ABS." Tests on current antilock brake systems for tractor trailers confirm that they can bring a truck to a stop quickly and in a direct line, under conditions which would virtually guarantee a jackknife with other braking systems.

Yet, progress on mandating antilock brakes in this country has been far too slow. The Truck and Bus Safety and Regulatory Reform Act of 1988 required the United States Department of

Transportation (U.S. DOT) merely to report back to Congress after conducting studies. At the present time, the U.S. DOT will not even get around to considering whether antilock brakes ought to be required until well into the 1990s. Even at that point, there may be no action by the Department.

In view of the documented experience with antilock brakes in this and other countries, a timetable should be established by the Congress for mandating the installation of antilock brakes at least on new trucks. A regulatory deadline would be set by S. 819 and by amendments to S. 2393. We ask the House of Representatives to pass S. 819, as soon as possible.

Mandate On-Board Recorders

The National Transportation Safety Board (NTSB) recently concluded a study of the causes of accidents fatal to truck drivers. It found fatigue to be the most common probable accident cause (31%). Some truck drivers are under intense pressure to drive further, faster or longer than they can reasonably or safely do. Current hours of service regulation and record keeping are simply not protecting the drivers or the public.

A better way to validate and enforce hours of service and driver performance is clearly needed. Once again, the technological remedy is here, and is thoroughly validated: on-board recorders. These computer devices, which monitor

speed, braking and engine performance can help management achieve more productivity and fuel savings while providing drivers with protection against inappropriate pressure. Based on its findings in the truck driver fatal accident study, NTSB recommended that on-board recorders be required. We urge the Congress to set a regulatory deadline for mandating on-board recorders.

Conclusion

We urge the Congress to stand firm on the deadlines in the Commercial Motor Vehicle Safety Act of 1986, to continue oversight of the CDL program, and to hold the line on allowable vehicle size and weight. We urge the House of Representatives to approve S. 819, which includes important provisions on antilock brakes, drug use and U.S. DOT's safety rating and enforcement program. Finally, we urge the Congress to consider mandating antilock brakes and on-board recorders at least on all new commercial motor vehicles. In total, these measures will go a long way toward reducing the significant economic loss and countless human tragedies that result from preventable commercial motor vehicle accidents.

TESTIMONY BEFORE THE SURFACE TRANSPORTATION SUBCOMMITTEE

BY
DAVID SOILEAU
FEDERAL PROGRAMS ANALYST
TEXAS STATE DEPARTMENT OF
HIGHWAYS AND PUBLIC TRANSPORTATION

Good afternoon, Mr. Chairman and distinguished members of the Committee. The Texas State Department of Highways and Public Transportation appreciates the opportunity to participate with you in this important process of resshaping our federal surface transportation programs.

My name is David Soileau. I am Federal Programs Analyst for the Texas State Department of Highways and Public Transportation. We are responsible for the 77,000-mile state highway system in Texas, as well as for the State and Community Highway Safety (or Section 402) Program and the state-administered portions of the federal assistance program for public transportation. We also have responsibilities concerning the Gulf Intracoastal Waterway in Texas.

Texas today has a population of about 16 million people. We expect to reach a population of about 20 million during the next decade. Until 1940, we were a predominantly rural state -- about 80 percent of our people lived in rural areas. Today, however, that picture has reversed. About 80 percent of all Texans are urban residents. That means that we are about 5 percent more urbanized than the national average.

Texas has the largest highway system in the country -- about 305,000 miles of highways. We have about 14 million registered vehicles -- almost 1 vehicle for every Texan. Our highways carry about 150 billion vehicle miles of traffic annually.

We have as many miles of farm-to-market roads -- about 43,000 miles -- as there are miles of Interstate highways in the nation. The future of South Texas, as well as that of many rural areas in east and west Texas, rides on our farm road system. The people and products moving on this system bring the American values of mobility and economic prosperity to millions of Texans.

We also have more bridges -- about 46,500 -- than any other state in the country. Many of our rural areas are laced with rivers, creeks, and streams. Even in arid West Texas, many bridges cross areas that flood during heavy rainfall. Too many of those bridges -- particularly those on local roadways -- have deteriorated or are obsolete. We are concerned about the increased costs to our businesses from lengthy detours around these bridges. But we are perhaps more concerned about the increased risks our children and our sick families and friends face when our school buses and our emergency vehicles have to take these same detours.

As you all know, Texas had tremendous growth in the 1970's and early 1980's. In the mid-'80's, we suffered severe economic setbacks. Our oil industry suffered major losses, and freezes severely damaged the agricultural industry in our Rio Grande Valley. The last few years have brought new vitality to the Valley, however, in the form of the "maquilladores" or "twin plants" that have sprung up along the Texas-Mexico border.

The increasing urbanization of Texas, and the changes in our

Rio Grande Valley, demonstrate why we must continue to provide federal assistance to surface transportation, and why that assistance must reach out beyond today's Interstate highways. It also points up why Texans must receive a fairer return on their federal highway user fee dollar.

We agree with the American Association of State Highway and Transportation Officials (AASHTO) that the first federal priority should be to preserve the highway system we now have. To replace our 77,000 mile state-maintained network would take more than $100 billion. We can't afford to start from scratch. A national focus on preservation of our einvestment would allow state and local governments to concentrate on routine maintenance.

To better enable Texas to meet the challenges facing us, we believe that the new Federal-Aid Surface Transportation Assistance Act must do three things:

* RESTRUCTURE THE FEDERAL-STATE PARTNERSHIP AND THE CURRENT FEDERAL-AID PROGRAM
* REVISE THE FORMULAS THROUGH WHICH FEDERAL FUNDS ARE DISTRIBUTED TO THE STATES.
* INCREASE THE LEVEL OF FEDERAL TRANSPORTATION FUNDING BY PROTECTING THE FEDERAL TRANSPORTATION USER FEE CONCEPT.

We must have a simpler, more flexible federal program structure. The underlying responsibilities of the federal government for national defense, interstate and international commerce, and the safety and mobility of our people must

shape the federal role in transportation. However, federal involvement should support, not inhibit, the unique creativity and expertise that marks each of our states. Federal "red tape" should not keep our roadsand bridges from being upgraded. We have $5 billion in bridge work alone waiting to be done in Texas. We would like you to let us get on with it quickly.

We also agree that we must look at transportation more comprehensively. Highway planning must coordinated with rail and air systems, so that travelers can more efficiently move between transportation modes.

We join with the American Association of State Highway and Transportation Officials (AASHTO) in recommending a two-part program structure -- a "categorical" or "focused" program, and a "flexible" program -- for both highways and public transportation. This two-part structure would continue to address national needs, but would also allow states the flexibility to determine and address local needs.

We support the proposal for the designation of a highway System of National Significance, with the existing Interstate Highway System as its heart. That System of National Significance would connect our major cities and our seaports, border crossings, recreational areas, and defense facilities. It would also extend our principal national highway network to our new population and economic centers. The highway segments which make up that national network should be designated according to uniform national criteria,

and should meet uniform design and construction standards.

National interests in transportation extend beyond this national highway network, however. We also support AASHTO's proposal for a Flexible Highway Program providing support to the states to bring consistent safety and quality standards on those highway systems supporting the principal national network, and to provide smooth connections between the different transportation modes. Our highly competent state highway agencies should be given the flexibility to determine the best uses of limited resources to preserve and expand our transportation infrastructure.

As an aside, the Clean Air bills now being considered by Congress contain serious limits to state flexibility. Last week you heard from several sources, including AASHTO and the National Association of Regional Councils, concerning those dangers. We urge you to consider their testimony. Beyond that, ws can only ask you to remember that our national policies concerning clean air and transportation should be mutually re-enforcing, and should seek to meet clean air and energy goals in ways that are consistent with transportation's primary contribution to mobility and economic competitiveness.

Texas agrees with AASHTO's recommendation that federal transportation funds should be divided equally between the System of National Significance Program and the Flexible Highway Program.

The Flexible Highway Program pursues objectives that are predominantly related to the state and local transportation system. Thus, Texas agrees with AASHTO that transfer of funds between states is inappropriate for that program. Each state should simply be allocated a pro rata share of total Flexible Highway Program funds, based upon its share of total federal highway user contributions to the Highway Trust Fund.

The System of National Significance Categorical Program would be driven by national interests. Its funding should therefore be driven by factors that correlate well with those national interests. Texas supports AASHTO's recommendation that the formula for the state-by-state distribution of SONS Program funds use the following factors:

* Total statewide urban and rural lane miles
* Total statewide urban and rural vehicle miles travelled

However, we go further. With the other members of the Crescent Coalition -- from whom you have already heard -- we believe that the funding formula for the SONS program should reflect the network's contribution to interstate commerce. We believe that is reflected in the intensity of heavy truck travel, and we believe that the best measure of truck travel is diesel fuel consumption. We support the Crescent Coalition's distribution formula based on those three factors.

We also believe it is critical that the factors in the SONS funding formula be "decoupled" from the specific roadway

segments included in the SONS.

Texas agrees with AASHTO that the level of federal investment in highways and public transportation must be increased. Almost 80 percent of Texans oppose any reduction in highway expenditures.

Today, Texas receives almost a billion dollars a year in federal highway funding. But that's only about 80 percent of our federal user fee payments into the Highway Trust fund, and only about a third of my department's annual budget. And our total funding from all sources -- state and federal -- will cover only about 60% of our identified highway needs.

We do not believe, however, that an increase in federal highway user fees is necessary at this time to increase the federal investment. We believe with AASHTO thatthere should be no increase in federal highway user fees until four conditions are satisfied:

* REAFFIRM THE DEDICATION OF CURRENT AND FUTURE FEDERAL HIGHWAY USER FEE RECEIPTS TO TRANSPORTATION PURPOSES. KEEP "TRUST" IN THE HIGHWAY TRUST FUND. More than 70 percent of Texans oppose using highway funds for non-highway purposes. A record number of voters agreed to amend the state constitution to dedicate federal highway reimbursement dollars to highway use.

* MAKE THE FULL BALANCE OF THE HIGHWAY TRUST FUND AVAILABLE TO THE STATES FOR OBLIGATION.

REPEAL THE EXEMPTION OF ETHANOL-BLENDED GASOHOL AND OTHER ALTERNATIVE FUELS FROM THE FEDERAL EXCISE TAX ON MOTOR FUELS. This "free ride" for certain highway users has cost the Highway Trust Fund more than $3 billion since 1979. The Clean Air bills you are now considering would only increase that diversion.

* IMPROVE THE EFFECTIVENESS OF FEDERAL MOTOR FUEL TAX COLLECTION.

Thank you, Mr. Chairman and members of the Committee. We appreciate the opportunity to testify before you today, and will be happy to answer any questions you may have.

TESTIMONY OF FRANKLIN WHITE, COMMISSIONER
NEW YORK STATE DEPARTMENT OF TRANSPORTATION
BEFORE THE
SURFACE TRANSPORTATION SUBCOMMITTEE
HOUSE COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION

We want to thank the subcommittee for giving us the opportunity to present our views on the reauthorization of the Federal Surface Transportation programs. New York State has been extremely active in the activities undertaken as part of the American Association of State Highway and Transportation Officials (AASHTO) Transportation 2020 Program. We support the recommendations which have been developed and agreed to by AASHTO on reauthorizing Federal transportation programs. We have also created a group of chief transportation officials in the New York Metropolitan area - called the Bi-State Forum - to emphasize to this committee and others the transportation concerns of our nation's largest urbanized area. While we generally support the views and recommendations of both these groups, I am here today to highlight the issues of particular concern and importance to New York State.

The imminent completion of the Interstate Highway System and the issuance of Secretary Skinner's National Transportation Policy Report make this an opportune time to review and restructure the Federal transportation programs to meet the nation's changing surface transportation needs. Discussion of the Federal role and participation in transportation funding and the other major issues which must be addressed in hearings such as these will allow ample time for analysis, public debate and development of a consensus before Congress must act on the reauthorization.

Let me begin by commenting on the National Transportation Policy issued by Secretary Skinner last month. That policy was expected to define the direction and goals of our vital transportation systems and present the objectives that would underlie the reauthorization of the Federal Surface Transportation Act.

We, in the transportation field, have great admiration for Secretary Skinner's willingness to undertake a task this large in so difficult a political and budgetary environment. Irrespective of the outcome, and whatever your view of the outcome, the Secretary clearly deserves credit for engaging the debate. Having said that, those of us who work with the Federal transportation programs also had high expectations for the policy statement. While there is much in the statement that lives up to our expectations and that we can strongly endorse and support, there are also aspects that give us concern.

Although the policy calls for a healthier partnership with the states and localities, we are concerned that implementation of such a policy will certainly make the state and local partners ill. That is so for a couple of reasons. The first is the continued decline in the Federal commitment to shoulder an appropriate share of transportation costs. Over the last ten years, the Federal share of highway and transit expenditures has declined by one third. The net result has been a dramatic growth of over 160 percent in highway and transit expenditures

by state and local governments. In my own state, state funding for our highway and transit programs has increased from $350 million in 1980 to over $1.76 billion by 1989, while the Federal contribution has remained constant at about $1 billion in the face of growing needs. Thus, New York State, and most other states, are doing at least their share of maintaining the Federal-State-local partnership. Attached for the record is a copy of a report prepared for Governor Cuomo which documents this disturbing trend.

The second reason for concern with the policy is the lack of any strategy or commitment to arrest this disturbing trend. Nothing in the policy report suggests that this will happen.

In order to understand the implication of the national transportation policy, one has only to look at the administration's proposed budget for Federal fiscal year 1990-91. Under that budget, New York State would stand to lose nearly $200 million in Federal transportation aid, $15 million in highway aid and about $185 million in transit assistance. Under present budgetary constraints in New York, it will be virtually impossible to replace these needed transportation funds from state sources.

Turning from the general to the specific, there are a number of issues which must be addressed in the new Surface Transportation Act which are of particular interest and concern to New York State. The resolution of these few issues are critical for us to continue to rehabilitate our transportation infrastructure and provide safe and efficient transportation services.

Funding Levels

Although all of the states need additional transportation resources, in working with the other states through our Association of State Highway and Transportation Officials, we determined that it was irresponsible to simply ask for more money without considering the impact on the Federal budget deficit. So it was decided to take a very responsible middle ground. In a broad consensus with the other states, we believe that Federal highway and transit assistance should increase, but it should increase gradually over a four to five year period. We view the next Surface Transportation Act as a transition from present programs and funding levels to the new programs and financing that will be needed in the 21st century.

The preferred method of providing the increased Federal funds would be by spending down the balances in the Highway and Mass Transit Accounts of the Highway Trust Fund to the extent the Byrd Amendment allows. However, the National Transportation Policy does not promise to do so. The most reasonable approach was rejected for obvious reasons unrelated to transportation finance.

We do not have to spend much time discussing the Trust Fund balances. All of you are aware that a total of $16 billion has been accumulated for highway and transit. These funds were provided by the users and should be returned to them. You have heard from the nation's Governors asking that highway and transit authorizations be increased to spend the accumulated revenues in these trust funds. We in New York believe that this, at a minimum, should be done.

Highway Funding Formulas

Just as important as funding levels for Federal programs are the formulas used to allocate this funding to states or localities. Funding formulas should equitably meet highway needs. Given the amount of Federal funding to be allocated and its importance, formulas should be based on accurate, easily collected and verifiable statistics. Simple formulas which are fair and equitable are much preferred over complex formulas with many factors based upon statistics which may not be reliably or consistently reported or bear a relationship to transportation needs. If formulas are developed to allocate funds for a National System of Highways, we believe it would be appropriate for these formulas to reflect the needs and use of the highway system to be financed.

However, if the formulas are not tied to a specified highway system, then formulas based on statewide, verifiable and easily obtainable data should be used. We strongly support formulas that include available, verifiable and consistently reported factors such as population and highway mileage although we are concerned with the potential for large scale underreporting of population in our major urban areas in the 1990 census. My staff is currently working on development of such a formula.

There are proposals currently circulating which advocate placing a disproportionate weight on a factor to represent truck usage. While no one disputes the fact that trucks contribute to the wear and tear on our highways, there currently is no accurate, consistently reported and verifiable measure of truck usage which is being collected at the state level by FHWA or anyone else. As a surrogate for truck usage, it has been proposed that diesel fuel sales be used as a major factor for apportionment of funds. We believe diesel fuel sales is not a reliable measure of truck use or location of truck travel, and should be dismissed because of its inaccuracy and the inconsistency of reporting.

There are several reasons diesel fuel sales is not an accurate measure for transportation purposes. It is difficult to accurately separate diesel fuel use for home heating purposes from transportation purposes. Diesel fuel can be used for a number of non-highway transportation or tax exempt purposes, such as for farm use, buses or municipal government vehicles. Location of sales does not match location of use; diesel sales in one state are often miles traveled in another state. Finally, the mileage tax on trucks, which attempts to allocate fuel usage based on mileage traveled, is not completely enforced or audited, resulting in inaccurate data.

If some measure of truck usage is eventually determined necessary in future apportionment formulas, then a more accurate and verifiable statistic than available today should be developed. Further, if the factor is being used to apportion funds to a particular system of highways in each state, then the factor should reflect the relative use of that highway system by trucks, rather than statewide truck usage. Before any measure of truck use is chosen to apportion funds, FHWA should be charged with developing a reliable and verifiable statistic on relative truck usage on the highway system for which the funding is intended.

Transit Funding Formulas

Formulas to allocate Federal transit assistance should reflect the varying needs of public transportation in our nation's urban and rural areas. The current formulas for allocating transit assistance, which represent a balance of existing transit service and population factors, should be retained. These formulas were developed after considerable negotiation leading up to the Surface Transportation Assistance Act of 1982.

The committee should be aware that the transit assistance received under these formulas is not totally equitable to New York. This state has one-third of all public transportation users in the nation and provides about one-quarter of national vehicle miles of service. New York's use of public transportation measurably lowers our nation's gasoline usage and vehicle emissions. While current Federal transit formulas do not fully reflect New York's public transportation needs, they are a reasonable compromise and should be continued.

Increase Federal Bridge Program

Although a significant number of bridges have been improved in recent years under the Federal bridge replacement and rehabilitation program and the regular Federal-aid programs, the nation's bridge improvement needs remain extensive. As of June, 1988, 135,826 were classified as structurally deficient and another 138,418 as functionally obsolete.

Despite the obligation of over $16 billion in Federal aid since 1982 for replacement and rehabilitation of bridges, we were barely able to keep up with the rate of deterioration over the 1982 to June, 1988 period. While there was a slight reduction in the total number of deficient and obsolete bridges during the period, the proportion of Interstate bridges classified as deficient rose from 10.6 percent in 1982, to 15.9 percent in June, 1988. On other arterial highways, 25.8 percent of bridges were classified as deficient in 1982, with the proportion rising to 28.5 percent by June, 1988. Clearly, the present Federal program, funded at $1.6 billion annually, is not keeping up with the rate of decay of our nation's most important bridges.

In New York we have programmed the rehabilitation or replacement of almost 1800 bridges at a cost of over $4.5 billion over the next five years. The Federal Highway Administration estimates that nationally, an investment of $4.9 billion annually (1987 dollars) is needed just to maintain the present overall conditions. If inflation is considered, the annual cost will be $6.3 billion by 1992. If Federal funds are appropriated to meet just one-half the identified needs, at least $3 billion annually must be appropriated for continuation of the Federal Highway Bridge Replacement and Rehabilitation Program.

While routine bridge needs can probably be addressed by each state using their formula apportionments of an expanded Federal bridge program, there is a need to ensure that the states can and will finance the needed rehabilitation or replacement of major structures, which, because of their high costs, might not be fundable under an annual formula apportionment.

Since 1978, the states have identified 217 large deficient bridges (total cost over $6 billion) which are too costly to replace or rehabilitate from formula apportionments of Federal funds and have requested funding for these projects from the existing Discretionary Highway Bridge Replacement and Rehabilitation Program. Through September 30, 1988, the FHWA was only able to provide initial funding for 107 of the identified projects in 42 states, leaving over 110 of these costly projects without an identified source of funding. The list of large, costly bridges which will age and deteriorate over the next few years and require replacement or rehabilitation can be expected to grow.

The present discretionary bridge program funded at $225 million annually, is clearly not enough to take care of these large bridges. The new legislation should set aside at least $350 million annually for a discretionary bridge replacement and rehabilitation program growing to $500 million. The rehabilitation or replacement of deficient bridges on any public highway costing more than $20 million or 20 percent of any state's annual apportionments for the proposed Categorical and Flexible Highway Programs, whichever is less, should be eligible for funding under the program.

Complete the Interstate Trade-In Substitution Program

The Interstate Trade-In Program was enacted by Congress to allow states and localities to substitute an alternative highway or public transportation facility in lieu of constructing a non-essential segment of the Interstate System. The program is nearing completion. By the end of 1991, only five or six states will still be owed major amounts of Interstate Trade-In substitute highway funding. This program will require about one additional year of funding in the new act at about current apportionment levels (about $750 million). These funds, as well

as previously provided funds, should be available for obligation until expended. As the program moves toward completion, it makes little sense to have funds lapse and be reallocated to other states which have substitute projects ready. The two year limit on availability should be removed.

In addition to the highway substitution program, it is likely that there will be several states still owed significant sums after FFY 1991 under the transit trade-in program. This program is vital to a number of major metropolitan areas for rehabilitating their transit infrastructure and relieving congestion and will also require an additional authorization to complete the promised program.

Payment for Unobligated Balances

Since the mid-1980's, annual obligation limits on the Federal highway program have been set considerably below annual authorization levels. This has resulted in the accumulation of significant unobligated balances by the states, which will reach about $10 billion by the end of FFY 1991. The Federal Highway Administration has indicated that they may suggest that the first year of the new Act be treated as a "Transition Year" to allow states to use these unobligated amounts. Under this proposal, it is suggested that the only new authorizations in FFY 1992 would be to complete the Interstate and Interstate Substitution Programs (about $4.5 billion). The states would also be allowed to obligate all of their backlogged unobligated balances, totaling about $10 billion, during the year. Balances not obligated in the transition year would lapse.

Implementation of this proposal would create havoc and would result in an even larger balance in the Highway Trust Fund. The states should be permitted to obligate these accumulated unobligated balances in a manner in which they can be appropriately used over the normal four year lapsing period on non-interstate balances. This will result in these unobligated balances being eliminated by the end of FFY 1994 through the normal programming process. Given the magnitude of unmet highway needs, these funds should be in addition to, and not in lieu of, full annual apportionments.

Flexibility in Use of Federal Funds

In the National Transportation Policy, Secretary Skinner calls for greater flexibility in the use of transportation funds so that the most cost-effective solutions can be implemented. He also cites the importance of maintaining our transportation infrastructure. We strongly support these objectives. States should have the flexibility to use Federal funds for preventive maintenance activities, where these activities preserve our bridges and pavements and help prevent later, more costly major reconstruction. A timely expenditure of a small amount of Federal funds for preventive maintenance will be returned many times over in the resultant increased life of facilities and reduced reconstruction costs.

Highway Safety

The safety of our nation's highways are of utmost concern to all of us. Studies have found that the 55 miles-per-hour speed limit reduces accidents and we in New York State are committed to maintaining this speed limit on our highways. We also support the national speed monitoring program to gauge compliance with the 55 miles-per-hour speed limit. However, the current sanctions imposed on states not complying the the 55 miles-per-hour speed limit are not equitable and, we believe, counterproductive.

The major reason for enforcing speed limits is to improve safety. There are a number of highway safety related programs which can have as much or more impact on saving lives as complying with the 55 miles-per-hour speed limit. Programs such as mandatory seatbelt use and child restraint, tough drunk-driving laws and their enforcement, and mandatory motorcycle helmet requirements all reduce the potential for serious accidents and save lives.

If highway safety is a main reason that Congress called for monitoring of the 55 miles-per-hour speed limit, then we believe that rather than measuring just compliance with the speed limit, a factor measuring the overall impact of a state's highway safety effort should be included. Also, rather than withholding funds from a state not in compliance, these funds should be transferred to safety related programs. We have been working with several other states on developing a way to include an overall highway safety measure in the national speed limit monitoring program.

In addition, there is no reason why speed limit monitoring and sanctions should only apply to highways posted at 55 miles-per-hour. Compliance on highways with speed limits above 55 miles-per-hour should also be included in the monitoring program.

Transit Must Be Given Equal Treatment With Highways

Nothing is more important to the New York Metropolitan area, and many other large urban areas nationwide, than an efficient transit system. We estimate that travel will increase 50% in the New York Metropolitan region between 1990 and 2015. It is not possible for the existing transportation system in the region to absorb this increase in trips. If we do not plan now to accommodate this travel demand, the growth in travel will paralyze the region.

The only way we can hope to cope with expected future travel in our densely developed urban areas is by getting people to use mass transit in place of automobiles. There just is not sufficient space to build the highways necessary to carry the expected travel growth. We need to make transit the preferred transportation alternative in large metropolitan regions.

To help allow this to happen, and to treat transit equally with highways, we must change the present law which allows unlimited automobile parking costs to be treated as business expenses and therefore tax deductible, but only allows a maximum of $15 per month to be deducted for employer provided transit expenses. We need to raise the transit incentive immediately to at least $60 a month as is proposed in H.R. 494 introduced by Congressman Rangel, so that people will voluntarily choose to use transit and thus help meet the growing travel needs of the future. Clearly to the extent that transit use can be encouraged, we will have the added benefit of improving the air quality in our metropolitan areas.

Summary

In conclusion, the major issues which confront this committee in reauthorizing Federal Surface Transportation programs consist of the following:

- Providing adequate highway, bridge and transit financing;
- Allocating this funding by formulas which are simple, based on accurate and verifiable data, and meet the transportation needs of states and localities;
- Increasing the Federal bridge program to reduce the number of deficient bridges and help states meet critical bridge needs;
- Funding the Interstate Trade-In Substitution highway and transit programs to completion;
- Funding the unobligated highway balances over the period of the next Act, rather than in a "Transition Year";
- Allowing Federal highway funds to be used for preventive maintenance activities;
- Adding a measure of overall safety to the national speed limit monitoring program; and,
- Treating transit on an equal basis as highways.

While there are many other issues which needed to be discussed as part of the reauthorization of our Surface Transportation programs, these are the major issues of concern to New York State. I would like to again thank the subcommittee for this opportunity to present New York's views. We stand ready to help this committee as we proceed through this critically important reauthorization process.

Memorandum

STATE OF NEW YORK
WASHINGTON OFFICE

March 8, 1990

TO: Governor Mario M. Cuomo

FR: Brad C. Johnson

RE: The Shrinking Federal Commitment to Highway and Transit Financing During the 1980's

Introduction

This memorandum analyzes the shift in funding for the nation's highways and mass transit systems during the 1980's.

Despite the general acknowledgment that the United States faces a potential transportation infrastructure crisis -- safety, capacity, and financing -- federal financial support for the nation's highway and transit systems increased only marginally during the 1980's. At the same time, state and local governments more than doubled the amounts they invested in those systems.

As the decade progressed we witnessed a shift in the actual amounts that each level of government invested in highways and mass transit. For example, in 1980 the federal government spent 39% more for highway capital improvements than state and local governments; yet by the end of the decade, states and locals were investing 36% more than the federal government.

There was an even greater erosion in federal support for mass transit. In 1980 federal transit funding exceeded state and local spending by 22%; eight years later, state and local transit outlays surpassed federal investment by 243%.

Overall, the federal share of highway capital and total transit funding was 34% higher than the state and local share in 1980; as the decade ended, state and local investment exceeded federal by 63%.

Federal surface transportation programs are scheduled for reauthorization in 1991. It will be imperative to effect a reverse in the decade-long retreat in federal transportation financing.

Highways

Recognizing the need to complete a national Interstate, Primary, and Secondary highway system to facilitate the safe, efficient transport of people and goods, the federal government assumed the major role in the federal/state/local partnership responsible for the construction and improvement of the nation's highways. By the end of the 1970's, the federal government was providing, from federal highway user taxes, approximately 58% of the funds spent nationally for the capital improvement of highways (Attachment A).

Even with the major increase in federal highway user revenues derived from the five-cent increase in gasoline taxes, by 1987 the federal government had become the junior partner in the partnership providing funding for the capital improvement of highways and bridges. By 1989, the federal share of funding for capital improvements had eroded to only 42%, and had fallen from 30% to 21% of total disbursements for highways. During the decade federal highway capital funding grew from $11.8 billion to $15.1 billion (28%) -- even though the federal gas tax had risen by 125%. Meanwhile, state and local investment increased by 141%, from $8.5 billion to $20.5 billion (Attachment B). In other words, in 1980 the federal government contributed 39% more for highway capital improvements than state and local governments; yet by the end of the decade, states and locals were investing 36% more than the federal government.

Attachment C illustrates the total amounts of highway disbursements, including maintenance and operation, throughout the decade. (The federal government provides capital assistance, but not funding for maintenance and operation.)

In their attempt to keep up with the increasing costs of operating, maintaining, and improving state highway systems in the face of a shrinking federal share of the cost, most states substantially increased motor fuel taxes. Between 1980 and 1990, 47 states increased motor fuel taxes an average of 88% (about 8 cents per gallon). Nineteen states more than doubled their gasoline taxes over the decade. In 1980 the highest rate in any state was 11 cents per gallon; ten years later the rate was over 20 cents per gallon in twelve states.

Rather than raising fuel taxes to make up for increasing costs and the shortfall in federal aid, some states, like New York, Alabama, and Louisiana, issued state bonds for financing substantial portions of their highway capital programs. The amount of highway bonds issued by the states each year more than quadrupled, from about $724 million in 1980 to a peak of almost $3.3 billion by 1987. New York alone has authorized the sale of about $4 billion in bonds to finance a substantial portion of the State's highway capital program.

Mass Transit

Beginning in 1964, the federal government assumed a lead role in financing public transportation. The landmark Surface Transportation Assistance Act of 1978 increased federal transit authorization levels to fund: rehabilitation and modernization of the long neglected transit infrastructure; needed new capacity in growing metropolitan areas; and expanded funding to small cities and rural areas. Needed federal support for mass transit increased until 1981, when it reached $3.3 billion for capital costs and 17% of transit operating costs nationwide; however, federal operating assistance now funds only 6% of operating expenses nationwide.

Since 1981, federal transit operating and capital aid have each declined annually except for the increase in capital funding in 1983 as a result of dedication to transit of one-cent of the five-cent federal gas tax increase. In 1980 federal aid comprised about 55% of total governmental funding for transit operating and capital needs; by 1988, the federal share had fallen to 23% (Attachment D).

Attachment E illustrates that point another way. While federal transit investment shrank by 23% during the decade, state and local contributions soared by 222%. This chart shows that in 1980 federal transit funding exceeded state and local spending by 22%; by 1988, state and local transit outlays surpassed federal investment by 243%.

The decline in federal participation over the past ten years has led to large increases in contributions by the other levels of government and transit users. The average transit fare nationwide in 1980 was about 31 cents. By 1988, the average fare had doubled. Over the same period, the state and local government share rose from 40% of operating cost coverage to 53% (Attachment F).

New York State Impact

Attachment G shows that the federal share of New York's highway construction program fell from 68% to 44% during the 1980's, while State spending increased by 254%: $161 million to $570 million (Attachment H).

New York transit funding in the '80's skyrocketed by an incredible 531%, but federal support for State transit systems shrank by almost 18% (Attachment I). During that same period, the federal share of total transit assistance in New York State dropped from 78% to 32% (Attachment J).

We are not asking the federal government to replace state and local transportation financing. Nor are we able to assume the entire burden. All we ask is that the federal government remain a full and participating member of the "stronger, healthier partnership among federal, state and local governments" that the National Transportation Policy envisions.

SURFACE TRANSPORTATION REAUTHORIZATION

April 24, 1990

Good morning, Mr. Chairman. I appreciate the invitation to come before you today to discuss Governors' concerns about reauthorization of surface transportation programs.

We are all aware of the challenges confronting the nation's surface transportation system. We have deteriorating bridges -- what some call "baby boom" bridges because so many were constructed during the first years of that generation and the beginnings of the Interstate highway system. We have congested metropolitan areas with overburdened highways, inadequate public transportation facilities and services, and inefficient intermodal connections. We have whole areas of our states without essential access to the benefits of a high quality surface transportation system. The situation has never been so critical.

Transportation has been a prerequisite to economic progress since this country first began and that principle is no less true today. Our economic performance is tied to the quality of our transportation services and facilities. To address the challenge before us, we will have to harness all the resources of the federal, state, local, and private sector to revitalize our transportation infrastructure.

Productivity Investment

The National Governors' Association recognizes that Congress is seeking to overcome the hardships posed by a federal budget deficit. Deficit reduction measures are absolutely essential to sustain economic recovery and we will all have to make sacrifices. However, as you work towards this goal, we ask that you recognize the importance of addressing what has become known as the "third deficit" -- the deficiency of public investment in our people and our economic infrastructure.

The National Governors' Association supports preferred budget treatment for carefully designated "productivity investments." These are investments that make clear and direct contributions to national productivity. Along with human resources development, investing in physical infrastructure is key to increasing both our international competitiveness and long-run economic growth.

Also essential to improved productivity is our nation's commitment to research and development. Although the transportation field is so obviously receptive to new technologies, it has fallen behind other areas such as defense, health, and space exploration in the development and application of new technologies. Further enhancement of research and development programs will undoubtedly bring forth the application of newer and more efficient technologies; more finely-tuned methods of information collection and management; and a greater number of more qualified personnel, especially in the technical fields related to management of transportation facilities and services.

Encouraging research and development in transportation is just one of the policy principles included in comprehensive surface transportation policy unanimously adopted at the winter meeting of the National Governors' Association. The entire policy position is submitted for your consideration as you begin to develop authorizing legislation for the surface transportation programs. I want to focus on several key features of our position, particularly as they relate to the administration's National Transportation Policy.

Sustained Federal Commitment

State and local governments provide the vast majority of support for transportation and have expanded their financial commitment substantially over the last decade. While that state commitment will continue, the federal government must also increase its contributions in order to meet enormous unmet needs. This does not necessarily require a tax increase or any new money. The first step must be full utilization of the balances in the Highway Trust Fund.

Project 15. Virtually every Governor supports the goal of setting the highway obligation ceiling for fiscal 1991 at $15 billion. We have communicated that in a letter sent to Budget and Appropriations Committee leadership signed by 47 Governors. Committee Chairman Kay Orr and I also wrote personally to each member of the Budget and Appropriations Committees, spelling out the impact of the change on each of their states.

Setting the obligation ceiling at a level equal to annual trust funds receipts, including interest, is both fair and fiscally possible. It would provide a direct parallel between annual receipts and the basic state highway programs covered by the obligation ceiling. Total obligations for the federal highway program would be some $16 billion-$17 billion annually -- the total of the $15 billion obligation ceiling, plus the cost of programs outside the obligation ceiling (estimated at $1.8 billion for fiscal 1991).

As to fiscal responsibility, the Highway Trust Fund's cash balance, plus projected receipts, includes more than enough room for raising the obligation ceiling to $15 billion. This represents a 25 percent increase in obligations. The U.S. Department of Transportation has conceded that a 35 percent increase in obligations is possible. This has been reinforced by the General Accounting Office, whose testimony you have heard.

Setting the obligation ceiling at $15 billion is a good middle ground between what we have now and what is both necessary and possible under the law. According to the Congressional Budget Office, fiscal 1991 outlays would increase by only $390 million over the CBO baseline. This is less than one-half of the $920 million interest earned on the balance in the trust fund during fiscal 1991 (chart 3).

When Speaker Tom Foley met with us during the NGA winter meeting, he told us that he is in favor of exhausting the trust fund and committing to investment in infrastructure to insure our competitive future. "The failure to spend the funds accumulated in those trust funds might make the budget look smaller," he said, "but they imperil our long-term economic health by robbing us of the foundations of that prosperity."

The speaker was right. This money was not collected to be held as a repository to offset the true size of the federal budget deficit. It was collected with the reasonable expectation of new and better roads. By raising the obligation ceiling and allowing access to funds that should be spent as intended for the betterment of our ailing transportation system, Congress will be restoring "trust" to the transportation trust funds.

Federal Matching Rates. The National Transportation Policy developed by Secretary Sam Skinner calls for increased investment in transportation infrastructure, but proposes to shift the financial responsibility more to states and localities. Specifically DOT would like to lower the federal matching share on federal projects to secure greater leverage on state, local, and private sector funds.

When Secretary Skinner talks about the high federal contribution to individual projects -- ranging from 75 percent to 90 percent -- this is only part of the picture. As you know, state and local governments now provide almost 80 percent of total surface transportation spending (chart 2). States and localities contribute $63 billion of the $82 billion total. Requiring additional state money on federal projects would have a number of consequences that would reduce the effectiveness of the federal program.

First, increasing the state matching share would divert money from maintenance and state projects on the remainder of the nation's four million miles of roadway. These are many of the streets, roads, and bridges that provide vital service to your constituents and mine, vital service that could decline with deferred maintenance.

Second, a number of states currently have exhausted their ability to raise fuel taxes. In the past five years, 39 states have raised their highway taxes, some more than once (chart 4). The gasoline tax rates in 11 states have now reached or exceeded 29 cents per gallon, including the 9-cent federal tax (chart 3).

Third, increasing the state matching share would create a hardship on some states where tax capacity is insufficient to produce revenue needed to cover the additional matching requirements. The revenue from a 1-cent per gallon tax is different from state to state. (Kentucky and Texas charge the same gasoline tax, for example. But the revenue collected in Texas from the same level of tax is five times greater.)

Fourth, expanding federal review and federal requirements to more projects would raise their cost for the states and create additional workload for the Federal Highway Administration staff. Reducing the cost of federal review should be a goal for reform of the program.

Strong Federal-State Partnership

The federal-state alliance that created and built the Interstate highway system grew out of a strong consensus on the need for a national program of highway development. This partnership is one in which the federal government has taken the lead in setting a broad national policy framework and providing financing to assist the states. And the states have built the highway system, which they own and operate.

We are now at a crossroads. The current consensus among the transportation community is that a substantial federal role should continue in setting broad national policy development and providing financing. There is also substantial consensus on the need to reassess the federal role in the implementation of the program.

We believe it is time to initiate a transition into a new federal aid highway program that will address federal investment priorities while providing the flexibility needed by the states. This includes developing a funding allocation system for states that is rational, equitable, and predictable. It should serve identified national policy priorities, but it should include a reassessment of the appropriate federal role in decisionmaking and programmatic review.

States, through cooperative action with the local governments, can establish the transportation facilities and service priorities of their citizens. And with the support of a federal funding structure that recognizes the value of a national transportation system, states should be given greater flexibility within broad program categories in the new programs to administer federal funds to address these critical priorities. We can make maximum use of limited resources, through simplified administrative procedures and more flexible state funding options.

Finally, Governors have worked hard to promote voluntary state efforts to achieve regulatory and procedural uniformity. We will strongly oppose the imposition of uniform procedures in truck registration and taxation programs in states. We will just as strongly oppose preemption of state authority over sources of state revenues, state tax bases, or taxation methods. In short, Governors believe that incentives to encourage achievement of national goals are more effective and productive than preemption and prescription.

Thank you for the opportunity to testify. In moving toward developing a surface transportation reauthorization program, you are forging a strategy that will have a profound effect for the remainder of the decade and the next century. We are ready to roll up our sleeves and work with you to implement a fair distribution of the burden we will all face in addressing the challenges confronting the nation's transportation system.

F- 1. TRANSPORTATION POLICY OVERVIEW

1.1 **Preface**

1.2 **Transportation Planning**

1.3 **Transportation Finance**

1.4 **Operation**

1.5 **Regulation**

1.6 **Surface Transportation Policy Principles**

The nation's Governors support comprehensive efforts to develop a new national transportation policy to meet America's needs into the twenty-first century. Safe, efficient, convenient, cost-effective, and environmentally sensitive transportation is essential for maintaining and improving mobility for people and for transporting goods in commerce. Adequate investment in transportation infrastructure is critical to the economic vitality, international competitiveness, and national defense interests of the United States.

The Governors pledge a partnership with Congress and the administration to develop and implement new national transportation policy to meet current and emerging challenges facing the nation. The comprehensive, multimodal national transportation strategy developed by the U.S. Department of Transportation will help focus the nation's attention on critical investment priorities. Having reviewed policy recommendations developed by the American Association of State Highway and Transportation Officials, the Transportation Alternatives Group, and others, the Governors have developed policy principles to provide guidance in formulating new federal transportation authorization legislation.

1.6.1 **Overriding Principles**

1.6.1.1 **Continue a Significant Federal Role.** A safe and efficient transportation system is a key element for national economic prosperity. The Governors call for the continuation of a significant federal role in assisting the states in financing highway and transit projects to meet national transportation goals.

1.6.1.2 **Increase Investment in Transportation.** Greater investment in transportation infrastructure is critical to preserving the United States' productivity and competitive position in a global economy. Flexibility to respond to both reinvestment and capacity expansion should be a primary feature of a new transportation program. States and local governments provide the vast majority of support for transportation and have expanded their financial commitment over the last decade. While the state commitment will continue -- along with securing greater private financing for transportation improvements -- the federal government must also increase its contributions in order to meet the enormous needs. An appropriate first step would be full utilization of the balances in the highway and transit accounts of the Highway Trust Fund. This would leverage even more state, local, and private dollars for an overall higher investment level.

1.6.1.3 **Restore Trust in the Transportation Trust Fund.** All dedicated user fees, as well as trust fund interest, should be promptly distributed for their intended purposes. These collected funds are urgently needed to maintain and improve the condition and safety of the nation's highways, bridges, and transit systems. The Governors call on Congress and the administration to restore "trust" in the transportation trust funds by promptly spending down the cash balances. Annual obligation ceilings should be set no lower than annual trust fund receipts, including interest.

1.6.1.4 **Protect Trust Fund Revenue Sources.** All existing and future diversions, deductions, and exemptions should be carefully considered for their impact on transportation user fee revenues. Clean Air Act requirements serve broad social goals and should be supported by broad-based financing mechanisms. The Governors also urge renewed efforts directed toward collecting the millions of dollars in user fees that are lost each year through tax evasion.

1.6.1.5 **Increase Flexibility in New Transportation Programs.** The Governors urge that the states be given greater flexibility within broad program categories in the new highway and public transportation improvement programs to administer federal funds to address their critical priorities and obtain the best value for each investment. States need greater flexibility to make maximum use of limited resources, through simplified administrative procedures and more flexible state funding options. Governors oppose the direct earmarking of funds for demonstration projects. In addition, Governors urge voluntary state efforts to achieve regulatory and procedural uniformity and would oppose preemption of state authority over sources of state revenues, state tax bases, or taxation methods. The Governors also recommend that federal restrictions limiting tax-exempt bond financing be removed to facilitate additional capital financing.

1.6.1.6 **Improve Safety.** Safety must be a major consideration in any transportation investment. The Governors are especially concerned about safety on the nation's highways, where the highest number of deaths and injuries occur, and support strengthened safety programs, such as those to curtail drunken and drugged driving, promote seat belt use, enforce speed limits, and improve accident data collection and analysis.

1.6.1.7 **Strengthen Commitment to Research and Technology Development.** Ongoing research, development, and technology transfer is a basic prerequisite to maintaining a high-quality transportation system. The federal government must exercise leadership by expanding financing for research and development and must take the lead in disseminating results, in close cooperation with the states and private industry. Coordinated efforts also are required to ensure an adequately trained workforce for planning, designing, constructing, and operating transportation systems.

1.6.1.8 **Improve Intermodal Linkage.** The Governors recognize the importance of improved intermodal connections to making the nation's total transportation network more efficient and competitive. States are well situated to take on the complex challenge of multimodal coordination because of the states' broad involvement in statewide transportation planning and programming. The federal government should reduce or remove federal impediments and restrictions to multimodal coordination and should actively encourage innovation in this area.

1.6.1.9 **Increase Private Sector Involvement.** The Governors will continue to seek opportunities for private involvement and financing of transportation services and infrastructure investments to augment public funding and facilitate individual projects. The federal government can promote joint private-public transportation ventures by removing hindrances in such areas as tax law and program restrictions. The Governors oppose federal prescriptive mandates on privatization, such as quotas for private sector involvement.

1.6.1.10 **Use Incentives, Not Sanctions.** The Governors believe strongly that incentives to encourage achievement of national goals are more effective and productive than sanctions. The Governors oppose the use of sanctions and urge the use of federal incentives to stimulate states to adopt federal standards.

1.6.2 **Highway Transportation.** The Governors believe that it is time to initiate a transition into a new federal aid highway program that will address federal investment priorities while providing the flexibility needed by the states. This would include development of a system of funding allocation to states that is rational, equitable, and predictable to serve identified national policy priorities. Renegotiation of the state-federal partnership should include a reassessment of the appropriate federal role in decisionmaking and programmatic review.

As part of the transition, some provision should be made to enable timely completion of essential Interstate projects. However, with completion of the Interstate program, the main focus of the federal program should address current and future national highway needs. All available

highway dollars should be spent immediately to improve the nation's highways and bridges. At a minimum, the highway obligation ceiling should be set no lower than annual trust fund receipts, including interest. The new federal highway program should address the following.

1.6.2.1 **Preserve and Improve Interstate System and other Highways of National Significance.** The highest priority for the new federal program must be preserving and improving the nation's aging interstates and other highways of national significance. Keeping this network in top condition is critical for the nation's economic vitality. It is essential that federal spending for interstate and other highways of national significance be increased as the commitment to complete the Interstate system is fulfilled.

1.6.2.2 **Rehabilitate and Replace Bridges.** The safety of the nation's bridges is of paramount importance requiring special attention. The federal program must ensure that adequate resources are available for this critical infrastructure need.

1.6.2.3 **Reduce Urban and Suburban Congestion.** Mobility in urban and suburban areas has emerged as one of the most critical concerns in the nation. The Governors are keenly aware of the economic costs of congestion in terms of lost productive time and higher shipping costs. Efficiency improvements and additional capacity are urgently needed in the nation's urban and suburban areas. The states must play a strong role in programming these funds, since they are in the best position to take a systemwide, strategic approach to congestion relief and to coordinate transportation priorities among various jurisdictions through broad planning and programming mechanisms.

1.6.2.4 **Reconnect Rural America.** Improved highway access is key to expanding economic opportunity in rural areas. Strategically placed new rural highway arteries and capacity and access improvements to the existing network are needed to connect existing and potential rural production centers with national and international markets and to accommodate increased heavy truck traffic. Given the regional and national economic interests served by improving rural access, a federal commitment is needed.

1.6.2.5 **Enhance Safety.** Safety considerations should be an integral part of every aspect of the new federal highway program, including efforts to promote safety improvements in vehicles and roadway operations. Driver safety can be enhanced through education and enforcement of laws such as the minimum drinking age, driving under the influence of alcohol and drugs, seat belt use, and commercial drivers licensing. Greater program support is needed to reduce the number of accidents involving hazardous materials.

1.6.3 **Public Transportation.** Public transportation is an integral part of the nation's surface transportation network. In major urban areas, mass transit is indispensable to the daily movement of large numbers of people. In smaller urban and rural areas, public transportation provides critical mobility for access to employment and essential human services.

Public transportation serves multiple and overlapping social, energy, and environmental needs in addition to the direct transportation needs. States have steadily increased funding over recent years, so that state support now exceeds federal support. The Governors also recognize the essential role of the private sector, especially in providing specialized transit service and intercity bus service. The Governors believe, however, that financial support for public transportation remains primarily a public responsibility and recommend that a strong federal role continue in partnership with the states, cities, rural areas, and private sector. Priorities for new public transportation legislation should be as follows.

1.6.3.1 **Restore and Strengthen the Federal Funding Commitment.** The current level of federal, state, and local spending for public transportation is inadequate even for maintaining existing facilities and service. The funding gap widens with the cost to upgrade the condition of the nation's bus and rail car fleets, to increase those fleets in order to maintain transit's current market share, and to fund new rail transit systems and high occupancy vehicle or busway projects. The Governors urge that the federal funding commitment be restored and strengthened commensurate with the existing and growing needs. Private sector participation in meeting our public transportation needs should be secured to enhance the limited public resources. It cannot, however, replace public sector funding.

1.6.3.2 **Provide Federal Revenues from Fuel Tax and General Fund.** Given the multiple goals served by public transportation, it is appropriate that federal funding support be continued from the general fund as well as the Mass Transit Account of the Highway Trust Fund. While the current base level of funding for major capital projects should be retained, the Governors also support using a portion of increased spending from the Mass Transit Account under a more broad-based distribution

mechanism for a broadened definition of eligible projects to serve a variety of public transportation needs among the states.

1.6.3.3 **Increase Flexibility.** The Governors urge that federal public transportation programs be flexible enough to allow states and local areas to target funds to where they are needed most and provide the greatest benefits. In urban areas, the states are often in the best position to provide leadership in forging effective partnerships among highway and transit interests for comprehensive and strategic solutions to congestion problems. The federal operating role in the largest urbanized areas should be maintained at current levels. The capital investment needs of large urbanized areas are significant and should be funded to allow for increased mobility. In the medium and small urbanized areas as well as rural areas, where capital needs are smaller and local revenue sources to cover operating costs are very limited, states and local transit systems should have broad flexibility to use federal funding assistance for operating costs.

The Honorable Pete V. Domenici
Ranking Minority Member, Budget
United States Senate
Washington, D.C. 20510

Dear Chairmen and Ranking Minority Members:

We are writing to urge your support in setting the Highway Trust Fund obligation ceiling at $15 billion. This level of spending is fully supported by the amount of gas tax revenues expected to flow into the Highway Trust Fund this year.

Countless infrastructure studies and reports have accurately documented the pressing problems every state faces in meeting the growing maintenance and rehabilitation needs of highways and bridges. There is no question that the financial resources required to sufficiently address the problem are great and that states will continue to bear the major responsibility for funding. However, at a time when highway and bridge needs are critical and expenditures inadequate, gas tax revenues continue to accumulate in the Highway Trust Fund.

Setting the highway obligation ceiling at $12 billion, as the President has recommended, will cut highway spending in FY 1991 by $240 million and deprive taxpayers of some $3 billion worth of transportation improvements they are paying for at the gas pump this year.

We recognize the budgetary problems this country faces but we also recognize the need to invest in the future. Taxes collected from highways users should be spent on transportation improvements and not to disguise the federal deficit. By setting the Highway Trust Fund obligation ceiling at $15 billion you will take a major step toward putting the public "trust" back into the transportation trust funds.

We know you share our concern about the relationship between this nation's economic performance and our commitment to transportation investment. Your assistance to the states in meeting that investment responsibility by increasing the highway obligation ceiling to $15 billion is greatly appreciated.

REAUTHORIZATION OF THE POST-INTERSTATE SURFACE TRANSPORTATION PROGRAMS

MONDAY, JULY 2, 1990

HOUSE OF REPRESENTATIVES,
SUBCOMMITTEE ON SURFACE TRANSPORTATION,
COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION,
Long Beach, CA.

The subcommittee met, pursuant to notice, at 10:15 a.m., at the Long Beach Council Chambers, 333 West Ocean Boulevard, Long Beach, California, Hon. Norman Mineta, presiding.

Mr. MINETA. The Subcommittee on Surface Transportation of the House Committee on Public Works and Transportation will please come to order.

We are pleased to have this opportunity to be in Long Beach at the first of our Regional Hearings to be held across the country.

At this time I would like to yield to the very distinguished Congressman Glenn M. Anderson, the Chairman of the full Committee on Public Works and Transportation, in whose home area we are now located. I know that all of you know Glenn. He needs no introduction, but he does deserve one.

He is a person who is a very, very, fine Member of the Congress who represents his district very, very well and we are proud to have Glenn as the Chair of the our House Committee on Public Works and Transportation.

The ranking Republican Member, Congressman John Paul Hammerschmidt of Arkansas was not able to be here but between John Paul and Glenn they make a great team and we are just pleased to have this opportunity to start these regional hearings here in Long Beach, California.

I am pleased to yield to Chairman Anderson.

Mr. Anderson.

Mr. ANDERSON. Thank you, Norm. I am very pleased to join Congressman Mineta and my colleagues on the Public Works Committee, Mr. Packard and Mr. Hastert, distinguished local officials around here, as well as those of you in the audience.

This is the first in a series of hearings which will examine the effectiveness of our Federal Highway and Transit Programs in meetings surface transportation needs across the entire country.

Southern California has such tremendous transportation needs, which parallel the needs of many other cities across the country, and it is perhaps fitting that we begin these hearings here in Long Beach.

These transportation needs would be even greater if we did not have to address the severe air quality problem from which Southern California suffers. In this context, increasing the use of transit and other shared ride modes of transportation, will prove vitally important. And addressing these problems would generate additional demands on already limited state and federal surface transportation funds.

However, if we design most interstate surface transportation programs, which effectively meet these needs, we can help to insure the continued economic success of Southern California as well as the continued economic success of our nation.

As most of you know, I served as Chairman of this Surface Transportation Committee for several years, so I understand the tough job that Chairman Mineta and the other Members of our committee will have in meeting this challenge. That is why I am especially looking forward to hearing what each of the witnesses have to say throughout the day. Their advise and counsel will enable us to mold surface transportation programs which will keep pace with southern California's needs as we are propelled into the twenty-first century. We must keep pace or surely our economic growth will strangle us rather than be the tremendous benefit to us which it promises to be.

In addition to the increased funding, we must increase the efficiency of our existing transportation capacity by promoting policies such as intermodalism, which will assist the free flow of goods and traffic. And I am very pleased that Southern California has been a leader in this regard. We must also insure the continued safety of our highways and transit systems.

And in conclusion, let me welcome all of you to Long Beach on such a beautiful southern California day and say once again how pleased I am to be here.

Thank you Mr. Mineta.

Mr. MINETA. Thank you very much, Mr. Chairman. We are pleased to have with us Congressman Dennis J. Hastert of the 14th District of Illinois as well as our very fine colleague from California from the 43rd District from Carlsbad, Congressman Ron Packard.

Today the Subcommittee on Surface Transportation begins its schedule of field hearings to help determine the sum and substance of federal aid highway mass transit and highway safety programs once the current programs expire on September 30, 1991.

During the past 34 years, Americans have enjoyed a tremendous federal investment of more than $270 billion in our nation's transportation systems. We have built more than road and bridges interstates and mass transit systems; what we have built is a way of life that has sustained the American people and fortified our economy. But what about tomorrow? Especially in such high growth high mobility states such as California.

For tomorrow, we must make certain that Americans can travel in safety. We most move people and goods in a way that will improve the quality of our air and our overall quality of life. We must leave no doubt in the minds of our children that we will act consistently and with foresight.

Americans now travel more than 2 trillion miles on our highways each year. In the future, that level will only rise. And yet it

is estimated that as a nation we will need to invest $95 billion annually just to maintain the current level of service through the year 2020.

The question is, Where will we get the money and how should we use it? Clearly the strong partnership that already exists among the American people, business, industry and all levels of government will be called upon to meet the challenges of building and rebuilding our transportation systems. But at the same time, we must never lose sight of the fact that how we spend that money is as important as how much money we spend.

More than a year ago, the Surface Transportation Subcommittee sent a legislative agenda to build the transportation future America wants and needs. We have conducted hearings in Washington, DC. We have received expert testimony, but the health and well-being of our transportation network requires more hands-on input than any series of Washington hearings could provide. That's why we are here in California today.

It is also fitting that we begin our field hearings here in Long Beach, in view of the major role that has been played by your own Representative Congressman Glenn Anderson, Chairman of the Full Committee on Public Works and Transportation. As all of you know, Glenn Anderson was instrumental in the development of the 1987 Surface Transportation Act and continues to play a leading role towards the development of new legislation that will affect California specifically as well as our nation in general.

Transportation is an overwhelming concern here in this state. Just a month ago, Californians voted decisively to increase the state tax on gasoline to fund transportation projects and in so doing sent a very strong message to the rest of the nation. That message is this: under-funding our transportation needs may once have made fiscal sense for the sake of short-term fiscal relief. But under-funding in the future could be economic suicide in the new world which values butter more than it does guns.

In the 1960's and the 1970's we spent more than 2.3 percent of our annual gross national product on transportation projects. In the 1980's that level had shrunk to four tenths of 1 percent.

The result was congestion on our highways and decay of our mass transit systems. And the lesson is clear: transportation programs must never again be under-funded as they have been in the recent past. In the 1990's I believe the key to finding solutions to our nation's transportation problems will be to define the appropriate federal role. I believe that federal role must take into account State and local needs, program flexibility and the right of people who have paid taxes into the transportation trust funds to get what they paid for and not see those funds idle away at the same time that there is talk of increasing the federal gas tax.

Through this hearing, and those to follow, I am confident that we will further our efforts to determine what the federal role should be in the future and how we get from where we are today.

Let me thank again all the witnesses who will be appearing before us today for taking time from their own busy schedule to share with us their own expertise, and to offer a special thanks to the Long Beach City Council for allowing us to use this very fine facility.

And at this time I would like to yield to our very fine colleague Congressman Ron Packard.

Mr. PACKARD. Thank you, Mr. Chairman, and good morning, ladies and gentleman.

We have a very distinguished group of witnesses today for which we are very grateful that you have come. We're looking forward to your testimony. As the Chairman, Mr. Mineta mentioned, this is a major undertaking that we're beginning at this time. We have just completed the 35 years—it was designed to be a 30 year transportation plan, but it has been extended five years and we're just completing now and we will see the sunset of the existing long-term transportation plan that began back in 1954.

That is unquestionably the most significant and profound public works project in the history of the world. The interstate system that laces this country and criss-crosses and allows people to move and goods to move in this country has done more for the economic strength of the United States than any single issue that I know of. That will sunset next year. The funding will sunset for that plan and for our transportation program next year so it is incumbent upon our committee and upon this country to develop a new plan, a new 30 year plan and to develop a new funding program. That's what we are undertaking and beginning today.

We are very pleased to be in Glenn Anderson's district, one of the highlights of my service in the Congress has been the privilege I have had of working with Glenn Anderson. For as long as I have served in the Congress I have been privileged to serve on this committee. Glenn has truly been one of our transportation leaders as well as Mr. Mineta who is now our Chairman of the Surface Transportation Subcommittee.

And I think we recognize that if we as California Representatives can solve our problems here in California, our transportation problems, gridlock and the concerns that we have on our freeways and highways and streets, it will probably be a good prototype to solve the problems of the country. I do not know of any problem that exists in this country that we do not see here in California or in some part of our state.

So I am looking forward to the days testimony that will help inaugurate this effort to develop a new transportation plan that will take us at least through the year 2020, for the next 30 years.

There is so much we have to do. It is not a question anymore, I do not believe, of putting new ribbons of freeways across this country and within our counties and cities. I think it is more looking for a broad based solution to our problems. High technology will certainly be involved in solving our transportation problems of the future, smart highways, smart vehicles, alternative fuels, mass transportation systems, high speed rail; there is so much that we will have to address in our next transportation plan that we did not have to deal with—or certainly we did not deal with in the previous plan.

And so, we have a great opportunity, I think, before us to develop a plan that is going to lead this country and our communities into the twenty-first century with high tech solutions on the highways in our mass transit systems; in our airport systems and someway blend our total transportation program under one major plan.

That won't be a small undertaking. I think each of us who serve on this committee and subcommittee recognize the mammoth task before us. Because we are not going to be able to use the benchmarks and the procedures and the processes that we have used in the past. We have new problems but we also have new technology that should help us to solve our problems.

I want to pay particular attention to the fact that Mr. Tom Riley, one of my favorite supervisors in Orange County is with us and will testify. And many of you as I have read through your testimony and looked over the list of witnesses I could not believe we would have such a distinguished list of witnesses today. Welcome, we look forward to your testimony and thank you Mr. Chairman for the opportunity to address the group.

Mr. MINETA. I yield time to our very distinguished colleague from the 14th District of Illinois, Congressman Dennis Hastert of Yorkville, Illinois.

Mr. HASTERT. Thank you Mr. Chairman.

Certainly this experience of being here today sets off a whole series of hearings that we will be having on the reauthorization of the highway act. I want to particularly commend Norm Mineta, the Chairman of the Subcommittee on Surface Transportation—certainly Glenn Anderson, who is the Chairman of the whole Committee of Public Works and Transportation, for taking the leadership to start to focus in on the problems that we have across this country.

How are we going to start to reshape and refocus on what are the problems of transportation, not just in the 1990's but into the next century? And I wiil take my hat off to these two gentlemen who have shown great leadership in this committee and certainly we feel very, very comfortable with them leading us into the next decade.

So without any further adieu and with the deference to the many honored people that we have here today to testify before us look forward to it. I thank the gentlemen, both the Chairman of the subcommittee and Chairman of the full committee for bringing these hearings into being and looking forward to getting them going.

Thank you sir.

Mr. MINETA. Thank you. I would like to forward at this time Mr. Hunt Braly, Chief Deputy to the Honorable Ed Davis, California State Senator from the City of Agoura Hills.

Mr. Braly, California State Senator Davis' full statement will go ahead and be made a part of the record so if you would go ahead and proceed in your own fashion sir.

[Statement of Senator Davis appears on page 2158.]

TESTIMONY OF HUNT BRALY, CHIEF DEPUTY TO HON. ED DAVIS, CALIFORNIA STATE SENATOR, AGOURA HILLS, CA

Mr. BRALY. Thank you Chairman Mineta and other Congressmen. I apologize for Senator Davis not being able to be here this morning but he is in Sacramento because of the continuing budget crisis up there. It is my privilege to be here this morning.

I will not read his statement since you have a copy of it. Let me just try to paraphrase what his interest has been in the desire to return the control of billboards back to local government.

Senator Davis has represented the Agoura Hills and the Northern L.A. County, Ventura County, part of California in the State Senate since 1980. He has been interested for a long time in returning control to local governments. We have the 101 freeway which is the gateway to the Santa Monica Mountains National Recreation area, which goes through our district along with Interstate 5 up through Northern L.A. County.

In our attempts to restore some scenic beauty to this area, Senator Davis introduced legislation two years ago to designate the 101 freeway from the San Fernando Valley up to Santa Barbara County as a scenic highway. That law has passed and is now on the state books. However, local government must take several steps to get that scenic highway designation. And one is to have some reasonable methods to control outdoor advertising.

However, under federal law, the local cities in our district cannot do anything other than paying whatever is considered the fair market value for billboards within 660 feet of the freeway. This has led to billboard companies basically putting some very large, $500,000 values on billboards. The city of Agoura Hills, for example, has 30 billboards. That city of 18,000 certainly cannot afford to pay that type of money.

At the same point in time though, current state law, and federal law allows cities to amortize pole signs. Those large signs we see for gas stations or McDonalds or what have you. The city of Agoura Hills has done that, those signs will be coming down within the next several years.

Senator Davis thinks it is important to note that previously the Federal Government did allow local cities to amortize billboards, when it was changed in 1978 it was with the understanding the Federal Government would help pay 75 percent of the cost of these billboards. That has not been happening since 1982. Because of that situation, Senator Davis would strongly urge you to return local control over this important issue to the local citizens, so they can decide for themselves how to deal with these signs which are not conforming to what their community wants and desires.

Thank you very much.

Mr. MINETA. Thank you very much, Mr. Braly. Congressman Anderson.

Mr. ANDERSON. Yes, I have got a couple of questions, I think. Mr. Braly, in your testimony you state that the problem facing the city of Agoura Hills—is it the Federal Highway Beautification Act, makes it financially impossible for a local government to enact reasonable sign ordinances which remove billboards within 660 feet of a freeway?

Other than the use of amortization, are there any other suggestions for compensating owners of non-conforming billboards that would not impose a financial burden on local government?

Mr. BRALY. Not that we have been able to determine. After Senator Davis introduced the Scenic Highway bill and it was passed we went back to Sacramento to attempt to find ways of dealing with this situation because when they would negotiate with local bill-

board companies they would get figures without any verification that we could find $500,000 per billboard. And that is when we determined that the Federal Government had the final say so. That seems to be, in our studies, the two ways you go. You amortize it, in the case of pole signs and in this state, it is over seven years, or you pay whatever the fair market value is.

Mr. ANDERSON. Senator Ed Davis, I believe has supported legislation in the state senate to allow local governments to compensate the billboard owners by amortizing billboards over a seven year period. And the Congress in H.R. 3389, the Billboard Control Act of 1989, pending before the Subcommittee of Surface Transportation, provides for a five year amortization period. Now what criteria then, should be considered in determining whether amortization should be used to compensate owners of non-conforming billboards and the amortization period?

Mr. BRALY. We picked the seven year period because that is what has been used to pole signs and in this state seems to have worked well, it seems to have been equitable, gives a long period of time for the signs to still be up, for revenue to be received by the billboard companies and a reasonable period of time for them to be removed.

Mr. ANDERSON. This will be my last one and then we will let somebody else ask questions.

Mr. Braly, the existing provisions of the Highway Beautification Act require the payment of just compensation, that could be cash, for the removal of non-conforming billboards along interstate and primary highways.

However, the Congress has not provided federal funds for the payment of just compensation since 1982. Now if the Congress authorized funds for the payment of just compensation for the removal of the non-conforming billboards, would local government still support provisions that would provide for amortization as the means to compensate owners of non-conforming billboards?

Mr. BRALY. I think local government's concern and Senator Davis' concern would be what would happen year after year after year as we continue to have budget situations in Washington. If you return it to the local governments and let them decide then we'll have a no federal expenditure of money and we'll have a clear answer of how you can deal with these non-conforming uses.

Mr. ANDERSON. Thank you Mr. Chairman.

Mr. MINETA. Mr. Braly, I take it your concern is about the freeway 101 as it winds itself through the Santa Monica mountains in this instance. In the Fiscal Year 1990 the Transportation Appropriations Act, the Congress appropriated funds for a study of scenic highways. The 101 freeway through the states of Washington, Oregon, and California has been identified for inclusion as a part of the National Scenic Highways.

What impact do you think there would be of a Federal National Scenic Highways program and what kind of impact would that have on local governments within the 101 freeway corridor?

Mr. BRALY. If they are still not able to get rid of non-conforming billboards, like the city of Agoura Hills with 30 of them, they can have the designation like we gave them in Sacramento but not be able to do the other steps from beautification and taking care of

the signs that are needed to get the official designation. So without that ability to get rid of those billboards, I am not sure what use or benefit it would really give them.

Mr. MINETA. All right, Mr. Packard.

Mr. PACKARD. Mr. Braly, long before I got involved in local government as an elected official, I was asked by the city of Carlsbad to help develop and write the sign ordinance, which is one of the more controversial assignments in any area. And I am very sympathetic to the concept that Senator Davis' has propounded in his statement, and that is that it ought to be left to the local control. What do you see as the federal role in developing appropriate sign usages and sign control as it relates and as it dovetails into local and state control?

Mr. BRALY. Oh, I think we believe very strongly it should be left to the local governments. The problem we have in these areas is that because of federal beautification law, the local governments have no, and the state governments have no authority to do anything within 660 feet of the freeway. And therefore, the Federal Government has taken over that local control and it is just impossible. The national recreational area in the Santa Monica Mountains which is receiving significant federal monies for land acquisition, significant state monies for land acquisition. It is a beautiful area and Agoura Hills is within the heart of that area and there is nothing they can do under existing federal law to deal with these billboards which would become a blight on that national recreational area.

Mr. PACKARD. One of the dilemmas of course is that many of your sign companies have signs up and down the state and even interstate. Conforming and living with a wide variety of local ordinances makes it very difficult for them to manage a statewide or even an interstate or nationwide business. How do business people adapt to that as they move from one jurisdiction to another with local control over the signs? How do they deal with that?

Mr. BRALY. Well Congressman, one way we were trying to do it in Sacramento was by only applying proposed amortization to scenic highway quarters and making those standards very specific. So you are not dealing with every part of the state, every freeway of the state that goes through urban areas for example. When you are in a pristine area that is a scenic area, then you could use amortization. But even in that situation, we can not do that in the Sacramento legislature because of the existing federal law. And that is how we were proposing to limit it so that it would not affect the whole state and every aspect of a billboard company's business.

Mr. PACKARD. You would like the Federal Government to get completely out of the sign business?

Mr. BRALY. Out of the sign business or if you would as a compromise limit it to those areas in California, for example, which have scenic highway designation as of a certain date. That certainly would deal with our specific issues in the 101 quarter, although there are probably some other issues in other quarters in our district.

The point is that in Agoura Hills, because the city of Thousand Oaks and Westlake Village planned communities 20 years ago got rid of their billboards and any signs, they are the last bastion, so

everything is in the city of Agoura Hills. And it is three miles long has 30 billboards. And the people who live there and the people who visit that very beautiful area find it not very pretty.

Mr. PACKARD. Thank you, Mr. Chairman.

Mr. MINETA. Mr. Hastert.

Mr. HASTERT. Thank you, Mr. Chairman. Your problem is basically with the billboard owners or operators, right? Are they basically run on a national basis in your area or are they local?

Mr. BRALY. Primarily the 3-M company, those types of national concerns, yes.

Mr. HASTERT. What about private? What is the difference between a conforming billboard and a nonconforming billboard?

Mr. BRALY. It depends on what the local sign owners——

Mr. HASTERT. Well, in your area?

Mr. BRALY. Basically, what we're looking at and I think the cities, certainly we carry legislation for, are looking at the tall off-site billboards where a landowner has leased some land and he put up a large billboard.

We're not talking about on-site signs where a local business adjacent to the freeway has a sign on his or her business which tells people what that business is. That's not what we're talking about. We're talking about the freestanding billboards which are selling things.

In many cases the ironic situation is that they are selling things outside of the city limits so not only do you have to put up with the unsightliness of the billboard, they are selling their business outside of the city limits and they are not even promoting businesses within your city limits and getting the sales tax revenue from them.

Mr. HASTERT. Well, in your previous oral testimony here you are talking about taking down signs, gasoline signs from local businesses too, is that——

Mr. BRALY. They are not allowed under federal and California law.

Mr. HASTERT. But you're doing that, so who is——

Mr. BRALY. The city of Agoura Hills has passed an amortization on those tall signs, not on-site signs, but the 50 foot pole signs. There will still be on site signs in those areas.

Mr. HASTERT. So you are saying that you think that there is no effect on local businesses as far as directional signage and things like that?

Mr. BRALY. Well, there may be some effect, but not on the billboards. The billboards in Agoura Hills, for example, are promoting businesses outside the city limits almost every one of them. The businesses within the city, the pole signs are coming down. The piece of legislation Senator Davis put in this year was to expand the logo system which we have on I-5 in the San Joaquin Valley, where businesses at those freeway interchanges, the gas stations, the hotels, the McDonalds, would be able to buy logo signs on those freeways. They are not allowed anywhere in this state except I-5 in the San Joaquin Valley.

That bill has been sent for interim study by the state legislature. So we are concerned about local businesses and their ability to be

able to get patrons, and of course the city is too because that is sales tax revenue that goes right into the city's general fund.

Mr. HASTERT. That is immediate? I mean that is the immediate turn off, it is not 10 miles down the road telling you if you want to eat, plan to eat, or things like that?

Mr. BRALY. Well we do have signs in California which indicate generic, you know, food, lodging, next exit, or two exits. So you have those. The logo sign program would be specific. McDonalds, Jack in the Box, Chevron. We have them on Interstate 5 in this state in the San Joaquin Valley, but only in that area. They have not been allowed in other parts of the state and we are looking for a test state program along the 101 freeway to deal with those local businesses.

But again, Congressman, the billboards are not promoting the local businesses, they are freestanding and they are promoting usually businesses outside the city limits.

Mr. HASTERT. Well, one of the things when you start to change federal law, you start to change it for everybody. And, you know, I have a lot of interstates in my district and there are a lot of local businesses that say, you know, my restaurant says 10 miles down the road and you have to turn off at this intersection, and I think we have not had a lot of complaints about those types of things and it fosters a local business free enterprise system, at least as we know it, and so I do have some questions, I appreciate your testimony, thank you.

Mr. BRALY. Thank you, Congressman.

Mr. MINETA. I would like to now call forward a panel made up of Ray Grabinski, member of the City Council here in Long Beach who is also the vice chair of the Los Angeles County Transportation Commission, the Honorable Thomas F. Riley, Supervisor of Orange County and a member of the Orange County Transportation Commission and the Honorable Susan Lacey a member of the Board of Supervisors, Ventura County and the chairperson of Ventura County Transportation Commission.

Mr. ANDERSON. Mr. Chairman.

Mr. MINETA. Yes, Mr. Anderson.

Mr. ANDERSON. Could I just interrupt to give you one of my problems?

Mr. MINETA. Absolutely.

Mr. ANDERSON. Supervisor Tom Riley, Orange County, is one of my problems. And I called him up the other day and I told him, "Tom," see I consider him one of the greatest supervisors in the whole nation, but I told him I could not name him the number 1 in the nation because that would make it difficult for me to go along with my own supervisors, you know, so I would say, if I were to pick the top five supervisors in the county, and that is pretty good, no question about it, Tom Riley would be one of those five, that is almost to the top Tom, but it still keeps me all right with my local guys.

And earlier this year, the Orange County Board of Supervisors voted unanimously to name the new terminal at John Wayne Airport after Supervisor Riley. And as some of you may know, it was Tom Riley who pushed for the airport expansion for 13 years or more before the project got under way in 1987 and the new Riley

terminal contains 337,000 square feet which is 13 times larger than the airport's existing 26,000 square foot terminal. Needless to say this is a great honor for Tom, and his family and I congratulate him on receiving this special recognition and I kind of hope that Tom invites me later in the year to the terminals grand opening. Anyway, congratulations Tom and I am sorry for taking the time, but he is a great guy and when you have a guy so good, once in a while you got to say it about him, in Orange County too, you know.

I will stop there. I could say something nice about the others, Ray Grabinski and so on, but I will stop. Ray is in my district too.

Mr. MINETA. All right, the testimony of all of you will be made a part of the record and so let us just go ahead and start.

Mr. Grabinski, if you would go ahead and start your testimony.

TESTIMONY OF RAY GRABINSKI, VICE CHAIR, LOS ANGELES COUNTY TRANSPORTATION COMMISSION, LONG BEACH, CA; THOMAS F. RILEY, SUPERVISOR, ORANGE COUNTY TRANSPORTATION COMMISSION, SANTA ANA, CA; AND SUSAN LACEY, SUPERVISOR, VENTURA COUNTY TRANSPORTATION COMMISSION, VENTURA, CA

Mr. GRABINSKI. Thank you, Mr. Chairman. I want to find out, is the microphone working back there for everybody. It works, it was a little quiet earlier. Mr. Chairman and Members, it is my honor to represent the L.A. County Transportation Commission as the vice chair and also to welcome you to Long Beach.

Just a very short distance away from here, is a light rail system, probably about 400 feet will open up the 14th of this month and be the first time in 26 years that we have had that kind of transportation in L.A. County and we are very excited about that. I am going to be speaking a little bit about that.

I would like to say first, though, it is a real pleasure to be before gentlemen like yourselves who have been the trailblazers for many of the transportation solutions that have happened in our country and especially our Congressman Glenn Anderson who has always seen the need for transportation long before there were problems and we certainly want to take the opportunity to thank you, Glenn, for all of that.

And Mr. Mineta who has done a great job in the air transportation field, we have been before his committee and we certainly are very respectful of all the good work that he has done. Mr. Packard's comment about the multimodal approach certainly strike a cord with all of us and Mr. Hastert's comments about guaranteeing the future, I think, are something that will lead into the remarks that I am going to make about, I hope, with where we are going with L.A. County.

I would first like to talk about the commitment to mobility. In 1980 the voters in L.A. County adopted a half cent sales tax dedicated to public transportation improvements. They raised over $390 million a year. These funds enabled us to build entirely with local revenues the Blue Line which I just spoke about and which will open on the fourteenth of this month. Seventy-nine percent of the total rail construction funding is from local and state sources. And as Chairman Mineta stated earlier the voters in California again

demonstrated their support for mobility by approving three ballot referenda.

I would like to talk a little bit about the renewed federal commitment, and I hope I have not made you feel like I set you up for this, but the federal share of the transit funding climbed from 47 percent to 29 percent from 1981 to 1987. During that same period the federal share of highway spending declined from 30 percent to 23 percent.

Meanwhile, the Federal Government continues to enact legislation with the best of intentions that puts more financial burdens on the local infrastructure. For example, the clean air legislation which I am sure others will be talking about and the recently enacted American's With Disabilities Act, depend on local transit authorities to meet and help solve many of the social problems without providing additional resources. Consequently, our project calls for spending the entire trust fund and the opposition to a gasoline tax increase for deficit reduction purposes.

I would like to talk a little bit about the local transit projects, which I am sure you heard some about, but I think bear repeating.

Number one, the Red Line which is the backbone of our entire system. Without the Red Line, the vehicle miles traveled in the core area of the business district would increase by 25 percent by the year 2000.

M.O.S. 1 is fully funded. Operational in 1994, and 50 percent federal share of a $1.3 billion cost.

M.O.S. 2—fully funded contract signed in April of this year, committing up to 667 million or 46 percent of the cost, will begin service in 1996 with full operations in 1998.

M.O.S. 3, 6.3 miles of extending the Red Line into the San Fernando Valley, service expected to begin in the year 2001. This is the highest priority of LACTC in the reauthorization bill.

We urgently need the support for legislation directing UMTA to enter a full funding contract for the $688 million federal share of this over $1 billion project.

We also have the Orange Line. This is the future of heavy rail route and it is extending the Red Line west of Wilshire to the east of Union Station. We will soon begin the alternative analysis stage and are working closely with our congressional delegation and affected community groups to assure the most effective route.

We seek authorization of $50 million to match local funds with the final design and preliminary engineering work which will be necessary before the final project approval.

Highway programs, I think this speaks to the multimodal approach, the Combined Road Program, the Block Grant approach testing pooling of federal funding categories is on-going.

Our support for continued authorization is predicated on the continued emphases on local decision making and funding allocations.

Smart Streets is being implemented right now. It utilizes advanced technology to reduce congestion, pollution and travel delays through the improved traffic management and information systems.

The LACTC is currently involved in the Santa Monica freeway demonstration scheduled for 1993. This is very important. This can

reduce travel times by 15 percent with a resulting reduction in fuel use of 13 percent.

More importantly, pollution emissions would be reduced by 10 percent.

We encourage your support of such programs and believe that the Federal Government should continue to be in the forefront of advancing research in this area.

Secure funding for bus operations. We are very concerned about that also. Continuing of section 9 operating assistance necessary to keep smaller operators in business and to minimize economic impact of increased fares for those who most depend on the transit system but can least afford the increases.

We have also encouraged competitive bidding for bus service which has resulted in the complimentary private bus system in the foothill transit zone.

It is our feeling that over the last four or five years, this partnership that has been developed by the federal, state, local and private sector has worked well and will work well in the future and our concern is that the projects that we are talking about and the magnitude that we are talking about are really a four legged stool and we need all four of those legs, the Federal, the State, local and private sector and that is the reason for our feeling of this commitment to the reauthorization.

Thank you very much.

Mr. MINETA. Thank you very much, Mr. Grabinski.

Next, Mr. Riley.

Mr. RILEY. Good morning Mr. Chairman and Members of the committee. My name is Thomas F. Riley. I am a member of the Orange County Board of Supervisors representing the 5th Supervisorial district. I am a member and immediate past Chairman of the Orange County Transportation Commission and this morning I will also be speaking on behalf of the Orange County Transit District.

I would like to deviate from my notes just a minute to acknowledge the wonderful introduction that I received from Congressman Anderson. I am not sure the rest of the day will get off of cloud nine, except that he has been a tremendous person in helping Orange County become the place to live second to none and we were certainly pleased when Congressman Packard was assigned to that committee. We know that Orange County will be well looked after and that is the reason I was excited about being here this morning.

I want to thank you for the opportunity to testify this morning on behalf of the Orange County Transportation agencies regarding the upcoming reauthorization of federal highway and transit programs.

Before I begin, just a few words about Orange County. Once in the shadows of Los Angeles, Orange County has become enormously successful and a powerful economic engine in its own rights. After three decades of explosive growth, it is the home of 2.3 million people. The County has produced 1.2 million jobs and boasts an unemployment rate of less than 3 percent. If its goods and services were a gross national product it would rank as the fortieth largest economy in the world.

38-253 O—91——64

Since much of Orange County's growth has come after the State and Federal Government slackened their freeway building activities, we have had to turn to other options including:

[1] Developer fees that are the highest in the nation, paying for roads well beyond the site of a development, including a fee program that is a catalyst for Orange County's three tollways.

[2] We lead the state in miles of High Occupancy Vehicle lanes (HOV), with more under construction. We are well on our way to completing a 90 mile system of exclusive lanes for car pools and buses.

[3] We recently introduced the first Southern California commuter rail running between Orange County and downtown Los Angeles, and with other counties in the region are experiencing a resurgence in public interest in rail transit. Meanwhile our bus system continues to hit new records for patronage with improved recovery costs from the farebox.

The downside of this success story, however, has been a persistent lack of public financing for needed transportation projects. Despite our efforts traffic congestion continues to worsen for lack of adequate investment. Over the next several months, we will join the benefits of California's recent voter-approval fuel tax while also considering a third try at voter approval of a local transportation sales tax.

With these observations as background, I will summarize our key recommendations on a new national surface transportation program.

First and foremost we encourage you to preserve and protect the federal revenues that have built and supported so much of our transportation system. We view the fuel tax as a "user fee" that should be dedicated to transportation investments. We recommend that you make permanent the Highway Trust Fund and the revenues to support it.

As you know, much of our existing transportation infrastructure is in a state of decline while, at the same time, population and economic growth in areas like Orange County requires new highways and transit investments. Less than a month ago, California voters recognized these realities in approving a State gas tax increase.

However, this type of voter support for funding the transportation infrastructure would not have been possible if the Federal Government were diverting fuel taxes for non-transportation uses. We urge this committee to maintain its strenuous opposition to increasing fuel taxes for purposes of reducing the federal budget deficit.

Equally important to public attitudes and receptivity to new transportation initiatives, is insuring that residents of California, along with the rest of the country, receive a "fair share" return on their fuel tax dollars. I strongly recommend that you preserve the 85 percent minimum allocation for federal highway funds that you first enacted in 1983.

As part of the effort to protect and preserve the federal revenue base, we recommend that you reconsider the current federal policy of exempting alternative fuels from federal "user fees." Currently, the effect of these exemptions on the Highway Trust Fund is minimal. However, as the use of these fuels becomes more prevalent,

and perhaps mandatory, we are concerned that there will be a significant drain on revenues. We believe that now is the time to address this issue and preserve the long-term integrity of the Trust Fund.

Just as important as preserving the Highway Trust Fund, is the urgent need to manage it effectively. Our primary concern is with the current large unspent balance in the Fund. While these monies sit idle in order to cushion the true magnitude of the federal budget deficit, critical surface transportation needs go unfunded. At the same time, public knowledge of the situation seriously undermines our credibility with the voters and with the users of the transportation system.

We urge the committee to support actions which will permit spending down the Highway Trust Fund balance to prudent levels at a reasonable rate. In addition, we urge a gradual lifting of the obligation limits for transportation programs to prevent further buildup in the Trust Fund.

We recommend that a portion of the funds made available by reducing the Trust Fund balance be earmarked for development of programs to encourage and reward local investments in transportation improvements that serve regional and interstate, as well as local travel demands. The State of California has implemented such a program as part of the recent fuel tax increase, setting aside more than 10 percent of the new revenues to match locally generated funds. A similar federal grant program would encourage the development of new intergovernmental and public-private partnerships needed to solve our transportation problems.

To further encourage local and private investments in our transportation infrastructure we urge you to build upon the limited authorization for toll road financing that this committee championed in the last federal reauthorization act. From my perspective as a board member for one of the joint powers agencies in Orange County that is designing and building a toll road under H.R. 2 pilot toll road provision I urge you to make this program permanent. Further, we recommend that you consider eliminating barriers to retrofitting tolls on facilities which have aged beyond their design life and for the integration of private toll facilities with the federal-aid system.

With regards to your reauthorization of specific transportation programs, we strongly support a continued federal role in the rehabilitation and replacement of the federal-aid highway system to protect the enormous investments already made in these facilities To ensure that federal dollars are spent where they will do the most good, we also support consolidation of the numerous categorical programs, with greater state and local flexibility in spending decisions.

In light of many of the requirements now being imposed on local government for congestion management, air quality improvement and mobility for the elderly and the handicapped, we also urge you to continue federal support of transit programs, including the dedication of one penny of federal fuel tax to transit. In addition, we support a greater reliance on formula allocation of funds for transit capital improvements along with greater flexibility in their use.

We are also concerned about the process for handling federal transit grant requests, particularly the trend toward earmarking funds for projects in advance of the filing of grant applications. An attachment to my written testimony describes an interchange project to connect operating segments of our HOV lanes system that we believe will compete well for federal funds based on its cost effectiveness and its local funding support.

While we recognize that this committee does not have jurisdiction to award this grant, we are concerned that all available funding for upcoming years will be lost to us through earmarking. We respectfully request your support in ensuring that all applications may complete for federal grants on a level playing field.

Mr. Chairman and Members of this committee that concludes my remarks. Thank you, once again, for the opportunity to speak on behalf of Orange County.

Mr. MINETA. Thank you very much, Mr. Riley. At this time I would like to submit a statement from our very fine colleague, Congressman Robert Lagomarsino to be entered into the record at this point.

[Statement of Mr. Lagomarsino follows:]

TESTIMONY OF REPRESENTATIVE ROBERT J. LAGOMARSINO

Chairmen Anderson and Mineta, Members of the Committee, I appreciate the opportunity to address the subject of Post-Interstate Surface Transportation Programs as they relate to Re-Authorization of Federal-aid highway programs. I commend the Chairmen and the members for addressing the serious problem of traffic congestion in Southern California with efforts to improve port access and develop intermodal networks and other infra-structure components.

Last month, as you know, the voters of California signaled their support of such programs by approving Propositions 108 and 118, authorizing the issuance of $21.5 billion in bonds for transportation purposes.

Later today, you will hear from representatives of the Ventura County Transportation Commission and agencies in Ventura County supporting the Port Hueneme Access Plan. This plan, developed by the Port Hueneme Transportation Task Force in conjunction with the Southern California Association of Governments, proposes a number of steps to deal with the increasing traffic congestion in the area of the Port, the Naval Construction Battalion Center, located at the port, and the nearby Point Mugu Naval Air Station.

The Port of Hueneme is an important economic and national security asset. The access plan will provide environmental, public safety and national security benefits to the surrounding communities and the nation. I hope that in the development of the surface transportation authorization, you will provide an opportunity for a plan like this one, which has regional and national significance, to receive federal assistance.

Thank you for your consideration.

Mr. MINETA. I would now like to introduce the Honorable Susan Lacey, a member of the Board of Supervisors of Ventura County. Your statement will be made a part of the record so if you would go ahead and proceed in your own fashion please.

Ms. LACEY. Thank you, Mr. Chairman and Members of the subcommittee. I am Ventura County Supervisor Susan Lacey, Chair of the Ventura County Transportation Commission, which represents 10 cities and the County of Ventura. I am testifying today on behalf of the Commission, South Coast Area Transit and the Port of Hueneme.

I would be remiss if I did not mention to you that we have the mayor of Oxnard, Nao Takasugi with us today and also councilman Orvine Carpenter from the City of Port Hueneme.

Thank you for the opportunity to address this committee on the reauthorization of the Federal Surface Transportation program. First, as it relates to the County's public transit operators, and then, the Port of Hueneme.

Transit. The South Coast Area Transit, or SCAT, is the major transit operator in western Ventura County, serving over 300,000 residents. Approximately 32 percent of the annual budget or $5 million is comprised of Federal operating assistance under Section 9 of the Urban Mass Transportation Act.

S.C.A.T.'s. most immediate concern is the continuance of Federal capital and operating assistance under the formula grant program which was established through the Surface Transportation Assistance Act. Initially, when this Federal provision was enacted, SCAT was eligible to receive 50 percent of its operating budget from Federal funds. However, with the enactment of an operating cap in 1978/1979 the agency was prevented from using more than $1.8 million in Federal operating assistance. Since that time, the Gramm-Rudman-Hollings Act has reduced the funds even further to $1.3 million. This has placed a substantial burden on the agency when mass transit is one of the prime alternatives to improve air quality and provide transportation mobility to the handicapped and our senior community.

With the best of intentions, Congress is considering revisions to the Clean Air Act and is reviewing the ADA, the Americans with Disabilities Act. However, there has been no consideration for funding the transportation alternatives that these legislative enactments mandate. It is most disturbing that the Administration's proposed transportation policy has targeted mass transit for further reductions or elimination of funding altogether, despite the needs for suburban and rural mobility.

Although support for transit funding is one of several local policy efforts, it is also one of national significance. We believe that the reauthorization of the Surface Transportation Assistance Act should include funding for both transit operating and capital programs at greater levels.

And now I would like to speak to the Port of Hueneme access improvements. For those of you not familiar with the area, the Port of Hueneme is located about 60 miles north of Los Angeles. It is one of only four commercial ports in Southern California, a region that exceeds many nations in terms of economic impacts. The Port is located in the vicinity of the Naval Construction Battalion Center (home of the Navy's famous Seabees) and the Pacific Missile Test Center.

It is clear the economic impact of the Port of Hueneme extends beyond the local area's boundaries. The Port plays a vital role in the distribution of goods, but also provides substantial economic benefits to the state and to the nation in terms of jobs, personal income, business revenue, and taxes. Port facilities operate as one of the main fronts in resolving the trade imbalance issue. Our nation's ports, like the Port of Hueneme, play a vital role in international trade, economic development, and the national defense. The Port of Hueneme also serves as a facility for handling offshore oil developments in California.

The Port of Hueneme is connected by rail to other areas, but, unfortunately, is the only deep water port between Los Angeles and San Francisco without direct freeway access. Port traffic must travel on urban arterials to connect the docks with the nearest freeway, which is U.S. 101. Port and Navy traffic must also compete with background residential and commercial traffic for space on local roadways. To reduce congestion, noise, and damage to air quality, additional highway capacity is needed. Lack of additional capacity could ultimately constrain the growth of the Port of Hueneme and interfere with important missions of the Naval facilities in the area.

To address these problems, local governments have developed the Port of Hueneme Access Improvement Plan. The Southern California Association of Governments (SCAG) has endorsed this plan and included projects in its SCAG's Regional Mobility Plan. The Port of Hueneme Plan has received endorsement from the county and the cities of Ventura, as well as from the Department of the Navy, the California Department of Transportation, Southern Pacific Railroad, offshore petroleum companies, the Automobile Club of Southern California, and the California Trucking Association.

I would be glad to send the committee specifics about the access projects contained in the Port of Hueneme plan. We have made progress in implementing the Ports Access Plan since Congressman Anderson visited the Port in December of 1988. The three main projects listed in the plan are:

One, Rice Avenue extension and State Route 1 Interchange—this road is a nonexistent "missing link" which must be constructed for the Rice Avenue/Hueneme Road corridor to function as the main access from the south of the Port.

Two, the Hueneme Road improvements. This widening is needed in conjunction with the Rice Avenue extension.

And finally, Victoria Avenue improvements—this work, including reconstruction of the Victoria Avenue and the U.S. 101 interchange, is the third essential link in the Port access improvements.

At present, costs for the port access projects total $84.4 million. Thus far, we have been able to secure $22 million funding for the necessary local work. However, we will need federal assistance to make up the shortfall.

We are enthusiastic about this committee's interest in the importance of intermodal and port access matters and believe it is essential that the reauthorization of the Surface Transportation Assistance Act specifically deal with this issue. We hope appropriate federal resources will be available to assist with implementation of access projects to keep the valuable natural resource of the Port of Hueneme as an economic asset to this county and this country.

Thank you for the opportunity to speak. On the other side of the folder is correspondence supporting my remarks. I would be happy to answer any questions.

Mr. MINETA. Thank you very much, Ms. Lacey.

Chairman Anderson.

Mr. ANDERSON. Supervisor Lacey, many counties in California now overmatch their transit construction projects. That is, they contribute more local funds than is required by law. How do you

believe a federal program should be structured to best support these efforts?

Ms. LACEY. I am going to turn that question over to Mr. Riley and let him answer.

Mr. RILEY. I guess I was watching you and I am not sure I got the whole question, but I think the big thing about it Congressman Anderson is that today the matching of funds are part, I think, of—I am trying to figure out how to say this, but I think the public's interest in what we are doing and how we are doing it, I think, very important. Because I think they view the use of the activity of these funds as something in pretty good trust.

For instance, when we failed on measure M the last time, I had seven people who called me afterwards. Their challenge was primarily that they had voted for highway tax funds which were not being spent by the Federal Government, also, not being spent by the state and why would they anticipate that a further vote would see that the local funds were spent.

Interestingly, even though we had suggested that there be an overview committee appointed by the Orange County grand jury to insist that these funds be spent as directed and if it went over $100,000 they had to go back for election.

Unfortunately, of the seven people, none had read that part of the effort and I did have two people call me back later and said they would now vote for it if we put it in to understand that.

But I think there has just been a lack of trust by the public, unfortunately, in our business which is one of the things—the only thing that I do not like about being an elected official. I do not call myself a politician anymore because that connotation seems to have a lack of trust. But I think that the changes that we made—and I saw recently that somebody wishes in the state to continue the earthquake funds, tax funds that we gave up as part of helping to pay for other state issues.

I think that the important thing that we have to sell to the public today is that what we say and what they vote for is what means what we are going to do with it.

Mr. ANDERSON. As I said in my question, I said many counties in California now overmatch their transit construction. It so happens that it is not quite that simple. Some overmatch it, some do not have enough money. And of course like in your case, Orange County, I often think of Orange County as a relatively wealthy county. And yet, you remember they were one of the counties that was having trouble raising local money to match the federal funds, and that is why you are entering into, if you have not already, the building of some toll places so you can raise some local funds to have more local match?

Now, if Orange County has to do this then some of the other counties that are not as wealthy as Orange County will have to do similar things, and so that is why I was raising the idea. And of course you are aware, this last election the State of California raised its own tax so high and we hope that that will somehow be allocated to help some of these areas match the federal funds. But I kind of wanted to hear what you people in the counties were doing about it because every county is a little different.

I mean, you can take two counties that you think are right next to each other and you will find they are totally different when you get right down to where their money comes from.

Ms. LACEY. Congressman, I can add from the prospective of the county of Ventura, we are going to go to our voters if the Board of Supervisors—I am wearing all my different hats—puts it on the ballot for a half-cent sales tax for November in order to be able to have our local share. Ventura county also does not have—I always get this wrong—interstate, the one where you get more money and so that is also a problem for us. We have no interstate highway.

Mr. ANDERSON. You are aware, I know, that in the last bill we passed we took care of Ventura county fairly well on some of your projects, as well as Orange county too.

Ms. LACEY. That is what I understand, and we appreciate that.

Mr. ANDERSON. And one other thought, because this is also one that bothers many of our people, have you calculated the cost to your county, that would either one of you, of meeting the requirements of the new Clean Air Act amendments. This is a problem we are being asked to constantly—particularly for Los Angeles, but it is going to affect the whole state, particularly the southern part of the state.

Mr. RILEY. We have not, but do know that it is going to be a very substantial. Our staff has been working on that as to how we can encourage this participation, how we, in addition to the actions already taken about staggered work hours as to how maybe we are going to have to pay for parking to encourage those who car pool. Certainly it is another added concern that we do have as.

In our county, Congressman, you know, we are job rich and we attract from from other counties into that economy. So, our own economy has been one, and certainly missing the opportunity that you talked about a moment ago on the toll roads. The enthusiasm for the toll roads, I think, has been generally very well accepted, but on the other hand major M, which has failed in Orange County, and we are one of the 10 large urban counties that this has happened to, and yet perhaps that tax—the other counties surrounding us have passed us.

That is the reason we think that the education process and bringing this up again in November is probably essential to encouraging both a state and Federal Government to be responsive to our needs.

Mr. ANDERSON. You might have answered my next question, it is going to be directed to you, Supervisor. Supervisor Riley, how would you respond to a taxpayer who asked you to justify the retrofitting of highways as the toll facilities which you will be putting in—because you know those are going into developing sections where you have to put in a relatively major and I assume an interstate highway—but the local match of Orange County is going to come from the toll facility you are going to be putting in there? If a taxpayer in Orange County asks you to justify this, how are you going to do it?

Mr. RILEY. I try to do it almost every day, sir.

Mr. ANDERSON. I see.

Mr. RILEY. And every place I go out people ask me that question and I go back again pointing out, you know, that we do have 29

cities now in Orange County and each of those zealously guard their jurisdiction in relationship to development in land use.

The city of Irvine, for instance, where the spectrum area is and I know you know that area, we have three jobs for every person who lives in the city. So that means that we are attracting a tremendous number of people from out of county to those jobs.

I try to point out to them that you know, everybody wants to be a part of Orange County or live in Orange County. I talk about it being the place to live second to none. And point out again that our own economy has done us in. This great economic boom that we have has caused problems of bringing people in. Land values are tremendous as you well know. To try to get there and to try to provide for housing. We were unable to try to provide transportation to meet these needs because I think of the various government jurisdictions of having their interest. Until we were able, through your efforts, to come up with the toll road, which as you well know we are asking the land owners to pay a 48.6 percent fee on their land and the housing and the developments that have occurred. And hopefully with the toll roads we will be able to provide adequate funding with some state help in that regard. I cannot tell you why Orange County has—but they really do not vote for very many issues on the ballot.

Mr. ANDERSON. Both Los Angeles and Orange County have significant port facilities which have special significance to your local economies as well as to the national economy. Now specifically, how should these facilities be treated under our new surface transportation bills? I address that to you because I said Orange County. I did not mention Ventura, I could have said—so either one of you, whichever can—they are very similar.

Ms. LACEY. Very quickly, I think our initial reaction is that helping us with the access is obviously what we need for the Port of Hueneme. And then I will let the gentleman down here elaborate as far as Long Beach.

Mr. MINETA. Mr. Grabinski.

Mr. GABINSKI. Our multimodal approach, I think, lends itself well to this whole problem of access. We do have the two busiest ports in the United States right here in the Los Angeles-Long Beach area. And I know Mayor Bradley will probably speak to that also, but the access throughout the county is tremendously important and that needs to be looked at very carefully by the Federal Government because we all benefit from what flows through the ports in both directions.

Unfortunately, as the young lady from Ventura is pointing out, access to ports has always been difficult. Just by the geographic nature of ports—getting in and out of those areas and having the incredible capacity that goes through them almost always forms an hourglass, if you will, of trying to get the transportation in and out. And as you well know, we are working on the Alameda corridor issue and I think my colleague Councilman Kellogg will be speaking to that later. This partnership that we talked about earlier has probably never been more critical than right now.

The ports are going to be doing booming business in the future and if we do not solve the transportation issues here in the county

the negative impact can be awesome. I think the Federal and the state Government and obviously the local governments too.

I think that is one of the reasons that the county of Los Angeles came to the realization a little earlier than some others that we were going to have to participate through Prop A and other things was because we saw the immediate need of the traffic congestion not just being a problem for commuters going back and forth but also being a terrible problem for the economy of the whole county.

And I think that is one of the reasons we may have a little bit of a leg up on some of these other areas because we were hurt earlier and probably more severely by the economic impact of the traffic congestion so you cannot do enough.

Mr. ANDERSON. Sometimes even doing something causes problems. You remember before we had the Harbor freeway one of the big concerns—both the parts of L.A. and Long Beach were not doing very well. One of the problems was getting the trucks and so on to downtown so they could be shipped out and so on. And once we put in the freeway, then within just a few—I would like to say months, but within a very short period of time, it became the most highly congested section of interstate in the nation. It was not there until we made it so that everybody could get on it and everybody did.

And so now we have a problem with a highway that—what particularly was congested, sometimes it takes two and one half hours for a truck to get from the ports to L.A. and then they pay them the same hours—by the hour—the cost is so high that they cannot—and then they have to raise the price of the commodity that they are selling and it makes it so we can not compete. So sometimes doing something helps create more congestion, then it causes a problem. So when we build highways, then you have got to think, oh, now we have got to build a transit to keep people off the highways. When we build the transit you have got to do something else. It is just a constant effort, and of course from you people we have to be told what you want us to do next.

I am sorry I am asking too many questions so, thank you.

Mr. GRABINSKI. Mr. Chairman if I could say one more thing about that port problem. The L.A. County transportation commission took $50 million of Prop A funds to change some of the freight lines just so we could move towards making the Alameda corridor a reality so that we can move this freight and as you point out by the time we get this done we will be in pretty much the same situation as the Harbor freeway, getting it done just in the nick of time and probably that corridor will be filled up just like the Harbor freeway.

Mr. ANDERSON. Congested.

Mr. MINETA. Thank you very much. Have any of the panel members had a chance to see the recently published report by Caltrans as it relates to their views on the reauthorization of the highway and mass transit programs? I think it might be interesting for local and county governments to take a look at that.

Mr. GRABINSKI. There is some disagreement, I think.

Mr. MINETA. I would imagine that there would be and I frankly would like to have you take a look at that and get your written comments and reactions to that as well.

Now, in each case, your testimony focuses extensively on mass transit improvements as well as on highway improvements in your counties. What factors are most responsible for this emphasis on your part about the increased use of mass transit resources.

Who would like to start?

Mr. GRABINSKI. Well, since it is here I will go ahead and start. I think in our particular case, the air quality issue and the changing federal statues on air quality and the population growth in L.A. County, I heard the comment made about where one county would sit if it were a country. I think we would be the eighth largest producing country in the world if L.A. county were just a country by itself. I think our concerns and our reason for not just the rail transit but for the multimodal approach is because of the diversity that we face and some of the challenges that we face. The air quality one, I think, being one of the major issues, but the economic impact of those laws is having a devastating effect with business and I am sure Mr. Remy from the Chamber of Commerce will come down here and explain those.

We are very concerned that the people from Los Angeles have been wedded to their car for far too long and what we want to do with your help is to get people out of their little gas boxes and onto another form of transportation and change the mind set in this county so that they take advantage of other opportunities that are clean and efficient.

Mr. MINETA. Who do you think is going to do that? When you talk about changing the habits of people that is very, very difficult. Surveys seem to indicate that people are willing to spend 50 more percent in terms of cost and 30 percent in terms of time if it is safe, reliable and convenient to get out of their car and into mass transit. So if they are paying a dollar a day to commute, they are willing to go to a dollar and one half if it is again safe reliable and——

Mr. GRABINSKI. I guess my best example, and I have the same problem that Mr. Riley does explaining some of these things to the general populous, is that I envision people who are driving down the Long Beach freeway, which is adjacent to our Blue Line, and the San Diego freeway which crosses it. When they are stopped at 7:30 in the morning and at 4:00 o'clock and 5:00 o'clock and 6:00 o'clock in the afternoon in there anywhere from $10,000 to $40,000 cars that are geared to go 200 miles an hour and they are going along at 11 miles an hour, I would suggest that our Blue Line will look like a bullet train to them flying past them. We experienced that just recently when we christened the cars. There was a jam-up on the Long Beach freeway and we were just taking off out of the yard in the Blue Line cars and the people were kind of waving to us with a very sad look on their face.

I think the opportunity has not been there in Los Angeles County since the Red Car in 1961 closed up. And I think the alternative then was the automobile. We had plenty of freeways, freeways were just going everywhere and that was the new form of transportation. I think what is happening now is, everybody has a whole different view. And as I pointed out before, I think the health aspect has a great deal to do with that.

When we open up this line on the 14th, what it is also going to do is, it is going to allow somewhere near 35,000 people a day not

to be in those little gas boxes and be driving in air conditioned comfort to and from Los Angeles and downtown Long Beach in a fashion that is not going to pollute. And I think that is having a dramatic impact on people and I do not think Prop A would have passed nor do I think we would have the support for this opening. We are expecting 200,000 people for this opening. I do not think anything of that would have happened had not the mind set changed in this county a little bit and I would liken it to smoking.

Twenty-five years ago, everybody smoked. People would be smoking in this chamber now. But our habits have changed and they changed dramatically to the point where now if you smoke you are, you know, you are a little suspect. You have to go find a place to smoke, and I think that is the way it is going to be with the cars. I think what is going to happen in the future is, as this multimodal approach takes place, we may have to be more punitive with people.

If you are going to be on the freeways, you are going to be on the freeways going a longer distance. You are not going to go to two off ramps to go to a little store and go back. I know that may sound like a threat to folks, but that is the kind of attitude adjustment we have to take in this county to keep up with the laws that are being passed by the Federal Government and rightfully so because of the health problems that we have had here.

Mr. MINETA. Ms. Lacey, in your testimony you also put an emphasis on mass transit with the experience you had with SCAT, do you find that ridership is, as you say, is increasing and this is an alternative that folks are looking at in Ventura County?

Ms. LACEY. Definitely, we have had a 12 percent increase in ridership just this past year and that is before we have actually gone out and done the marketing that we need to do and that we will be doing in conjunction with the Clean Air Act, and I think when we tie all these together that it makes a lot of sense.

The fear we have at SCAT is that at the time that we are about to really start to change some habits and make it a better alternative for folks and have them recognize that alternative, is that we could see some of our funds going away. And that would be so counter-productive—and we have an equally bad air problem there, we have got congestion, and I speak in terms of mental health. I am worried about mental health. I think we can do a lot for people and for families if we get them out of their cars into the buses relaxing and not fighting—and getting home and the first thing they do is they go in and, you know, step on the cat's tail and shake their children. I would like to see them ease on home on our beautiful clean buses. Go in the door and smile at everybody.

Mr. MINETA. Mr. Riley, do you have any other comments that you would like to add?

Mr. RILEY. I would just like to add to what the two speakers have already talked about, the mass transit and the HOV lanes, which require two riders. We had great opposition initially to that but I guess as we get more and more clogged on the freeways or the highways and the service streets also, more people are doing that.

At one time we talked about mass transit in my district, I call it the fabulous fifth down in the south part of the county. There was a feeling that the use of transit was an indication of people who

may not be desirable to live in the community. Also brought in great densities. I have seen that shift in the past couple of years. That has become a way that people are accepting and people are moving on in that and I think we have watched industry itself convert on the HOV lanes which has been really, I think, noteworthy as a matter of fact in the accomplishments in the South County.

Mr. MINETA. May I ask Supervisor Lacey, on your plan for the Port of Hueneme, are any of these projects included in the State Transportation Improvement Program?

Ms. LACEY. No.

Mr. MINETA. Mr. Packard.

Mr. PACKARD. I think we have interrogated this panel quite thoroughly.

Supervisor Lacey, you reported in your testimony that there are no freeways in your district or in——

Ms. LACEY. That is correct.

Mr. PACKARD. What are the impacts of the port itself and the activity of the port on your local streets?

Ms. LACEY. Well I think my testimony referred to the local streets as urban arterials. I am sure that is a good word in the jargon. But what I would call them are city streets and in some cases as it crosses my district we have highways that were built for many large farms and so these little roads, they are not highways, they are roads, and they have no shoulders to them, you cannot ride a bicycle, children should not be walking on them, but they do, and it is a very serious impact. And they have major truck traffic along there.

Mr. PACKARD. And the solution?

Ms. LACEY. The solution is a proper access plan. I think the three projects which I presented here would really make a difference—would make a difference to these people's lives that live along there too. Because they are going right through neighborhoods.

Mr. PACKARD. I drove up from North San Diego County this morning and was quite educated on your HOV lanes in the south part of Orange County, Mr. Riley, and frankly there was virtually no congestion this morning. Now, that may have been an anomaly and I cannot credit the new HOV lanes as the reason because there was not very much traffic on HOV lanes either. In fact, very, very, few cars. What can we do to encourage and what is being done in your county to encourage the use of the newly opened HOV lanes?

Mr. RILEY. Congressman, in addition to the HOV lanes, as you well know, is a 405 and 5, there has been considerable work done recently and some additional lanes have been opened, and as you drive down you feel you are still waiting for that horrible traffic congestion that we have experienced, but it has been amazing how just a few additional things have opened things up.

Mr. PACKARD. That is a daily change, it was not just this morning——

Mr. RILEY. Yes——

Mr. PACKARD [continuing]. Because we never slowed down once all the way to Long Beach.

Mr. RILEY. But I think that we are using all of the normal type of activities that are available to us, you know, as I say industry itself, certainly the Chambers of Commerce and other people to try

to encourage—and I think parking as we come down with the—or resource things—as we come along is going to do more to encourage people to use the lanes. Some of the industry in our area is actually rewarding people with money if they use and car pool and so forth on there.

Mr. PACKARD. The transportation commissions in the two counties, particularly that I—Los Angeles and Orange County, are they addressing a balanced approach to your transportation problems in terms of mass transit, new lanes, HOV, park and ride? What is being done, perhaps maybe in Los Angeles county maybe in that area?

Mr. GRABINSKI. Well, we are working very closely with all of the adjoining counties, in particular with Orange County because of the job rich nature of both counties really. We have commuter rail service that we just opened up to Norwalk, as was pointed out earlier, and that is a very significant difference for some of the problems that we have had.

The people who were traveling long distances will now have the opportunity not just to travel on that one but there are several other ones in the works and we are also negotiating with the railroads for about four new lines, four or five new commuter lines, which will take the long term traveller off the road. The one that is traveling an hour or an hour and a half, if you can believe that, back and forth to work. We will be taking them out of their cars and putting them on commuter rail, and that is the short term. That is a possibility that you can see within the next two to four years and that approach, that partnership approach, ends up helping all the counties.

We have put an HOV lane on the 405 to match the one that they have had there. Unfortunately, when you came in you probably started running into traffic when you got to Long Beach, and it just gets worse. I mean as you continue on you would have probably got to—not to the Harbor freeway, before you would have stopped. And that is an everyday situation.

And that is what I was talking about, that the people sitting on that freeway would be seeing the Blue Line go underneath every six minutes. That is hard to believe, but they might be able to see a couple of those trains, in a serious circumstance, maybe three of them go by. But that partnership between the two counties is very important to us and it is also important to us if there is any way that we can help to work with the Orange county folks to educate them about the issue of paying more taxes for transportation. We need to do that.

Because we cannot work these partnerships out with them not having funding and obviously the Federal Government is looking for those areas where they can maximize the tax dollars from the Federal Government. So anything that we can do to work these problems out together we are working out right now.

Mr. PACKARD. There is some serious political resistance on our committee and I think from the Federal Government generally to permit federal aid highways, highways that have been built by or certainly with significant participation from federal dollars to be used and converted over to toll roads or user fee type of arrangement.

Do you have any suggestions on how that can be done that would alleviate the political concerns that we have from different geographic parts of the country?

Mr. GRABINSKI. I will let my colleague speak first.

Mr. RILEY. Well, Congressman, as you indicated, we are advocating very strongly in Orange county that we feel that there should be a congressional change in this and to remove that restriction and to allow toll roads or whatever else we can use to expand what we already have, which obviously is more efficient and costs less to move that along.

Mr. PACKARD. You understand our problem is in other states where—like Pennsylvania and New York—they have built toll roads with their own local funds and not used federal aid highways as toll systems. And then for their tax dollars which help build our federal aid highways in California to be then joined with revenue generating mechanisms there are some real political problems we struggle with on the committee and frankly, some of the leadership Members of the committee have significant objections to us moving in that direction so we in California who are just now emerging into the toll concept, are running into some serious problems and I am not sure we are going to bring about the changes that you have recommended simply because of the political resistance that we feel right within our committee.

Mr. RILEY. We ran into those kind of things like you bring a road up and it patches into a federal road and all of a sudden when you talk about trucks that has been talked about this morning—we have some people that want to keep trucks off, you find out that these regulations do require some skills that, you know, have to develop. There is just no doubt about it, that the—and I am sure it is everyplace, but certainly in California—the attractiveness of bringing people here, the number of people who have cars. In my block, I think, all 16 or 17 year olds whatever, as soon as you get that—gets a car.

Mr. GRABINSKI. It is part of your birthright.

Mr. RILEY. It is part of your birthright.

Mr. MINETA. Mr. Hastert.

Mr. HASTERT. Thank you Mr. Chairman. A couple of things, and I will be brief, that I just heard both Mr. Grabinski say and Ms. Lacey say that we in the Federal Government keep passing laws and mandates and letting local governments pick up the cost. One thing I was interested in and quite a little bit puzzled about, you said the ADA Bill dumped costs on local governments. It is my understanding that you have been doing these things for 10 years and there was not any additional costs. How does that affect you?

Mr. GRABINSKI. Well, I think we probably have as stringent a laws, as you are pointing out, as there are anywhere and we built our rail system with that in mind too. But, I think the point that was trying to be made—and we certainly were not making it sound like things were being dumped on us. I hope I did not make it sound like that.

I think what we are talking about is all things being equal, with an equal amount of funding, it is easier for local governments to participate in these partnerships. But with the new laws coming about—and I guess the point I would like to make is that Los An-

geles county finds itself in the unique position of having the worst air problem to face of anybody, and so the cumulative affect of all of these new regulations coming on board, that are all entirely necessary, are having its economic effect on our ability to move forward in some of these areas. And I guess that the reason for bringing this up is more to enlighten anybody else who is outside of L.A.

We have been working on the smog problem for 41 years, and while we are pretty damn good at it, we still got it. And things are better, but Tom Bradley and I cannot take you outside and show you that they are better because it does not look that much better. And, you know, the issue of the disabled people, we are very concerned about that and always have been here in California. But all of those new regulations, anything that is at all something we did not have before costs more money and those shortages while they may seem small across the board tend to mount up on us.

And, you know, I am sitting here with the blood of our budget still fresh on our hands from having sat there for three days trying to cut things away. So I understand those kinds of situations but I think our point was, we know why they are being enacted and we appreciate the reason for them. We are just having trouble dealing with them and that is our point and certainly not to make it sound like the Federal Government is dumping these things on us because——

Mr. HASTERT. Well, I did not use the term "dumping" but it does compound, I guess we can use that term. But, as a matter of fact, one of our concerns nationally is a lot of leadership on the Clean Air Bill came out of your county, or your area if not your county, and all of a sudden we have national standards that bend the needs of Los Angeles and it is a concern to everybody.

Mr. GRABINSKI. Once again, I think the physical characteristics of our county just put us in a unique position, and I know you hear that all the time about being unique, but the physical characteristics of this county allow the pollution that is generated to stay here. In other places you can manage that. In this county it is very difficult and that is probably the biggest reason we are concerned about making our commitment at the local level and the state level and have it be matched by the Federal Government on some of these projects, these rail projects two, three, five years from now. Because we are going to go to the private sector and hammer the private sector for partnerships. But we have to have the commitment from the fourth leg of that stool which is the most solid, which is the one that we have depended on in the past, the Federal Government.

And along with that what we are sharing is that these other regulations are causing us even further problems, and I am only saying that as one local official. I have only been here for four years and ever since I have been here we have had budget problems——

Mr. HASTERT. I wouldn't have asked you the question if I did not want you to say it.

Ms. Lacey?

Ms. LACEY. Well, clearly when you get into the Clean Air Act if you are going to follow all of the outlined ideas in there it sounds great, but if, in fact, there are not moneys flowing to fill in the

spaces then all you have are words. You cannot develop at a local level—we do not have the resources to develop what will be necessary to really provide the relief. And when you are looking at the Clean Air Act on one hand and you are looking at the reauthorization of the Surface Transportation Act, they do not fit together very well at the local level.

We need funds to flow either in the Surface Transportation Act or we need funds to flow in the Clean Air Act in order to be able to fulfill what the Clean Air Act asks.

Mr. HASTERT. Mr. Riley, I appreciate your questioning of the trust funds and I think most people, at least in this committee and probably unanimously, believe that trust funds ought to flow for the users fees that they were assessed for and that is one of our frustrations sometimes in the Congress too.

I want to move to one other issue before I relinquish my time here and that is the intermodal side of it. You are in a unique situation. You have the wedding together of the ports, sea-going freight, rail freight, truck and traffic freight and a unique opportunity to put together and really utilize intermodal transportation. How do you see the Federal Government? Is that something the trust fund should address or should that be done on a private side or how do you see that being done? Anybody can answer that.

Mr. RILEY. I lean toward the private side.

Mr. GRABINSKI. Could you give me that just one more time?

Mr. HASTERT. In the whole interim issue, and then of course here in the Long Beach area it is certainly very, very important. Should that be addressed by the highway act, these facilities, intermodal facilities, or should that be something that the private sector address and what are your view points on that?

Mr. GRABINSKI. Well, it is certainly something that is very important to the Federal Government because of the port. The creative ideas that will flow from the unique problems of the county of Los Angeles I think will generate the kinds of solutions that will be multimodal. We are going to—I would be willing to bet you that in less than 24 months you will see people doing things in this county they had never planned to do before. When we open on the 14th it is going to open the eyes to a lot of people about the different opportunities of multimodal. Your question gets to the heart of whether or not the Federal Government should be——

Mr. HASTERT. I think we are maybe talking about apples and oranges. I am talking about intermodal as far as freight and handling those types of things. Using huge amounts of traffic, so using both rail and truck and shipping, those facilities that are needed to do that and implement that and I know you have done some of that here already——

Mr. GRABINSKI. And there is more in the works. As a matter of fact there is a study going on right now of a monorail system that might go along side of the river that might haul the containers that we are bringing in at the port and bring them up to the rail yard in Los Angeles. That is one opportunity.

There is also a $100,000 study being done by our commission to determine whether or not there might be the possibility of doing something once again along side of our river bed, which may have to be restructured to hold more capacity. And if it has to be done,

perhaps a heavy rail system along side of the river bed to haul that up there and take a lot of these trucks off the road would be one way.

The Alameda corridor which is a tremendous partnership of both ports, both counties, and all the cities along the corridor is another one of those approaches that you are talking about and we are very hopeful that all of those are going to work.

And part of the goals of the commission are to make sure that we have enough people working in all of those different directions so that we are not getting that bean shooter focus on just one particular area, because the county has an enormous amount of challenges ahead of this.

And I think our goal really ought to be managing success. Because I think, after the 14th, just opening that one line is going to light the candle in this county in terms of the transportation darkness we have been in.

Mr. HASTERT. Thank you, Mr. Chairman.

Mr. MINETA. Let me thank the panel very, very much for their tremendous contribution because of their experience of a far ranging nature: from a rural county that is growing by lot versus L.A. county and Orange county that not as densely populated but with tremendous transportation problems.

I would like to thank you very, very much for being with us today.

I would now like to call on the Honorable Tom Bradley, Mayor of the City of Los Angeles to come forward. Tom, we have your testimony and it will be made a part of the record.

Mr. BRADLEY. So you are asking me to cut my remarks? [Laughter.]

Mr. MINETA. Proceed in your own fashion.

I have got to say, Mr. Chairman, that the Mayor was president of the National League of Cities when I had the privilege of serving on the board of directors of the National League of Cities at the time. But he also at that point gave me the task of chairing a committee to resolve the financial problems between the U.S. Conference of Mayors and the National League of Cities. I have never forgiven him for that. Now is my chance, I guess, to get even.

But in any event, Tom, it is always good to have you before us and you have been a tremendous leader and now if you will just go ahead and proceed in your own fashion.

TESTIMONY OF HON. THOMAS BRADLEY, MAYOR OF THE CITY OF LOS ANGELES, CA

Mr. BRADLEY. Mr. Chairman, thank you very much.

Thank you for reminding me of the assignment that I gave you and I do not know if I publicly thanked you, but let me do it now. I thank you for the leadership which you gave because you did resolve those financial difficulties between those two great agencies.

I am particularly pleased to have this committee meeting here in our community and it is very nice to be able to look into your faces and see that there are three of you who have had local government experience. From California all grew up, came up through the

ranks of local government as mayors and certainly know best what we face in the local communities all over this nation.

I am pleased that the Chairman of the House Public Works Committee is able to be here. I tried to reach you, I tried to wait for you in your hearings last week and unfortunately had to leave to catch a plane before——

Mr. ANDERSON. I tried to catch you.

Mr. BRADLEY. Chairman Mineta and I have worked together here in California for a long time and shared many experiences both in the California cities and nationally. I am pleased that you have continued to give leadership in the Congress to the issues that concern us with regard to surface transportation.

The remarks which I submitted for the record are going to be cut substantially because I really want to get to the heart of why we are here this morning and that record will be available to you for any details that you wish to refer to.

We are all faced with the challenge of traffic congestion, air pollution, and the population growth which this area of the country is experiencing and will continue to experience. And so it is essential that we deal with the issue of surface transportation and find some means by which we can anticipate the growth in the future and help to solve those problems.

We do believe that there is still critical need for a strong federal support financially and otherwise in their role of transportation. We have seen an erosion of that support over the last few years and what at one time was a $4.6 billion program in 1981 is now down to about $3 billion. That is headed in the wrong direction, so we are hoping that you are going to be able to show us a turn in the road and help to increase that commitment to local communities that are trying to develop rail systems.

We who have started the metro rail project still have a great need for federal commitment and it is critical to the expansion of this transit capacity which is needed to relieve congestion on our streets and highways. It remains absolutely imperative that the post interstate surface transportation programs explicitly authorize funds for the completion of Metro Red Line to the San Fernando Valley as well as for the beginning of the Orange Line, as we described it, that runs from East Los Angeles to Westwood.

Because of your existing legislative guidelines for transit projects the Metro Red Line stands out as the most promising new start rail project nationwide. And as a model of strong local and private sector participation. There was a time when there was an 80 percent federal support for rapid transit. By the time we got up to the table, that had been reduced and we were quite pleased to offer an additional share so that we now are able to provide 60 percent of the construction of the first 4.4 mile segment, which extends from Union Station to MacArthur Park.

The full funding agreement was signed in a ceremony with the U.S. Department of Transportation just this past April 10th. That of course will cover the next 6.7 miles referred to as MOS-2.

This extension proceeds northwest to a station at Wilshire and Vermont where the alignment branches north and west. The northern branch proceeds to an interim terminus at Hollywood and

Vine while the western leg goes to an interim terminus at Wilshire and Western.

Provisions in H.R. 2 which allowed for the full-funding contract for MOS-2 were essential to our efforts to secure the $667 million federal share. Likewise, we estimate that the federal share of MOS-3, the 6.3 mile segment from Hollywood and Vine to North Hollywood terminating at Lankershim and Chandler, will be $668 million, and we look to your leadership to include specific authorization and contract authority for this funding in the reauthorization bill.

This month, LACTC, L.A. County Transportation Commission, submitted the documents for planning the route of the Orange Line which will serve an identified corridor east of Union Station and west of the Wilshire/Western alignment.

During the next two years, we will be studying potential routes for the Orange Line and conducting community hearings and other efforts to elicit public participation in selecting the final alignment.

We expect that the Orange Line will extend up to eight miles in both an east and westerly direction. This would enable us to connect Whittier and Arizona boulevards in East Los Angeles to the Century City and Westwood area in West Los Angeles.

Although construction on the Orange Line will not begin until 1996, it is our hope that this reauthorization bill will earmark $50 million for preliminary engineering and final design of this new phase of Metro Rail.

We are very enthusiastic about the prospects for the Orange Line and appreciate the support of this committee in assuring the progress continues for its planning and design.

In closing, I commend the Chairman of both the full Public Works Committee and the Surface Transportation Subcommittee for holding these hearings here in this area. You have already heard some excellent testimony of the needs in both Ventura and Orange county, in addition to Los Angeles county.

I think you will find that in this region of the country we are strongly committed to the idea that we must and we will do our share of contributing toward the solution of the problems of traffic congestion, air pollution and other problems that will have major impact on the economy of this community and indeed the country. So we thank you for giving us an opportunity to offer our testimony and to say to you, we have appreciated your support in the past. And in all candor I would say if it had not been for the Congress, all of us would have been dead in our tracks, because we were not getting support from the Administration and we always had to turn to the Congress to bail us out. We thank you for that. We thank you for what I know are your continuing efforts and cooperation.

Mr. MINETA. Thank you very much, Mr. Mayor. Mr. Chairman?

Mr. ANDERSON. Thank you Mr. Chairman. Tom a significant portion of the metro rail system is in the city of Los Angeles. Would you describe for us the cities local commitment to the project?

Mr. BRADLEY. Mr. Chairman, the Proposition A funds have made it possible for the City of Los Angeles to make major contributions both to metro rail and to light rail. About 75 percent of funding for all of the rapid transit, light and heavy rail, comes from local com-

mitment of the Proposition A funds. We are proud of that. The City of Los Angeles not only has continued to produce the funds necessary, we are going to continue our share. The City of Los Angeles offers $309 million to this program and that is about 8 percent of the total effort.

Mr. ANDERSON. Would you support a restructuring of the federal highway and transit programs which specifically target metropolitan areas with regard to highway and transit decision making?

Mr. BRADLEY. I am not sure I understand your question.

Mr. ANDERSON. Obviously, when we get into working with you the projects become more complicated as you go under and over, like we are doing here in Los Angeles.

And of course in order to work with that we have to restructure our federal highway and transit programs which work in with those and I guess that is what we want to do is to get you people locally, throughout the country really, to support what we are trying to do. Because Los Angeles was one of the tough ones but there are many others throughout the country that have similar problems.

Mr. BRADLEY. I fully understand.

Mr. ANDERSON. You know, we went over the question of where we were going to go through Hollywood, do you remember? We had to pick different streets, then we finally had to go under the hills to get out to north—to get that far into Los Angeles. It became very complicated to do that in national fixed legislation.

Mr. BRADLEY. You remember one of our biggest battles with regard to metro rail dealt with whether or not we could go right out Wilshire boulevard. The route that we thought was the very best and many of our people supported that it was a safe engineering thing. But when the Congressman from that area, Mr. Waxman, intervened and said no, it was unsafe to go through there because of the pockets of explosive methane gas, we finally had to accept a different route. It may not have been the best route, but we were willing to work with the will of the Congress.

Mr. ANDERSON. It looks pretty good now. It does.

Mr. BRADLEY. We fully understand that, thank you.

Mr. MINETA. Tom, let me ask about transportation planning versus what is going to be coming down as a result of the Clean Air Act. Have you or—let me first maybe back up. Who does the City of Los Angeles look to as the ultimate authority in terms of transportation planning?

Mr. BRADLEY. You know there are so many agencies that are involved. The L.A. County Transportation Commission has had a major role. The city also has had input and the——

Mr. MINETA. If you decide to widen the road, can you do that on your own or does that have to be cleared through the——

Mr. BRADLEY. It depends on which road. Caltrans may have a role in it. The city may have a role. The L.A. County Transportation Commission. So it is rather complex then. Now, with Chairman Anderson's comment about the Federal Government desiring and needing to have a voice in some of those decisions I think it is going to require a major bit of cooperation on the part of all of us.

Mr. MINETA. If we are going to try to build in some kind of flexibility into the program so that there is cooperation at the local,

state and federal level and the ability to change or move funds, let us say highway funds, over to transit. Is that machinery a very cumbersome one? Where do you think we might be able to help in trying to improve flexibility, but at the same time not increase the amount of paperwork or kind of hoops you have to go through in order to finally end up with a given project at some point?

Mr. BRADLEY. We just got through the state legislature a bill that will permit us to appoint the same representatives on both the rapid transit district and the L.A. County Transportation Commission, because there were some problems and there were differences of opinion and that created some problems for us. I think that spirit, both those agencies and the locally elected officials supporting that bill in Sacramento is a clear indication. We reached a time when we know that we are going to have to work together in a more effective and efficient fashion.

One of our major initiatives to reduce air pollution was to take the heavy duty trucks off the streets of Los Angeles and obviously off the freeways to a great extent during peak travel hours in the morning, 6:00 to 9:00 and in the afternoon 4:00 to 7:00 p.m. We were able to finally get that measure passed through the City Council but the state legislature, acting at the urging of the California trucking association, denied us the right to impose the fee in order to make that program work and so we had to turn to the air quality district to collect the fees in order to help us all achieve a reduction of air pollution.

I am pleased to say that it was just about a week ago that Norton Younglove, Jim Lynch, and Martin Braude and I in a conference telephone call—I think we moved a long way toward resolving that issue. It could have been very destructive of our whole effort. So that I think is another indication that the agencies responsible for air pollution, for traffic, for congestion relief and that kind of thing, are in concert and we are working very closely together.

Mr. MINETA. Are there other instances that you can point to where your own local priorities have been changed by Caltrans or other regional agencies? Where your own local priorities—I am trying to think back—I know things have improved since I was Mayor of San Jose, where we would come up with a list of priorities and say, "okay this is what we are going to use—to do to spend local money—state, we would like to have you do these things with your state monies." And the state would, and those were days when the highway commission would say, "Well, if you want us to spend state monies on these projects we would like to have you take project A and put it in your—and use city money to do that." And I would say that is not on our priority list. And they would say well if that is the case then we are not going to fund these projects here with state monies. And we were always over the barrel. I do not know if that has improved since then?

Mr. BRADLEY. I think it has improved.

Mr. ANDERSON. You have heard that before too, have you not, Tom?

Mr. BRADLEY. Yes, and I think there has been a considerable improvement in attitude and in the spirit of cooperation. I think that again we have turned to the federal agencies and the Congress to

help us along the way. I would say a very much improved attitude working together with Caltrans local jurisdictions.

Mr. PACKARD. Nice to see you again, Mr. Bradley.

Just two quick questions. The Chairman, Mr. Mineta, referred to one briefly but I did not get a clear understanding as to what the City of Los Angeles is doing. In the Clean Air Act, Los Angeles was actually earmarked for special consideration and special requirements. Has your city analyzed—and we are not through with the Clean Air Act, as you know, we are going to go to conference I think, Mr. Anderson, Mr. Mineta and I are all going to be serving on that conference committee to work out the final product. Has the City of Los Angeles analyzed the impacts of that legislation or that proposed legislation on your city and particularly as it relates to your transportation planning?

Mr. BRADLEY. Beyond the transportation planning we have looked at that and we have also looked at what the Clean Air Act might do with regard to the general economy of this area. We have worked with the Chamber of Commerce and where they have pointed out a certain drastic impact, we have tried to express that to the Members of the committee. I think that we are fully supportive, we are fully understanding——

Mr. PACKARD. Very good.

The other thing, in your written testimony, I think time constraints may have precluded you from addressing it, but you referred to your smart corridors. I am interested in smart highways, smart vehicles and their role in the future of solving some of our problems. Would you tell us briefly what you are doing in your "smart" corridors?

Mr. BRADLEY. We believe that in order to avoid unnecessary impact on local neighborhoods that if we use our resources and use our abilities better to move traffic along major arterial road networks that we can do a better job. It does take some computer assistance in order to do this. One of the things that we have done is to install—it started with the 1984 Olympic games, since then we have expanded the program—was to synchronize our signals and reduce the congestion which often builds up when the signals are not well synchronized. Eventually, we planned to have that program city wide. Thus far it covers the area from downtown Los Angeles to the coliseum. It covers part of the Ventura Boulevard area. We are going to Hollywood, to West L.A. and to the Westchester area with installations there. We think that is going to be a major impact in reducing traffic congestion and thus reducing air pollution.

Mr. MINETA. Mr. Hastert.

Mr. HASTERT. Thank you, Mr. Chairman.

It certainly has been an honor to have you before us today, before this committee, and I have to say that really my first trip ever to Los Angeles was during the 1984 Olympic games and we came and travelled across country by car and really expected a great deal of congestion here. You folks did a great job in being able to move people around and to prevent that.

In an issue here that is before us and certainly a lot of the leadership, as we said before, what happens in this country comes out of your delegation in the U.S. Congress and one of the reasons I am

here even today is to find out how you people are going to deal with the Clean Air Act.

Again, it was leadership out of your delegation, out of your city that set many of those standards for automobiles and it is interesting to see that you are struggling to try to deal with that too, just as the metropolitan area of Chicago, that I represent, are having their problems also. As you look at what the existing federal surface transportation programs are today, the acts that we have, as we move in, focus and write a new law. What things do you think the Federal Government should do to adequately support, or should they, to adequately support your efforts to reduce traffic congestion through demand management programs?

Mr. BRADLEY. I wish I could give you a concise answer to that. The recognition that federally supported transportation programs, such as our light rail system that are installed in several cities in California, the underground system that works so well in Washington, D.C., and Atlanta—and we fully expect that it is going to do the same thing in Los Angeles and San Francisco—these are areas where we think that if we do an adequate job we will greatly reduce the air pollution problems that now exist or will exacerbate it if we fail to do anything in this regard.

So I think the surface transportation programs recognizing this potential can be a great help to us in a cooperative effort to relieve this kind of problem.

Mr. HASTERT. Thank you, Mr. Chairman.

Mr. MINETA. Thank you very much, Mayor Bradley. I appreciate your taking time from your own busy schedule to be with us and share with us your testimony.

Thank you very, very much.

Mr. BRADLEY. Thank you. It was good to see all of you.

Mr. MINETA. I would like to call on the Honorable A. Norton Younglove, Supervisor of Riverside County and Chairman of the District Governing Board of the South Coast Air Quality Management District.

It is great to have you with us and your testimony will be made a part of the record and if you will go ahead and proceed in your own fashion, sir.

TESTIMONY OF HON. A. NORTON YOUNGLOVE, SUPERVISOR, RIVERSIDE COUNTY, CHAIRMAN, GOVERNING BOARD, SOUTH COAST AIR QUALITY MANAGEMENT DISTRICT

Mr. YOUNGLOVE. Thank you very much, Mr. Chairman, Members of Congress.

I would like, first, if I might, to wear my Chairman of the Board of Supervisors Riverside County Hat for a moment, harkening back to your questions on bill boards. I would give two strong words of encouragement, one is that however you deal with billboards, you make the language as clear and precise as possible. And the reason is that even threatening or thinking of removing billboards causes very vigorous hard-pressed law suits and we find that, no matter what the loss, it is very, very difficult to remove them and obviously the more precise and clear the law is the better the opportunity of removing billboards where it makes sense.

The other comment, our county in the Coachella Valley in particular, which is where you find Palm Springs, Indian Wells and so forth, is checkerboarded by Native American ownership and as you know we are much more limited legally on what we can do. California law does not uphold, neither does ours. The only law that really does uphold is congressional. Our efforts to clean up billboards are necessarily pretty much doomed to failure unless clear consideration is given to this Native American land ownership, because of the checkerboard pattern where roughly 50 percent of any road frontage is over a period of miles going to be owned outside of our state and local jurisdiction.

Let me now shift to comments on behalf of the South Coast Air Quality Management District.

We represent over 13,000 square miles and over 12 million residents, Los Angeles, Orange, and Riverside counties in their entirety and the non-desert portion of San Bernardino county.

With over 7 million work trips each day obviously traffic congestion and traffic flow is a very major source of air pollution. Improving mobility and air quality are both essential to the economic vitality of the South Coast Air Basin and frankly a part of the reason for that is we are under legal requirements with either version of the Clean Air Act before Congress or the current Clean Air Act to meet certain health standards.

To the extent that we cannot get it from our transportation system, it must be gotten from the stationary sources and the severity of our problem is such that could lead literally to shut downs of certain types of business and industry. I think that more than anything accents the importance of achieving the amount of air pollution reduction through transportation improvements that our plan calls for and that really our situation calls for.

I will not go into the details of our pollution or the amount contributed by the automobile. I think you all know a very major source is the automobile and I am sure it is well known that our air basin is the most polluted in the country. That is in spite of the fact that we have got, on average, the strictest regulations in the country.

There are three reasons for that: one, is coastal breeze, mountain ring and all too often very low inversion layer which just does not give us much atmosphere for the pollutants to mix up in, and another is population growth, and the other obviously is the inadequacies of public transit combined with long travel distances being all too typical for employment purposes.

The state legislature has been very helpful to us in providing the legislation needed. I should note, however, the current state legislature requires that we make a 5 percent a year improvement. In the past, even with all of the actions we have taken, it has been at the rate of 1.5 percent a year. Actually, that is 4.5 percent a year but population growth erases 3 of that 4.5 percent. So, we obviously have some very strict additional actions that need to be taken and again far and away the most economical of those are in the transportation area.

I would like to share with you some of the principal objectives of our regional mobility plan which are incorporated in our air qual-

ity management plan. The principal objectives of the mobility plan are:

To obtain and maintain mobility in an environment of rapid population economic growth;

To accommodate the transportation demands of people and goods given the adopted growth management forecast;

To induce changes in travel behaviors that will lower the number of home-to-work trips, increase vehicle occupancy and provide the support to construct the necessary infrastructure;

To achieve an efficient balance among all modes, including new technologies;

To maximize use of existing facilities through system and demand-management techniques;

To support a pattern of development that shortens trip lengths through comprehensive planning.

For example, you heard Supervisor Riley earlier today note his district, they have got three jobs for every resident. In substantial portions of my district we have got three people working outside of the county for every one working inside of the county. Obviously you have got a job/housing imbalance situation there and probably our two districts represent that and illustrate that as well as anywhere in southern California.

You can assist us in achieving our goals by supporting and giving priority to funding programs for improved mass transportation facilities that are likely to reduce trips which would otherwise be made in automobiles.

By supporting and giving priority to funding the development of High Occupancy Vehicle lanes whenever capacity improvement projects are proposed rather than simply adding new general purpose or mixed-use lanes to our already overcrowded freeways.

You can do this by supporting transportation system management investments which will allow us to manage the existing system better and more efficiently. For example, traffic signalization projects and technological improvements such as the City of Los Angeles smart streets and truck management programs which will improve traffic flow and reduce emissions.

By supporting programs which will limit vehicle use in heavily congested areas during peak travel periods where emission concentrations are particularly high.

Significant additional congestion reductions would be accomplished without public expenditures for transit improvements if Congress would direct EPA to provide realistic allowance for trip reductions as a part of meeting stationary source air quality requirements.

To be more specific, a stationary source through moving closer to its employees or clients, could achieve significant air quality and traffic congestion gains but is unable to meet the EPA permanent requirement since nothing is forever, and you cannot guarantee that those trips, those employees, those clients will last forever. Changing that to be based on current or required portions of future employees or clients, or even over an analyzed five-year period or any other reasonable criteria, but not the current infinity.

Supporting requirements for employers to reduce work-trip-related emissions would be helpful. We have a program in the South

Coast Air Basin which, as of today, affects more than 1 million employees working at over 1,700 companies or institutions, including government. We expect that 8,000 companies will be in compliance with this regulation within a year.

In addition, the inequitable treatment for tax purposes of employer sponsored programs to accomplish trip reduction is a major hurdle to maximizing the effectiveness of this trip reduction program. You can support changes in the tax structure to give equal treatment to employer sponsored parking and other transportation options such as subsidized bus passes, van and pool subsidies or carpool incentives.

Many of these programs can be supported by a fundamental change in the way transportation funds are allocated. Flexibility is required so that local and regional officials can decide which transportation investments are most effective and efficient for the region, rather than being constrained by formula allocations based on project categories. This change can level the playing field for transportation investments and eliminate the inherent bias in a system where certain types of projects are favored or given proportionately higher federal subsidy.

By the same token, local and regional agencies need to assure the Federal Government that transportation funds are spent efficiently and that selected projects which are built with federal monies will improve mobility. This can be accomplished by incorporating improved conformity provisions into the federal Clean Air Act that would require local, regional, and federal transportation projects and plans to conform to air quality management plans such as ours.

The Senate version of proposed amendments to the Clean Air Act contains an improved conformity requirement. We strongly support the Senate's version because it will allow Southern California to reach attainment. Without a federal requirement for conformity review southern California may not be able to achieve federal clean air standards within the time frame set.

Thank you for allowing me to testify today. I appreciate the opportunity.

I would be very happy to answer any questions you might have.

Mr. ANDERSON. Thank you Mr. Chairman. Mr. Younglove, the South Coast Air Quality Management District has supported efforts to reduce vehicle use in heavily congested areas during peak travel periods. Now with regard to the trucking industry how will these restrictions affect their operations, include any affects on interstate commerce?

Mr. YOUNGLOVE. We are convinced through the pilot program, and that is essentially what it is, in the City of Los Angeles, that it will be possible to demonstrate that it will not have a negative affect on the trucking industry and those that have to make use of it. This is not easily done, this is why it took many months—something in the neighborhood of a year as I recall to develop that plan.

We have worked closely with them and it is a matter of reducing the peak hour but not unduly interfering in the necessity of the various truckers to serve their many and varied clients. It means obviously more use of trucks at the off peak hours and for that matter more efficient use of the trucks and some changes in the

patterns of just where they park when they are between the hauling either to or from—a variety of changes.

I might add build into that plan is a review panel which will include membership from our district so that as a problem arises with any given industry whether it is the clientele receiving the merchandise and the truck or the trucker, be able to review it and adjust the plan accordingly. I am confident it will work but obviously having not been tried before there are some unanswered questions.

Mr. ANDERSON. The House and the Senate will soon meet in conference to resolve the differences between their respective versions of the Clean Air Act. Now I understand from your testimony that you support the aspects of the Senate passed bill or the House passed version. Could you elaborate a little on that for us?

Mr. YOUNGLOVE. Generally speaking, we prefer the Senate version, however, as you know these are both very lengthy detailed bills. There are aspects of the House version that we prefer over the Senate version.

For example, and this is in the opposite direction, as I understand it the finalized version to this point of the House bill provides for off-road equipment exemptions. We are very much opposed to that. Again, based on the fact that every bit of pollutant that comes from those sources that is not, therefore, within our control is simply that much more we have to get out of the controllable stationary or mobile sources.

In other words, somebody is going to have to pay the piper on that addition. Probably the single most important thing to us would be the version that provides the maximum incentive and opportunity for alternate fuel vehicles because that in our basin is not just important, it is essential. Our basin cannot meet health standards with current or foreseeable diesel or gasoline fuels so we have to have those alternate fuels. And cleaner cars for California is another area that we would much rather was made a national standard. Not only does it reduce the price and make it more saleable but frankly also from the fact that at any given point in time, today for example, 20 to 25 percent of the cars operating in our air basin are out of state cars that meet the lesser standard. That again, is that much more air pollution that we have to compensate for somewhere else.

Mr. ANDERSON. How would you structure the federal highway and transit programs so they would provide a more neutral form for highway and transit decision making in our urban areas?

Mr. YOUNGLOVE. Well, the primary criteria I would give obviously, with the built-in biases that clearly I have, is that the transportation investment be beneficial to air quality. That, frankly, is so directly related to congestion that I cannot picture where there would be conflict.

We very much need a balanced program and that is HOV lanes, money for synchronization of signalization, smart highway type activity where that is feasible. But in a like manner, your public transit capability is sort of lacking here in southern California and needs a very major investment in order to upgrade that to an acceptable level. So we very strongly support a balanced program without all of the accent being given in either direction.

Mr. ANDERSON. Thank you, Mr. Chairman.

Mr. MINETA. Remind me if you would, Mr. Chairman, what is the relationship between the South Coast Air Quality Management District and the state air resources control board? Are you a subunit of it?

Mr. YOUNGLOVE. No. We are an agency of the state. That is, our district is created by the state and we have two primary responsibilities. One, is to make the regulations and enforce those regulations on stationary sources. The other is to develop a plan that will bring our district into compliance with federal law. It is in that latter area that we get involved in such subjects as transportation, alternate fuels and so forth.

The Air Resources Board is a direct state agency, as compared to an agency created by the state, and their basic responsibility is on the mobile sources. So your basic regulations of emissions per mile or from type of fuel and composition of the fuels and so forth, that is under the state Air Resources Board. We are supportive of each other but neither is subordinate to the other. We each have a primary role and then support each other in our other role.

The Air Resources Board also does have, as does the Environmental Protection Agency, the ability to reject any of our stationary rules if we feel that we have failed to comply with the law by going far enough. Typically, when they object they are saying we did not tighten the screws tight enough and sometimes for that matter EPA says that same thing to both the ARB and our district.

Mr. MINETA. If you wanted to, would you be in a position to say recommend the taxing of or increased taxing of downtown parking lots in order to leverage the use of automobiles into central cities?

Mr. YOUNGLOVE. I believe in user fees, and so not only parking lots but frankly existing as well as future built roadways to my mind are all legitimate for taxing. To me those are all user fees and I might add I would certainly insist, as I suspect all of you would, that those dollars not go off for other types of services but be limited to use in the transportation service field.

Mr. MINETA. And what kinds of things do you think that we might be able to do from a transportation perspective at the federal level to more quickly bring about improvements in air pollution?

Mr. YOUNGLOVE. This is going to differ from one place to another but looking at our air basin obviously substantial help can very well be used in building a public transit system beyond its current very anemic levels. In like manner, extremely important is the development of the HOV lanes for our freeway network, and I do accent the HOV lanes as compared to additional lanes.

Clearly, also there are certain bottleneck areas which cause horrendous congestion and that is where the automobile is operating the most inefficiently in creating far and away the most air pollution per mile. So attention to those bottleneck areas whether by reason of bridge or not enough lane widening on a given freeway that is being served by several others or whatever the reason might be.

Another area clearly that we could all use all of the dollars that we can find is in the traffic signalization area because again that is where a lot of congestion that is not really necessary is accomplished and frankly I personally would love to see the Federal Gov-

ernment do as the state has and provide some level of incentives whether financial or otherwise for those that pay more than the necessary matching area. Those that in affect have taxed themselves, as several of our southern California counties have, to beef up the effort to improve transportation.

I think your assisting in rewarding those that are making above the requisite effort would pay off very handsomely. It might even help encourage the voters of Orange County to decide to join the board.

Mr. MINETA. I know that Riverside County is growing rapidly but are you also being impacted by vehicular pollution that traverses your area, it is not vehicles that are registered in your county but because they are travelling from, I do not know, let us say San Diego through Riverside County on their way to Las Vegas or Indio, to where ever they are going, is there a lot of that kind of impact in Riverside County and how, if that is the case, and you get impacted by that vehicular traffic and the impact of its air pollution, how do you deal with it if that is more of a problem than, let us say, even the stationary sources that are in the local area?

Mr. YOUNGLOVE. It is more of a problem but you have to understand that our principal problem is the air pollution from the upwind areas. We get about 7 percent of our pollution from Riverside County and San Bernardino County is about 8 percent. The remainder is Orange and Los Angeles counties. If there was a magic wall we could put up and prevent that other, that would solve an enormous portion of our air pollution.

I made that comment to make it clear that our pollution is related very heavily to other areas and for that very reason we have a very strong stake in improving the transportation system in Orange and Los Angeles counties as well as our own because it has the air pollution pay off to us.

Our primary through the county transportation frankly is from San Bernardino County to places of employment. I would give a much less impact answer if I were to answer the inland empire, Riverside and San Bernardino combined. And we put a lot of traffic through their county too. That maybe is more of a technical type. A lot of our transportation obviously is people coming into the state because we are a major entryway from the state, both San Bernardino and Riverside counties. That relates quite heavily, I might add, to trucks in particular boiling up Interstate 10 through first Riverside and then San Bernardino counties. And that is significant.

I happen to know also, that a lot of the true traffic frankly is weekend vacationing traffic, our people going to the coastal plain down here and the people in this area going to our mountains in the Colorado River. There is just a tremendous amount of population, not just on the work days but Friday afternoon and early Saturday morning and then Sunday evening probably worst of all. So a lot of intracounty traffic passing through our county is that traffic that is meeting the recreational needs of southern California.

Mr. MINETA. Very well. Thank you.

Mr. Packard.

Mr. PACKARD. You referred in your statement to the reduction in work related trip emissions. Could you explain a little bit more

about that program? How are companies affected and how long has the program been in effect and do you have some definitive results yet?

Mr. YOUNGLOVE. The program has been in effect for a bit more than a year but it has not been in effect long enough to have substantial results that would be worth showing.

We would expect within six months to have much more substantial results. Our Regulation 15 began with those employing 500 or more at the same site. Works its way down now to those with 100 or more at the same work site and what it does, it requires that the company—and again I will accent that, that means government agency, university, hospital, whatever. This does not apply just to the private sector. It applies to all of us.

My county, for example, has seven sites that are affected by this regulation. It requires that you hire somebody to work the plan and that you draw up a plan that meets specific stated objectives. Currently the average in the automobile is 1.1 person and the objectives depending on location and some other things range anywhere from about 1.3 to about 1.7.

Annually that plan has to be reviewed and if it is not succeeding than it has to be improved. So the regulation requires that the companies hire a person to work the plan and draw up a plan which is approved by the district. But it does not require any individual to do anything whatsoever. So, basically, it is requiring an incentive plan. It does not go so far as some have encouraged we do to say that you can mandate employees, you know, ride sharing or using public transportation or using a certain amount of telecommunications or alternate work hour shifts or other things. And obviously we hope to not ever have to go to that point because the voluntary through—requiring a plan but still the incentives are what makes it work is obviously much preferable.

Mr. PACKARD. Look at addressing personal trips rather than only work related trips. I think nationwide less than half the trips are work related and thus the percentage of impact could be less than 10 percent. In fact, about 4 percent if you had rather significant compliance of work related.

Mr. YOUNGLOVE. Yes, sir, we have looked at that and I would expect, and I cannot assure you of this, it is not something that is a matter of official district policy, but I would expect that we will follow this Regulation 15 requirements relating to work within a reasonably short length of time, say a year or two, to places of concentration, your shopping centers and what not and of course that will then get very directly to your non-work related.

Another idea that definitely is not a part of district policy, but I personally favor, is to have a partial toll road situation on our major arterials during the peak traffic hours and a way that could be made to work relating directly to what you said would be to have a no-toll for those whose car has an identification that it is a necessary part of their work.

In other words, I live here and I work there. You identify the car accordingly and it would be only those using the peak hours, but not for work purposes, that would have to pay a toll. We do know that a very significant amount of the peak traffic load traffic is not work related. It is people travelling for some other reason. And it

seems to me it would not be asking too much of the public to either pick a non-peak hour for that travel or if they must join the work crowd than to pay a bit of a toll for doing so.

Mr. MINETA. Okay, Mr. Chairman thank you very, very much for sharing with us your expertise from the Air Quality Management district. It is such an important facet of what we are doing and a lot of times, frankly, I come to the conclusion that air pollution is going to be much more of a determinant of transportation policy than sometimes what we will be doing in terms of our own legislation. So what you are doing is very important.

Mr. YOUNGLOVE. Thank you very much, Mr. Chairman, and I wish you all the very best of luck and wisdom both. Those of you that are going to serve on the conference committee on the Clean Air Act, that is certainly not one of the easier things Congress has had to deal with.

Mr. MINETA. You are right, thank you very, very much.

At this time I would like to call on the Honorable Evan Anderson Braude, Councilmember of the city of Long Beach to come forward for his testimony.

Mr. Braude, we have your testimony and so if you would go ahead and proceed.

TESTIMONY OF HON. EVAN ANDERSON BRAUDE, COUNCILMEMBER, LONG BEACH, CA, ACCOMPANIED BY ED PUTTS, CITY ENGINEER, LONG BEACH, CA

Mr. BRAUDE. Thank you Chairman Anderson, Chairman Mineta, Congressman Packard and Congressman Hastert. Good morning. It is not morning, good afternoon. My name is Evan Anderson Braude and I am the Councilman from the 1st District of the city of Long Beach. With me today is our city engineer, Ed Putts, who will be happy to answer any questions along with myself at the conclusion of my testimony.

I am here today representing two organizations: the city of Long Beach and CRASH, Citizens for Reliable and Safe Highways. I will, of course, endeavor to keep my oral remarks brief and therefore ask permission to have my written statements submitted for the record.

First let me welcome you here today to our great city on behalf of Mayor Ernie Kell, the City Council, and all the Citizens of Long Beach.

Long Beach has many modes of transportation. We have a commercial airport, three interstate highways, and a variety of state routes running through our city. Our public bus system, Long Beach Transit, is rated the number one public bus company in North America.

On July 14th, Long Beach will be home to the new metro Blue Line linking downtown Long Beach with Los Angeles, as you have already heard. This line was completed with no federal funds. Clearly the City of Long Beach recognizes the importance of transportation. These improvements have to be accomplished through intergovernmental and public private partnership in order to allow necessary growth without endangering the quality of life of our community.

Today, I would like to talk about three projects that with the support of the Congress will help make a positive impact on our transportation infrastructure.

The consolidated transportation corridor project, a dedicated rail and truck roadway is essential to moving goods in and out of the ports of Long Beach and Los Angeles. Improved road and rail access to the ports will not only help these ports grow but reduce noise, disruption and pollution in Long Beach neighborhoods and our surrounding communities.

Through the assistance of the Chairman and Members of this committee, the ports access demonstration projects funded in 1982 and 1987 have been a major factor in the ports continued successes. Support for this project has also come from the citizens of California. Thanks to the passage of State Proposition 116 last month $80 million has been specifically earmarked for grade separations along the Alameda Street Corridor.

The ports of Long Beach and Los Angeles play an important role in national defense, trade, economic development for this nation. Specific federal support is appropriate to add to the support already for this project.

The second issue of concern to the city is the improvement of the interstate highways that currently run through Long Beach. The Interstate 710, the 405, the 605 freeways are an important part of the region's transportation system.

Therefore, the city supports the addition of High Occupancy Vehicle lanes to these freeways providing efficient and effective commuter mobility. Funding for these HOV lanes should be included in the 1991 Surface Transportation Authorization Act.

One innovative way that the City of Long Beach is trying to mitigate traffic problems in the city is through the Long Beach Airport Surface Access Project. This project would create an assessment district around the Long Beach airport to fund $24 million in traffic improvements. This project is unique and brings the city and business owners in the area together in a joint project to make many needed improvements caused by the continued development at or near the airport.

The Long Beach Airport Surface Access Project would benefit our national defense and commercial aviation industry by allowing for necessary management of the increased traffic caused by McDonnell Douglas' aircraft operation as well as strengthen our local and regional economies by assisting the growth of the businesses located near the airport. This project will allow all of this growth to occur without a negative impact on the nearby residential areas.

The projects I have discussed so far have both regional and national impacts. However, Long Beach is also very concerned about the transportation needs of our own community. Our city has identified a total package of $232 million in transportation improvements that are essential to the growth and well-being of this community. The package is balanced between auto and transit and its funding is divided between public and private sources. Through state-of-the-art computer modeling, the city has identified major traffic bottlenecks.

38-253 O—91——65

One such problem is known as the iron triangle in the east Long Beach area, where state route 1 and 22 and Bellflower Boulevard all intersect and cause over 100,000 vehicles per day to crawl through inadequate intersections. The solution is a $40 million grade separation to increase road capacities for major traffic flows.

The 1991 surface transportation authorization Act should provide for reliable and flexible funding to cities that are ready to implement a balanced, comprehensive transportation program such as the one we are now beginning.

Chairman Anderson, Chairman Mineta, and Members of the subcommittee, thank you once again for coming to Long Beach today. You could have picked no better city to focus attention on the need for transportation improvements. The City of Long Beach has taken the lead in many areas to address important transportation issues with the help of the surrounding governments. We will continue to implement solutions to mitigate traffic congestion. However, the help and support of Congress is also needed to see us through all of these solutions.

Now in addition to speaking on behalf of the City of Long Beach, I am also representing CRASH. This is an organization of citizens who are concerned about a variety of transportation issues.

However, I would like to talk about triple and twin 48 foot trailers being allowed on our nations state highways and streets. The use of these trailers will not only cause much unneeded congestion on the highways, but also presents several serious safety hazards. The American Trucking Association has proposed the twin 48's and triples be allowed not only on the 44,000 miles of interstate highways but also on the additional 100,000 to 120,000 miles of secondary roads. Additionally, they may be allowed on almost all city streets because of the reasonable access rule the department of transportation recently announced. This is outrageous.

I have conducted a quick analysis of where in Long Beach twin 48's and triples will not be allowed. As you can see from this map, and by the way the map that I have here is the most restrictive language to those. They will be allowed just about everywhere in Long Beach and the red lines represent the interstates and the freeways, the 91 up at the top on the far left hand side is the 605 in sort of on the right hand—right hand side down there, that is the Long Beach freeway, the 710. Ninety-one is running along the top. The 605 is running along down there and the 405, of course, is running across. You have the 22 a little farther down.

Now, the areas that are green there are what we think if the most restrictive DOT rule were to take place would be—those areas would not be impacted by the additional truck traffic. But under a liberal interpretation, none of that would be protected. In fact, and it still destroys or potentially could damage all those other areas that are not colored in with green by truck transportation, could really clog our streets.

In 1985, a AAA study of an Automobile Club concluded that the cost of truck accidents in Los Angeles County was $190 million. $120 million of that cost was lost time for passengers in autos stuck in gridlock caused by truck accidents. The study went on to the find that if triples and twins 48's are approved, not only will there be more accidents, but the accidents will block more lanes of traf-

fic. This finding was born out this past May 27th in Portland where a 37 year old man was killed and seven others were injured when a triple trailer slammed through a concrete barrier on Interstate 5 and collided head on with oncoming traffic. Because of the trucks size, this accident blocked lanes of Interstate 5 for eight hours. This accident not only demonstrates the congestion problems an accident like this can cause, but also raises many concerns about the safety of triples and twin 48's.

All of us have driven highways surrounded by trucks. The potential hazards these trailers present today are staggering. But the thought of having even larger trailers on our streets and highways seems totally incompatible with automobile traffic.

Not only would these trailers present a hazard on the streets, but the on and off ramps in Long Beach for our interstate highways are not large enough to accommodate the sweeping turns, the triples and twin 48's must take when turning. Without necessary costly adjustments these trailers would run over sidewalks, signs, lawns and even pedestrians.

The true dangers associated with these monster trucks were detailed in a study by the California Highway Patrol. Some of the hazards associated with these trailers if their use were expanded are included in my written statement.

Chairman Anderson, Chairman Mineta and Members of the subcommittee, these oversized trucks should not be allowed on the streets, the interstate and state highways of Long Beach, California or elsewhere in the United States. It is clear that the congestion that these trailers would cause would aggravate an already heavily impacted transportation infrastructure adding to our traffic gridlock.

In addition these trailers would pose a grave safety hazard in the event of a collision. This danger could come from the spill of toxic chemicals and I might point out to you that I have passed out to you three examples. In four days in the Long Beach area—four days—we have had three tanker trucks overturn and spills. In addition, this danger could come from the spilled toxic chemicals, trailers running into automobiles or other trailers or from vehicle collisions caused by spilled cargo from the trailers or a combination of all three.

I thank you again for the opportunity to speak today on behalf of both CRASH and the City of Long Beach and I and Mr. Putts would be happy to answer any questions.

Mr. MINETA. Thank you very much, Mr. Braude, Chairman Anderson.

Mr. ANDERSON. You mentioned that the Long Beach transit is rated the number one public bus company in North America. On what factors was the rating determined and what distinguishes your public bus system from other bus systems?

Mr. BRAUDE. Well, that is good. I have a feeling Mr. Larry Jackson may be around here a little later. Unless he is here today, I could not give you all of those factors. I do know that as a Congressman you are aware of the wonderful things that they do. The best use of money, most efficient, I think, in the transportation routes. I would not be knowledgeable in all the other areas however.

Mr. ANDERSON. We got them some of their money, remember too.

Mr. BRAUDE. Well, I know, that is positive.

Mr. ANDERSON. Do you believe that Long Beach Transit will be able to fully implement federal mandates required by the Clean Air Act and the American's With a Disability Act, both expected to become law this year without any increase in federal dollars for transit? Are fare increases or service reductions a feasible possibility for the transit operator if more federal dollars are not forthcoming?

Mr. BRAUDE. Well I am assured by staff that we have a lot of very committed projects. But we will endeavor to do what we can to make sure that all of those acts are complied with. However, there is no question in my mind and I am not sure if Mr. Putts would have an addition to that, that additional funds for the Federal Government to help us implement some of the measures of those acts would greatly help us do that in a quicker manner.

Mr. ANDERSON. My last question is to what degree do you project the opening of the metro Blue Line, the light rail system linking downtown Long Beach with Los Angeles on July the 14th, will reduce congestion on Long Beach streets and highways?

Mr. BRAUDE. I am hoping but no one ever knows for sure. We have had some demonstrations of the line already in different parts and we see a lot of interest from people to take that line. It does come down into my area. I represent the lst district. This is the area you are all in right now. And I think that it would go a long way in helping commuter traffic both into Long Beach and into Los Angeles. It is a good secure route. I know that Mr. Grabinski was here on an earlier panel and probably gave you a lot of the positive comments that they believe but the studies show that it would be very helpful to reducing some of the congestion that we have and it certainly would go a long way in the future of bringing another mode of transportation that is greatly needed.

Mr. ANDERSON. Thank you, Mr. Chairman.

Mr. MINETA. Thank you, Mr. Chairman.

In your testimony you referred to the consolidated transportation corridor project.

Mr. BRAUDE. My fellow colleague on the City Council, Mr. Kellogg will be, I believe will be speaking in a few turns down the line to this very issue. But what can I answer for you.

Mr. MINETA. Well maybe I will just wait until he testifies then.

You mentioned that the American Trucking Association has proposed that twin 48's and triple 28 trailers be allowed on interstate and secondary roads. It is our understanding that the ATA is not currently seeking federal legislation to allow greater use of these bigger trucks but has said that individual states should be able to grant specific authority or permits to allow them in their states. Could you comment on this?

Mr. BRAUDE. Well it has been my understanding that that is not the case that they are working to try to eventually have the entire country turned over as they did in 1982 with adding and expanding the double trailers. I think it was back there in 1982, when I think, even though they were not allowed throughout the entire states that the ATA came and asked for federal legislation to demand that they be allowed in all states. I think that they may be, at the

present time, asking individual states be allowed, so that eventually they can come to the federal authority as they did in 1982 and ask for expansion of their authority.

Mr. MINETA. You said that if twin 48's and triples are allowed they will take up more space on highways and streets and will result in more accidents.

Mr. BRAUDE. I believe that is correct.

Mr. MINETA. With the increased productivity that these large trucks provide, is it not possible that less trucks will be on the highways and thus fewer accidents will occur because of a reduction in actual vehicle miles traveled?

Mr. BRAUDE. Well I thank you for that question. I have to tell you that the studies that I have seen most recently would not encourage that conclusion. The latest one that I was aware of was a study that was done that included single unit trucks, tractor only with bobtail, tractor single trailers, twin 28's, Rocky Mountain doubles, truck trailers, and in that study what was done, the twin 28's, or 48's and the Rocky Mountain doubles accounted to a ratio of over three to one.

In other words, if their sample was only 5 percent, excuse me, 1 percent of the trucks on the road were Rocky Mountain doubles and yet they accounted for 3 percent of the crashes, where single unit trucks which accounted for 23 percent of that sample only accounted for 8 percent of the crashes involved, and we deal with the same amount of miles and the same amount of location. So I really do not think that that is accurate. The fact is the studies also show that the trucks, they are much more difficult to control and to supervise. They sway more, there is all kinds of actual problems with larger trucks.

As far as being more economical, I believe that probably is true. The problem here is that originally we had single trucks on our highways, I think the argument was, "Well, we need to have more economy, we need to be able to put larger trucks out on the road and we will have less trucks in the long run." That is not the case. We have more trucks now than ever before. And I think that has to be looked at, that if we allow the larger trucks on we may have a smaller number in the very beginning but as the years grow, we will end up having many, many more. And frankly, I do not want to drive nor do I want my citizens to have to drive on surface streets in my community with trucks that as you can see are this large.

It is just clearly inappropriate for one of these trucks to be driving down Long Beach Boulevard or Broadway or any of the other streets that you have been driving around in my community in the last few days.

Mr. PACKARD. It almost needs a caboose on it, does it not?

Mr. BRAUDE. That is right. In fact, I am wearing a badge which says, "We are for safer trucks," and somebody said to me in the elevator a little while ago, that is a train, is not it, not a truck? And I said, "No, this is a truck," according to what some people would like to see.

Mr. MINETA. Thank you very much.

Mr. Packard.

Mr. PACKARD. What is the alternative with greater and greater production in this country and more and more movement of goods, more trucks on our freeways, smaller trucks on our freeways, would mean more trucks? What is the balance and where can we solve the problem?

Mr. BRAUDE. Well, I think that, you know, with improved highways and the smaller trucks or the trucks that we have now, we should improve the safety of the drivers and of the trucks that we have already. That is one of our major problems. But I think that to increase our infrastructure as far as freight whether it be through rail or barge or some other mechanism, we should start working on that infrastructure. I think that other countries have done a marvelous jobs in that area. We are doing a pretty good job, but we need to improve it even more.

I am not saying that there is not an economy by having larger trucks in the sense of being able to haul. I am just really concerned about the safety factor. That is what really bothers me. I mean I get enough complaints in my office right now just upstairs here from our senior population, which I represent a very large percentage of seniors in my district, that hate driving along the street and having to go to the market and having these big trucks that are delivering goods to the markets. I am sure they would never get out on the highways if they had something like this.

Mr. PACKARD. I do not think you are going to see a strong effort to enlarge the trucks or to allow bigger trucks. At least not now and I am not sure that is requested but certainly the movement of goods is of concern and if we develop a new transportation plan we have got to recognize that economic factors are going to have to——

Mr. BRAUDE. You know, obviously if we had dedicated roads just for large vehicles like that it might be one thing, with terminals at certain ends. In other words that might be a consideration. But to mix them and match them with regular automobiles and small trucks it would potentially be a real hazard.

Thank you.

Mr. MINETA. Mr. Hastert.

Mr. HASTERT. Thank you, Mr. Chairman. Certainly we kind of veered off on an issue here that I think certainly everybody is interested in and it has a lot of different facets. You suggest that the ATA is trying to put the arm on to change legislation. I really have not seen that evidence, but they also suggested that maybe we change the bridge specs, bridge weight specs throughout the county that would certainly open the door to that state by state.

But it is interesting when you talk about the state of California in the truck traffic that you have, is there any feeling that because of state law that you have in your own state, you know about 40 percent of the trucks traveling up and down the roads of California are empty. They are back-hauling empty because of very constrictive state legislation that disallows back-hauling. And especially with private trucks and trucks that are not, you know, under the public utility commission's interstate jurisdiction or outside interstate jurisdiction. Do you think that may be a suggestion?

Mr. BRAUDE. I would be interested in looking into that and asking our state legislative body to be concerned with that. I saw

some information on the back-hauling issue. I know that your committee had quite a hearing on that several months ago which apparently showed up on ABC on national television in one of their reports, one of their programs. Back-hauling and some of the abuses of back-hauling so I would be somewhat concerned about making sure that we did not have some of the abuses of that at least were evidenced by your hearings.

Mr. HASTERT. That was back-hauling of garbage, but just trucks that are in every day freight business, we might want to look at economic entry.

Mr. BRAUDE. I think it is a real positive move to do that. I am not quite sure—I was not aware that we did not allow back-hauling of regular freight in——

Mr. HASTERT. As a matter of fact, Federal Express for instance is an entity that does a lot of business here in this state. If somebody wants to ship a package from Long Beach here to San Diego, that package goes to Memphis first and then to San Diego instead of putting it on a truck and being hauled from Long Beach to San Diego because of their restrictive entry.

Mr. BRAUDE. It is interesting, I was always thought that that was Fed x's way they do business as opposed to how we had done here.

Mr. HASTERT. No, because they cannot use truck lanes to do that. So anyway, it is interesting and you know that may be an area that we want to look into in deregulation.

Mr. BRAUDE. Well, I have some interest in the state too so I will be happy to bend their ear as well.

Mr. HASTERT. Well, maybe we may even look at the federal level, you never know.

Thank you.

Mr. MINETA. Thank you very, very much Mr. Braude——

Mr. BRAUDE. Thank you, Mr. Chairman.

Mr. MINETA [continuing]. For your being here. At this time the subcommittee will stand in recess and we will reconvene in a half an hour.

[Whereupon at 1:05, the subcommittee recessed, to reconvene at 1:35 p.m., the same day.]

Mr. MINETA. The Subcommittee on Surface Transportation will please come to order.

At this time I would like to call forward the Honorable Jeffrey Kellogg, a member of the City Council here in Long Beach, and member of the Consolidated Transportation Corridor Joint Powers Authority.

Mr. Kellogg, your testimony will be made a part of the record and so if you would go ahead and proceed in your own fashion.

TESTIMONY OF HON. JEFFREY KELLOGG, COUNCILMAN, CITY OF LONG BEACH, MEMBER, CONSOLIDATED TRANSPORTATION CORRIDOR JOINT POWERS AUTHORITY, LONG BEACH, CA

Mr. KELLOGG. Thank you. Chairman Mineta, Chairman Anderson and distinguished Members of the subcommittee, good afternoon. My name is Jeff Kellogg. I am the councilman from the 8th district of the city of Long Beach, and Long Beach's representative to the Consolidated Transportation Corridor Joint Powers Authori-

ties. I also serve as Chairman of the JPA's legislative committee. On behalf of the entire governing board of the Joint Powers of Authority and its chairperson, Los Angeles City Councilwoman, Joan Milke Flores, I would like to add my welcome to you this afternoon. I am delighted that you could be with us today in Long Beach. We are extremely grateful for your support you have shown for the transportation needs of Southern California.

Thanks to your leadership, Chairman Anderson, Chairman Mineta, and that of your colleagues on this committee the economic benefits associated with the growth of the ports of Los Angeles and Long Beach can be preserved. You have also championed the concept that port growth cannot be sustained without increases in port and railroad access to the ports. We could not agree with you more. We strongly believe that the consolidated transportation corridor is a key to facilitating port growth while assuring that the neighborhood quality of life is protected.

This project will create a highway and rail system of national significance connecting the economic center of the San Pedro Bay ports, the largest port complex in the United States, to the interstate highway system and the national railroad system, thereby moving international cargo. The project is designed to improve port access while mitigating potentially adverse impacts of port growth, including highway traffic congestion, air pollution, vehicle delays at grade crossings and numerous impacts on residential areas.

These are truly exciting times. As the gateway of the pacific rim, the ports of Los Angeles and Long Beach are experiencing dramatic growth. In 1989, the two ports combined handled a total of 139 million metric revenue tons of cargo, up 6 percent from the previous year. Growth in intermodal or containerized cargo accounts for a significant share of the port's recent success. The two ports handled a total of 3.6 million 20 foot equivalent units [TEUS] in 1989, an increase of nearly 14 percent over the previous year.

By the year 2020 the ports anticipated nearly 12 million TEUS annually. Train traffic to and from the ports is expected to increase from 31 trains per day currently to 106 trains per day by the year 2020. Truck traffic to and from the ports amounts to about 17,000 trips per day now. This could triple by the year 2020. With volumes of this magnitude, major improvements in rail and highway infrastructure will be required, and significant investments in mitigations, such as grade crossings, soundwalls, et cetera, will be necessary.

We strongly believe that the consolidated transportation corridor will provide the necessary mitigations as well as the needed improvements in the transport capacity. The Consolidated Transportation Corridors Joint Powers Authority is the agency responsible for implementing this important project.

Formed in August of 1989, the JPA has a governing board of 15 members, representing the cities of Los Angeles and Long Beach, the Los Angeles County Board of Supervisors, the Los Angeles County Transportation Commission, the two ports, Caltrans and each of the six cities along the corridor: Carson, Compton, Lynwood, South Gate, Huntington Park and Vernon. Members of the JPA are working together in a successful collaborative effort to

solve the infrastructure and environmental problems associated with improving port access.

The estimated cost—and I am glad you are sitting down—of the Consolidated Transportation Corridor is $205 million, not counting the cost of projects already funded through the Federal Ports Access Demonstration programs. Also not included in this estimate is $297 million of improvements in highway and rail infrastructure near the harbor that will be funded directly by the ports.

The Consolidated Transportation Corridor involves double tracking the San Pedro branch of the Southern Pacific Rail Line. And the map over there will show you the dark one, installing centralized traffic control. The goal is to have all three rail carriers, Union Pacific, Santa Fe, and the Southern Pacific, use this one upgraded route. The Southern Pacific San Pedro branch runs through a predominantly industrial corridor which is more compatible with heavy freight trains than the other railroad branch lines which are highly residential.

Concentrating our investments in grade separations and other mitigation in this one corridor makes good economic sense. The costs of mitigating impacts on all of the railroad branch lines serving the harbor would be astronomical and politically unfeasible or suicidal, whichever route the politician chooses to make.

The project also involves widening Alameda Street from four to six lanes from the port to Interstate 10 near downtown Los Angeles.

Fortunately, through the assistance of Congressman Anderson and the Members of this committee, funds for three of the grade separations and funds for the widening of Alameda Streets south of state route 91 are already available. The Port Access Demonstration projects funded in 1982/1987 have been a major factor in the ports continued growth and prosperity.

On June 5th, California voters passed Proposition 108, 111 and 116 which combined will provide a total of $18.5 billion in additional revenues for transportation projects over the next 10 years. $80 million from Proposition 116 is specifically earmarked for grade separations along the Alameda Street corridor. We have also applied for $25 million of Proposition 11 related funds for the widening of Alameda Street between route 91 and the Glenn M. Anderson freeway.

Additional funding for this project could come from mitigation fees collected by the ports and contributions from the railroads. We are making a significant state and local commitment to this project, but we also feel that federal assistance is justified. The San Pedro Bay ports play a vital role in international trade, economic development, as well as national defense. Thus, there is a strong compelling argument for specific federal attention to this project. We respectfully request that there be recognition and federal funding commitments for the Consolidated Transportation Corridor in the Federal-Aid Highway Reauthorization bill, which is currently being drafted.

Failure to build the Consolidated Transportation Corridor would being continued environmental hardships to the communities surround the harbor areas, as well as threatening a significant diversion of cargos to other ports. At stake are about 37,000 trade relat-

ed jobs that could be potentially lost by the year 2020 and $6 to $8 billion in customs revenues that would be lost if the ports proposed expansion was curtailed.

The consolidated transportation corridor represents a significant step forward in providing good movement, economic growth, while assuring that neighborhood quality of life are preserved. Working together, I am confident these goals can be achieved.

Thank you very much for your time. I would be happy to answer any questions you might have.

Mr. MINETA. Thank you very much Mr. Kellogg.

Chairman Anderson.

Mr. ANDERSON. Thank you Mr. Chairman.

Jeff, by the year 2020, the ports anticipate the Consolidated Transportation Corridor traffic will nearly triple. How will this affect Southern California's ability to meet federal clean air standards?

Mr. KELLOGG. Mr. Chairman, that is one of the reasons why the Consolidated Corridor is such a key ingredient in this entire picture for the L.A. basin. With this amount of truck traffic on the roads, trying to get that truck traffic off on to rails, it is greatly going to help the air quality of the L.A. basin. This is just one of many different facets for this proposal that is so encouraging.

Mr. ANDERSON. If the federal highway programs are restructured to incorporate a highway system of national significance, how would you justify the inclusion of local roads within the CTC on such a system?

Mr. KELLOGG. Because of the impact it does have on a national scale from the standpoint of much of the traffic going from the ports here in Los Angeles and Long Beach, the fact that it does run here heading towards Chicago points east. So it really does bring in more and more of a national significance than much of the cargo comes through here now. So I think we also look at, from a national standpoint, when I mentioned the $6 to $8 billion that we have, possibly that again, that impacts more federal than it will local. So I think we are incorporated in not only just the local impact but what it is going to do from a federal standpoint as well.

Mr. ANDERSON. Thank you Mr. Chairman.

Mr. MINETA. Mr. Kellogg, you say that the goal of the corridor project is to have all three rail carriers using one upgraded rail route, dedicated rail route, when it is built. Have those three carriers agreed now to use that one upgraded dedicated rail route?

Mr. Kellogg. Sir, you have asked the most important question that we have right now. We are presently working with the three railroads. We understand that without their cooperation in this project, we are all wasting our time.

The Federal Railroad Administrator, Gilbert Carmichael has been out, we have talked to them, I have talked to him, about having a section 401 which would meet anything in antitrust, to bring the three railroads together, understanding that one railroad who is the one that owns the right of way, that is something that is probably their crown jewel right now. We understand that they have to look at it from an economic standpoint and make sure they are compensated. Through the assistance of Congressman Anderson having the railroad administrator come forward and say he

will have a 401 with three railroads and sit down and try to work out some type of agreement because you are absolutely correct, without their cooperation we will not go on any farther.

But we also want to make sure that we maintain to the railroads that without their cooperation, the port will not expand, their cargo will not expand and therefore, they are going to lose in the long run as well.

Mr. ANDERSON. And when this Consolidated Transportation Corridor project is completed, do you have any estimates as to how much truck traffic will be diverted from the Long Beach Streets?

Mr. KELLOGG. I would hope, as we talk about the 17,000 trips per day that we are looking at now, I would hope that as substantial amount of that truck traffic would be diverted off on to Alameda, on to rails or on to Alameda as a truck corridor.

Mr. ANDERSON. And if the rail people do not come to an agreement on the use of one dedicated rail route, what happens then?

Mr. KELLOGG. As I stated earlier they will sit there as the port tries to grow with the cargo. The wave of the future seems to be on-dock rail facilities to put the cargo on and move. As a local elected official, and many of you probably can relate to very well, is that as the railroads want to have more traffic that will be going through those three existing lines right there, the one on the left and the one on the right—the one on the right runs through my district.

For example, that one has 33 grade crossings that will impact 16,000 residents. The one on the left has 92 grade crossings and impacts 26,000 people. The one in the middle, the Consolidated Transportation Corridor, that one has 34 grade crossings, I believe, and it impacts 7,000 people.

So, really, the reality of it all is from an elected official standpoint, as the ports want to grow, they want to have more access to putting on rails. Rail traffic then would be proposed to increase in the neighborhoods. That would be unacceptable for me as an elected official because it would be unacceptable for my neighbors. The neighborhoods would be devastated because of the amount of rail traffic running right through them. That is why it is a win for them as well. If they are willing to work with us we can all grow and prosper.

If it comes down to where they say that they are going to try to mitigate the other three lines, from an economic standpoint it does not make sense.

From a political standpoint, it makes no sense at all because I will be out there fighting, opposed to it. Because now they are talking about the quality of life in my neighborhoods. And that is something that I will not stand for and as most of you understand, if we want to do it, it is just political suicide, but it is not feasible as well.

Mr. MINETA. Mr. Hastert.

Mr. HASTERT. Would those other corridors be abandoned?

Mr. KELLOGG. Those other corridors would not be abandoned that I am aware of. They would not be, they could still be used.

Mr. HASTERT. Thank you, that is my only question.

Mr. MINETA. Thank you very much Mr. Kellogg and thank you very much for your hospitality.

Mr. KELLOGG. I think you almost had a quorum of Long Beach City Councilmen.

Thank you.

Mr. MINETA. Let me call on the Honorable Barbara Messina, Mayor of the city of Alhambra to come forward please.

Mayor Messina, your testimony will be made a part of the record and if you would go ahead and proceed in your own fashion.

TESTIMONY OF HON. BARBARA MESSINA, MAYOR OF THE CITY OF ALHAMBRA, ALHAMBRA, CA

Ms. MESSINA. Thank you Mr. Chairman and committee Members. My name is Barbara Messina, Mayor of the city of Alhambra. Thank you for the opportunity to speak today on a matter of great concern to our city, the completion of the Long Beach freeway gap.

Alhambra, together with 11 other neighboring cities representing over 3.8 million people, has adopted resolutions in support of the completion of the Long Beach freeway extension between the San Bernardino freeway and the Foothill freeway. Caltrans and the FHWA are currently reviewing the latest route proposal and they are expected to reach a decision soon. We are asking the committee to designate the extension of the Long Beach freeway as a priority primary project under the Federal Interstate Program.

The Long Beach freeway gap closure proposal has been the subject of study for almost 30 years. Since 1965, 24 alternative routes have been studied to complete the project with Interstate 210 in Pasadena. Over the years, there have been numerous designs proposed by Caltrans and others for the completion of the six mile gap in the freeway. The focus of this attention is a 6.2 mile gap in the 75 mile freeway system which rings the Los Angeles Central Business District.

This ring of freeways was primarily conceived in the late 1950's as part of the master plan for the primary central metropolitan Los Angeles area freeway network.

This construction began in the early 1960's and by 1976 approximately 71 miles or about 97 percent of the system was fully operational.

Closing the remaining gap would have the affect of fully connecting the Long Beach freeway with nine other freeways between the cities of Long Beach and Pasadena.

Alhambra has long been among the leading proponents of completing the gap in the Long Beach Freeway, which now empties onto Valley Boulevard in Alhambra, creating heavy congestion on many of the city's streets.

Commuter and truck traffic driving between the Long Beach and Pasadena areas, and points in between, must use surface streets between Alhambra and Pasadena because of the missing six mile section of the Long Beach Freeway. These surface streets were never meant to carry this extraordinary high volume of traffic. The result has been a tremendous degree of ever worsening traffic congestion on all north/south streets within three miles of the proposed route of the freeway link which becomes chaotic during peak commuting hours.

By completing the extension of the Long Beach freeway, Caltrans projects that we put between 150,000 and 200,000 cars on the freeway that are now on local service streets. Without the freeway, traffic on Alhambra's Atlantic Boulevard is expected to jump from 35,000 cars daily to 73,000 cars by the year 2000. In addressing this issue, it is important to distinguish between current traffic volume levels and traffic demand levels.

For example, if one views the traffic counts for Fremont avenue over the last several years, they have gone up an average of 2 percent per year which is seemingly manageable. However, what is not reflected in these counts is the fact that traffic volumes on Fremont avenue are and have been above the rated capacity of the street for over 10 years.

As a result, commuters frustrated by having to wait through multiple signal changes at virtually every intersection on Fremont have moved to the east and onto residential streets to find faster, even though longer routes through Alhambra, to Pasadena, or the Foothill freeway to the north. As a result, traffic volumes on Atlantic and Garfield, the two major north/south arterials to the immediate east of Fremont avenue have increased at some locations by over 4 percent or twice the rate as on Fremont.

Traffic on these two streets is now in excess of capacity and growing numbers of commuters are now winding their way through the residential streets of Alhambra rather than endure the congestion of the arterials. This is evidenced by the growing number of requests from Alhambra residents for speed bumps and stop signs to deal with ever increasing traffic.

In short, the traffic demand is increasing dramatically each year but it is not fully reflected in the traffic counts on the major streets because more and more commuter traffic is finding its way onto residential streets. The Long Beach freeway extension would remove some of the demand from the adjacent arterial network and thereby significantly improve conditions of those roads.

The freeway extension would relieve congestion and increase safety on local streets in the area of the freeway. Accidents are a function of the number of potential conflicts for vehicles and pedestrians. Reducing traffic speed correlates with a reduction of traffic accidents but conflicts with the goal of reducing delay.

One of the best ways to reduce accidents on a road is to reduce the traffic on it. If the traffic is transferred to a freeway both the accident rate and the delay would improve because freeways are inherently safer and faster than arterial roads, due to the reduced conflicts. In particular, streets that would be greatly benefitted are Valley boulevard in Los Angeles and Alhambra; Fremont avenue in Alhambra and South Pasadena; Fair Oaks avenue in South Pasadena and Pasadena; and California boulevard, Del Mar boulevard, Bellefontaine Street and Glenarm Street in Pasadena.

Closing the freeway gap could also reduce some truck traffic on Interstate 5 and relieve congestion on freeways as far away as Glendale and Whittier. Interstate 170 connects with two east/west freeways, Interstate 210 and Interstate 10, and interconnects with Interstate 110 and Interstate 134. The completion of the Interstate 710 would be expected to remove through truck traffic on Fair Oaks Avenue in Pasadena and South Pasadena, and Fremont and

Atlantic Boulevard routes in Alhambra. All these routes are presently heavily used by trucks. Additionally, once trucks are on Interstate 210 the extension of the freeway would permit greater access for trucks going to the Long Beach Harbor.

In light of the congressional efforts to improve the quality of our air through the Clean Air Act, the Long Beach Freeway extension would actually improve environmental conditions. The reduction in congestion would also bring about a reduction in vehicle emissions, improve the air quality in the basin as well as reduce vehicle-related noise along surface streets.

Some individuals claim that closing the freeway gap may actually exacerbate traffic problems by generating new traffic, but they are not persuasive. New highways may generate more traffic in still developing areas but there is not much room for new growth around the freeway gap. In fact, an analysis by the Southern California Association of Governments suggests that closing the gap will simply relieve congestion that already exists, primarily on the surface streets where traffic from the unfinished freeway currently winds up. Cars moving along a highway generate less air pollution than they do in stop and go traffic.

Completing the freeway is necessary for both local and regional traffic, relieving local traffic congestion and providing better access to Long Beach Harbor.

The six mile completion of the Long Beach Freeway was designated as a priority primary route under the Federal Interstate System in the 1987 Highway Bill. As the Surface Transportation Subcommittee considers the Highway Bill, we would ask that the subcommittee request priority primary funding in the 1991 Highway Reauthorization Bill for this project. The City of Alhambra would like to work with the Public Works Committee to ensure that funding is authorized for this vital freeway project.

Thank you for your consideration in this matter.

[Statement of Ms. Messina appears on p. 2268.]

Mr. MINETA. Thank you very much Mayor Messina. Mr. Chairman.

Mr. ANDERSON. Thank you Mr. Chairman.

Ms. Messina, have all the neighboring cities along the Long Beach freeway extension adopted resolutions in support of the project——

Ms. MESSINA. Yes——

Mr. ANDERSON [continuing]. And if not, which ones and why? So, if they all have, because I thought there was one or two that might not have——

Ms. MESSINA. We have received resolutions from Arcadia, Azusa, Bradbury, Bell Gardens, Cudahy, Duarte, Los Angeles, Monrovia, Monterey Park, Pasadena and Temple City. The Cities of San Gabriel and San Marino have chosen to remain neutral in this.

Mr. ANDERSON. The cities of San Gabriel——

Ms. MESSINA. San Gabriel——

Mr. ANDERSON [continuing]. And San Marino.

Ms. MESSINA [continuing]. And San Marino.

Mr. ANDERSON. They are the only two.

Ms. MESSINA. And South Pasadena.

Mr. ANDERSON. And South Pasadena.

Now over the last 25 years there have been over 24 alternative routes that have been studied to complete the project with Interstate 210 in Pasadena. Has the estimated cost to complete the project escalated with each review of the alternative proposals?

Ms. MESSINA. Dramatically each time. That is putting it very mildly.

Mr. ANDERSON. Is there any reason those three have not joined the rest of the—there must be 80 or 90 of you that have already joined and three of them have not, is there any reason?

Ms. MESSINA. I can only surmise that in speaking with several of the San Gabriel councilmen, they just do not want to be pitted against friendships in South Pasadena and then Alhambra. San Marino just prefers to stay neutral. Probably for the same reasons that I can surmise in speaking to several of the city councilmen in San Marino.

Mr. ANDERSON. What has been the primary obstacle in the road blocking the completion of this project?

Ms. MESSINA. The City of South Pasadena just feels that they do not want another freeway through their community and that is basically the main reason that it has been stalled.

Mr. ANDERSON. I would think it would help all of them so that they would all benefit.

Ms. MESSINA. I agree, but unfortunately, that has not been the case.

Mr. ANDERSON. Is there anything we can do to help it, or is there any movement to try to solve the problem?

Ms. MESSINA. Well, your support would be a great help. We are waiting for Caltrans to finish the fourth EIR report and we are hoping that that will prove that the alternative——

Mr. PACKARD. Would the Chairman yield for a moment. Is it included on the stip and how far away is it?

Ms. MESSINA. The EIR is supposed to be completed very, very, soon. That is what we get from Caltrans, so, we are waiting.

Mr. PACKARD. How much funding are you asking for from the feds?

Ms. MESSINA. I am sorry, I am not certain what are the latest cost figures.

Mr. PACKARD. I am wondering, is it scheduled for local participation?

Ms. MESSINA. Oh yes.

Mr. PACKARD. No more questions sir.

Mr. MINETA. Mayor Messina, thank you very, very much for your presentation here.

Ms. MESSINA. Thank you very much. I appreciate it.

Mr. MINETA. Now, I would like to call on the Honorable Luigi A. Vernola, the Mayor of the city of Norwalk.

Mayor, your testimony will be made a part of the record and if you would go ahead and proceed in your own fashion.

TESTIMONY OF LUIGI A. VERNOLA, MAYOR, CITY OF NORWALK, NORWALK, CA, ACCOMPANIED BY AL FUENTES, COUNCILMAN, SANTA FE SPRINGS, CA

Mr. VERNOLA. Thank you very much.

Mr. Chairman, Members of the Congressional Subcommittee on Surface Transportation. I am the Mayor of the city of Norwalk. I am testifying today on behalf of Norwalk and the Mayors and Cities of Santa Fe Springs and La Mirada.

At this time I would like to recognize Al Fuentes, Councilman from the City of Santa Fe Springs who is here with us today. Also earlier there was the councilwoman, Barbara Hayden from the City of Downey and I believe Mayor Lou Pelts from the City of La Mirada was here earlier.

As the subcommittee is aware, tremendous growth in southern California since 1950 has put great pressure on local transportation systems. This pressure has created an immediate need for creative and innovative mutimodal approaches to correct current shortcomings.

We asked to testify today to bring to the attention of the subcommittee our concerns regarding the widening of Interstate 5. Current funding provides for widening only to the confluence of SR-91 and again from I-605 South. This means that the link from the SR-91 to the I-605 is not funded through the cities of Norwalk, Santa Fe Springs, La Mirada or Downey.

With the understanding that the intent of National Transportation Policy is to look at improvements regionally, we feel the plan for current improvements would cause a bottleneck on the I-5 that would diminish many regional benefits. This departure from a regional transportation perspective has resulted in spotty improvements that will not improve the regional traffic needs. Currently, capital improvement dollars are spent where it is easy to do so, leaving more complicated sections neglected with the end result being a diminished regional transportation benefit.

Further, from a pollution standpoint, a bottleneck on the I-5 where it passes through our cities would have a tremendous air quality impact given the volume of traffic on this roadway. The slow down in this affected area would concentrate vehicles and their exhaust in our cities. Thus having an air quality impact that none of us is comfortable with and will have extremely negative pollution implications.

The section of roadway we are speaking about was constructed to the current design standards of the early 1950's. For the purposes of historical perspective, this was the first Federally funded section of the Interstate System. As we all know, it is a system that has kept America at the forefront of technology and an economic leader.

Our communities of Norwalk, Downey, Santa Fe Springs and La Mirada, developed along the I-5 corridor, currently are in the midst of redevelopment activities to bolster our economic viability as is necessary for municipalities to do these days. Clearly, if in the future the region is to remain economically sound and have a regional transportation perspective, improvements to the I-5 between Highway 91 and I-605 are a must.

However, we also have the responsibility of being protective of the business and industry that line the I-5 because of what they contribute to our tax bases and our respective city's service levels. We cannot endorse a policy that would devastate local business by

increasing the width indiscriminately of the I-5 right-of-way through our cities.

We do endorse a National Policy that would provide for the funding of improvements for this historic Interstate through a scheduled project. However, the economic vitality of our communities demands a creative, innovative approach to improvements and developments. For this segment, this translates into increasing capacity while staying with the current right-of-way.

Examples for the subcommittee's consideration could be:

Reversible lanes to handle peak hour volumes if the volumes are unbalanced;

Center express lanes for long-distance, through traffic that would be physically separated from local traffic;

An elevated, 4-lane express route to carry long distance through traffic with the lower 6 or 8 lanes functioning as a collector-distributor and short-haul facility;

Looking at designs that are safe but less than the current federal highway standards such as narrower lanes, tighter ramp curves and waivers from current design standards that work better in less densely developed areas.

Perhaps we also need to take a more aggressive stance in dealing with the motoring public and communicate that it is not possible to think in terms of one driver, one car anymore. We cannot let this mentality dictate our roadway needs. Let us look at designs that improve I-5 but not to the level demanded by future traffic volumes. We need to cooperatively develop alternative modes such as commuter rail, light rail, bus and car pools. It will be necessary to force the single driver into alternative transportation.

In closing, I would like to reiterate our desire to see the upgrading of the I-5 from the 91 to the 605. Endorse authorization of funds for the project. Encourage a National Policy that fosters creative and innovative capacity improvement alternatives that stay within the existing right-of-ways.

Finally, I very much want to continue the relationship between Norwalk and the cities represented here today and your subcommittee, so that we can provide input into this process that will have such a dynamic economic and air quality impact on our cities and on Southern California generally. This Interstate is a major link between Los Angeles and Orange County. Thank you very much for your time.

Mr. MINETA. Thank you very much, Mr. Mayor.

Chairman Anderson.

Mr. ANDERSON. Thank you, Mr. Chairman.

Mayor Vernola, improvements to Interstate route I-5 between State Route 91 and I-605 are eligible for interstate 4-R funds. Now in view of the bottleneck that would be created, if the I-5 link is not built through the cities of Norwalk, Santa Fe Springs, La Mirada, and Downey, has Caltrans proposed a schedule for improving the I-105 link?

Mr. VERNOLA. There is a schedule but it has not been adopted yet. The plans we have seen is for widening the freeway. And widening the freeway in that corridor would wipe out numerous homes and up to about 100 businesses along that route. Therefore, in our opinion it is not feasible to do that. That is why we need a federal

policy dictating alternative and innovative ideas to addressing the problem within our corridor.

Mr. ANDERSON. Well, under the Uniform Relocation Assistance Amendments, of 1987, persons and businesses displaced as a result of federal or federally assisted projects would have to be compensated for their losses. If the widening of the I-5 corridor resulted in the displacement of persons and businesses, they would have to be compensated for their losses. Do you have any estimate of how many people our businesses would be displaced or of the possible costs of relocating them?

Mr. VERNOLA. Being familiar with that area, I believe the cost to do that would far exceed the objectives of widening that freeway. You could obtain the same results by taking alternative modes of development and accomplishing the same thing without displacing the homes or the businesses. The figures I could not give you at this point.

As you are well aware, the Glenn Anderson freeway stops in the City of Norwalk and actually the amount of traffic that will be increased, not only on our surface streets at that stop at Studebaker, but also the increased traffic that will be coming on to the 605 and to the 5 from that freeway. And you are well aware of probably that area, the bottleneck that will be created will be a tremendous impact on our cities.

Mr. ANDERSON. I know all the way down I-5 whereever you go they always tell you this is the most important highway in the country almost, you know.

Mr. VERNOLA. That is right.

Mr. ANDERSON. That is the I-5 I am talking about.

Mr. VERNOLA. Yes sir.

Mr. ANDERSON. Thank you, Mr. Chairman.

Mr. MINETA. Mayor, in your testimony you indicate that creative and innovative multimodal approaches are needed to correct current transportation shortcomings. What kind of specific multimodal approaches are you looking at for that Interstate 5 link from State Route 91 to I-605?

Mr. VERNOLA. Well, you are well aware of Orange County's commuter rail system that Norwalk has just acquired a stop for. And we have linked up with the light rail system at I-105 with our bus system. So that will be in operation probably the same time the freeway gets opened up.

The freeway itself, the I-5 is being widened in the Orange County section and we are asking for a different approach, a federal policy to come up with a different approach. Instead of widening, maybe double-decking or as I indicated the high traffic lanes, reversible lanes on the freeway, those kind of things.

Mr. MINETA. Very well.

Mr. Packard.

Mr. PACKARD. That bring up a question, I think, Mr. Mayor. How do you propose to articulate the design of the expansion of I-5 as you move from one community to the other or as you move from Orange County into the section that we are talking about here. If each community or each area was able to kind of have a totally different concept or design to address congestion on I-5, how would that articulate as you move up from south to north or vice-versa?

Mr. VERNOLA. On the south end they have already started the widening, okay. They have not had to take any businesses out or homes out. They have widened right along the right of way of the freeway. As they come through Norwalk, Santa Fe Springs and Downey they will have to take out the roadways adjacent to the freeway, consequently eliminating the businesses along those routes and the homes. Up north the freeways have been widened already to a certain extent.

Mr. ANDERSON. But again, it really—I presume it would create some concerns and problems at least for the highway designers to move from a widened freeway to a double deck freeway then back to a wide freeway and so forth.

Mr. VERNOLA. I think that the engineers today can design and build just about anything you want to build and accommodate whatever you want to build. We have seen that happen so I feel very confident to give them that latitude, the Federal Government has given that latitude to Caltrans to work with the cities to develop those kind of alternatives, I think it can be done.

Mr. MINETA. Mr. Hastert.

Okay, Mr. Mayor, thank you very, very much for your testimony.

Mr. VERNOLA. Thank you very much for your time.

Mr. MINETA. At this time I would like to call on the Honorable Edmund G. Pat Brown, the very distinguished former governor of the State of California who was really a very, very, fine Governor who had a very fine Lieutenant Governor by the name of Glenn M. Anderson. So it is a real pleasure to have you here with us, Governor.

TESTIMONY OF EDMUND G. PAT BROWN, FORMER GOVERNOR OF CALIFORNIA, LOS ANGELES, CA

Mr. BROWN. Thank you very much. I agree with everything you say. [Laughter.]

Mr. ANDERSON. Mr. Chairman I go one step further than that. I say he is the greatest governor in the history of California. If you just remember the master plan for higher education, all the colleges, state colleges, universities, the water program from north to south, first the freeway system, the highway system.

One of my jobs was dedicating highways in those days, do you remember, Pat?

Mr. BROWN. I sure do.

Mr. ANDERSON. They were built under the Pat Brown administration.

Mr. PACKARD. Is that why so many——

Mr. ANDERSON. No, none of them were called——

Mr. MINETA. Not at that time, they are now—but——

Mr. ANDERSON. But having had the greatest governor at the time, we had the greatest lieutenant governor too, so——

Mr. BROWN. I agree with you very much——

Mr. ANDERSON. It is nice to have you here.

Mr. BROWN [continuing]. For your remarks, I really cannot understand how a man by the name of Ronald Reagan defeated me.

Chairman Mineta, Chairman Anderson and Members of the subcommittee. I am Edmund G. Pat Brown, the former governor of

California and a member of the board of directors of CRASH. CRASH in short is Citizens for Reliable and Safe Highways. I am here to voice my opposition to proposals that would allow Congress to authorize triple trailer trucks and twin 48 foot trucks.

It is a particular pleasure for me to appear with Chairman Anderson. He was my running mate and loyal associate during my eight years as governor of California. He was a great lieutenant governor and you all know what a fine Congressman he is.

One of Chairman Anderson's and I think my finest accomplishments while we governed California was to pioneer the California freeway system. I believe we provided our state not only with the best highway system in the nation, but also with the safest.

I worry, however, and that is the reason that I am here today that California's highway system is breaking down. Not only is the pavement itself deteriorating but the urban parts of our state seem to be approaching a gridlock.

Our highways are no longer reliable. We cannot rely on what should be a 20 minute trip taking 20 minutes. Frequently, what should be a 20 minute trip takes 40 minutes or even an hour. Sometimes this is because there are just too many cars and trucks on the road. Sometimes it is because of an auto accident. All too frequently, however, it is because a big truck overturned, like the double trailer tank truck that overturned last Thursday 10 miles from here on the Lakewood Boulevard on-ramp to the Artesia Freeway.

That double trailer tank truck crash spewed 700 gallons of diesel fuel onto the freeway and caused congestion all day long. I believe that double trailer trucks, like the one that overturned last Thursday, are unstable and unsafe. As a California Highway Patrol study demonstrated, double trailer tank trucks have a substantially high incidence of overturn than do single trailer tank trucks.

I do not pretend, however, to be an expert on truck safety, or even to read all of the complex and apparently conflicting studies on the subject. My conclusion that double trailer trucks are unsafe comes from conversations that I have had with a few experts on the subject.

If double trailer trucks with three articulation joints are unsafe, common sense tells me that triple trailer trucks one-third the size of a football field must even be more dangerous. The experts tell us the same thing.

The experts tell us that triple trailer trucks have five articulation joints and that the more articulation joints a vehicle has, the more dangerous the vehicle. The experts tell us that the third trailer of a triple trailer truck sways back and forth as much as four feet on a windless day on a straight freeway.

The experts tell us that the crack-the-whip effect which causes trucks to overturn is three and one-half times as great for triple trailer trucks as it is for single trailer trucks.

The experts give us many other reasons not to like triples and even more mammoth twin 48's. But I do not think that we need an expert to tell us that it takes much longer to pass a triple or twin 48 on dangerous two-way freeways. Nor do we need an expert to tell us that the freeway on and off ramps here in Long Beach were not designed to accommodate these monster trucks.

In my opinion, if Congress authorizes triples and twin 48's, there will be many more truck crashes than there are today. Many more lives will be lost. Many more will live the rest of their lives with injuries. And congestion will become radically worse as triples and twin 48's block traffic for miles.

Therefore, I urge you to adopt the goals of CRASH, Citizens for Reliable and Safe Highways, as your own. Let us work together to make our highways reliable and safe.

Thank you very much.

[Applause.]

Mr. MINETA. Chairman Anderson.

Mr. ANDERSON. Thank you, Mr. Chairman.

Governor Brown, what has been the safety record of twin 48's and triples in states were they are permitted to operate?

Mr. BROWN. I really cannot tell you what that is although it is my understanding in talking with an expert, and I cannot remember her name, in Chicago, she tells me that it is far greater in doubles and triples.

Mr. ANDERSON. Now fatal truck accidents have declined by 40 percent in the 1980's despite an increase in the number of trucks on the road. What is your opinion of the occasional view that is brought to us that allowing more capacity per truck, might further reduce the truck traffic and thus reduce fatal truck accidents? I would like to hear your answer to that.

Mr. BROWN. I really do not believe that it would. The trucks that we have on the freeways today are so massive that any enlargement would be dangerous to the driving public and to the truck owners themselves.

Mr. ANDERSON. Thank you very much, Governor.

Mr. BROWN. Thank you.

I would like to introduce my granddaughter, Patricia Kelly, San Francisco and she is with—what is your group that you are with?

Ms. KELLY. CRASH.

Mr. BROWN. She is with CRASH which I am representing today.

[Applause.]

Mr. MINETA. Governor Brown one of the things that we have been—oops—let me if I might before you run off—see if Congressman Packard had any questions. Let me, if I might, before you leave——

One of the things that we have been doing is trying to improve on is this whole issue of commercial driver licenses. And I am wondering if there is any interest in the support of the use, even limited use, of twin 48's and triples if additional strict operational and safety training requirements were placed on drivers. Whether or not, you know, triples or twin 48's should be allowed if there were stricter training requirements or driver licensing requirements, etcetera, being placed on drivers of those vehicles?

Mr. BROWN. When you think of those large trucks that you see on the road today and then you think of doubling it or even tripling it, no matter what training you give the driver there is an imperfection that we all have and these accidents are going to increase, and I just do not feel that it would be safe today to do it. We are going to have to do something about the freeways, you have heard testimony this afternoon and today about it. And it is a real

tough problem the doubling of the freeways is almost impossible. The cost is great and I think when we get down to it, we are going to have to move into mass transportation of various kinds rather than trying to find a solution in trucks.

Thank you very much.

Mr. MINETA. At this time I would like to now call on William E. Leonard, the Chairman of California Transportation Commission.

Mr. Leonard, your testimony is before us and it will be made a part of the record so if you would go ahead and introduce your colleague and proceed in your own fashion.

TESTIMONY OF WILLIAM E. LEONARD, CHAIRMAN, CALIFORNIA TRANSPORTATION COMMISSION, ACCOMPANIED BY BOB REIMAM, EXECUTIVE DIRECTOR, CALIFORNIA TRANSPORTATION COMMISSION

Mr. LEONARD. Thank you, Mr. Chairman. Appearing with me today is Bob Reiman, the Executive Director of the California Transportation Commission. I am Bill Leonard, Chairman of the California Transportation Commission and, Mr. Chairman, I thank you for permitting me to share with you some of the thoughts of myself and of my colleagues on the future of the federal/state relationship as you consider the Reauthorization of Post-Interstate Surface Transportation Programs.

In the interest of time, as you have already indicated, I have submitted my full testimony to you and today I will just, at this moment, just summarize those comments.

I must note though, that my appearance before you is much easier and delightful now that the California electorate has voted favorably for the passages of Proposition 108, 111 and 116 at the polls on June 5. And in so doing, may I point out they have expressed their support for a modern integrated multimodal transportation system.

The Commission's role in the development of transportation policy in California is one of establishing and organizing program priorities and allocating the resources to meet those priorities. This includes the allocation of available federal assistance to state transportation programs. California voters have accepted the state's responsibility for transportation improvements and I am pleased to report that 17 of our counties representing 74 percent of the state's citizens have also imposed additional taxes to augment state and federal revenues designed to enhance transportation infrastructure.

In evolving a new federal/state relationship in the post-interstate period, the Commission has adopted a set of principles it hopes will govern the relationship. In an effort to assist you in this committee's objectives, let me be specific.

First, the Commission recognizes that the new federal programs must be limited to recognizing a federal role which emphasizes the effective functioning of a limited national system that supports national defense, encourages economic development and improves interstate mobility.

Second, the new federal program must allow states to define the authority and responsibilities of each level of government within

the state and provide states the flexibility to determine their own transportation priorities when there is no overriding national priority. The Commission urges the Congress to grant to states with certified planning processes the flexibility to use federal highway and transit funds for the modal solution that best serves the needs of specific regions or communities within the states.

Third, the Commission is very troubled by the growing trend toward federally supported transportation demonstration projects. When federal funds are directed to constituents specific projects and a state or local match is required, these federal priorities tend to divert state and local resources from projects selected through the established state/local planning process. We recognize that demonstration projects have played a very, very important role under the present federal transportation programs because of the number of narrowly defined categorical programs. Under a flexible federal transportation program, we question the need of further demonstration projects.

Fourth, the post-interstate federal programs must eliminate duplication of engineering and environmental review efforts and excessive federal mandates. The Commission calls for increasing reliance on federal certification of state and local project approval procedures where those procedures are found to be reasonable surrogates for direct federal approval procedures. This is particularly true as the new concepts, the highway system of national significance and transit system of national significance emerges. The Commission believes that if there is truly to be a transit system of national significance its focus, particularly from the federal prospective, should be on interstate and interregional movement, and in particular on high speed rail, which makes sense only for interurban travel.

The voters emphatic endorsement of both rail transportation bond measures on the June 5th California primary election ballot is clear evidence of increased public awareness of the value of improving and expanding effective and feasible rail passenger service both in California and throughout the nation in order to promote interstate commerce and mobility and to enhance America's competitiveness in the Pacific Rim.

The Commission recommends that TSNS programs receive at least 50 percent of the federal funding available for transit so that adequate funds may be targeted to high speed rail deployment. In this connection, it is important that Congress consider allocating federal transit funding through the state so that state standards regarding the efficiency and effectiveness of rail transit and inner city rail service can be enforced.

Fifth, federal programs should not undercut the broad objective of neutralizing structural differences between programs and modes so that the best conceivable project solution can be funded rather than the one that happens to fill the available federal funding category. In short, the new post-interstate national concept for transportation must address transportation issues on the basis of an integrated multimodal system rather than as a group of competing modes, categories, projects, and jurisdictions.

Six, let me address a matter of increasing concern to the Commission and the ongoing negotiations between the Congress and the

Executive Branch concerning the federal budget deficit. The Commission believes that federally imposed transportation taxes and user fees must be preserved solely for transportation purposes. The federal highway trust fund should be taken out of calculations designed to mask the extent of the federal deficit. Californian's expect that federal transportation user fees will go to transportation and not to offset or retire deficits in the federal general fund. It is time to put highway and aeronautics trust funds to work for the purposes for which they were collected.

The new post-interstate program must guarantee the earliest possible release and availability for obligation of all federally imposed transportation excise taxes and fees to states and local entities and allow maximum flexibility with respect to the use of these transportation funds.

Seven, let me touch on one aspect the federal transportation policy that to date has received too little attention and I was so pleased to hear Governor Brown address this issue and that is the issue of the matter of overweight trucks.

The Federal Government has both a responsibility and a role to play in increased enforcement of truck weight fees and penalties for infractions of those limits. Continuing studies by California's department of transportation clearly demonstrate that overweight trucks damage public property and require higher levels of public investment for repair, thus competing for limited resources desperately needed for other transportation programs. And to underscore that I might point out that in a Caltrans study a legally loaded truck weighing 80,000 pounds does the damage to the highway system equivalent to 9,600 passenger cars. You overload that truck by 10 percent, another 8,000 pounds and you immediately create the damage of 50 percent more passenger vehicles up to 14,400.

The Federal Government has a proprietary interest in protecting its very substantial investment in the Interstate Highway System which has a total cost to date of $134 billion and has a current value of over one half a trillion dollars. The Federal Government is in position to ensure uniform enforcement of truck weight limits in all states.

Eighth and finally, I want to conclude with a special plea to you as congressional leaders in the transportation area to lend your support in the new era of post-interstate federal programming to ensure enhanced federal support for research and development. This need cannot be stressed too much. If this nation, as well as California, is to remain in the forefront of development of innovative transportation systems and mechanisms to reduce congestion and air pollution it is imperative that we must maintain if not increase our investment in research and development.

This commitment should include not only public sector R&D programs but also the considerable efforts being made in the private sector.

In summary, let me say we support program flexibility by the states in the use of federal transportation funds, reliance on the state and local project approval procedures, protection of user fees for the purposes for which they were collected and increased research and development.

Thank you very much for allowing me to share our views as to how California can best contribute to and fit in with the development of post-interstate federal transportation programs and policies.

Mr. MINETA. Thank you.

Mr. Anderson.

Mr. ANDERSON. Thank you, Mr. Chairman.

Mr. Leonard, the California Transportation Commission urges Congress to grant states with a certified planning process the flexibility to use highway and transit funds for modal solutions. Could you explain to the committee the certified planning process and describe which additives would be a part of this process?

Mr. LEONARD. Yes, Mr. Chairman, I would be pleased to.

As you know, as a national policy, the environmental procedures have been established under the NEPA Program. In California we have identical procedures under the CEQA program. We believe the CEQA program, the California Environmental Quality Act in all respects equals or exceeds the requirements of the National Environmental Protective Act. We believe that that represents not only duplication of money but a duplication of time which is extremely costly. We believe the publics purposes are best served with one study. We believe that if the flexibility were in the plan that the CEQA study would obviate the necessity of going through the National Environmental Project procedures also.

Mr. ANDERSON. The Commission has indicated that they are very troubled by federally supported transportation demonstration projects. Now how would providing greater flexibility for the use of federal funds reduce the need for demonstration projects?

Mr. LEONARD. Mr. Chairman, under Proposition 111, as you know, a part of that proposal was a congestion management plan are funds were available to the local entities and also to the state for that matter to propose and develop and construct that project that best suits the need regardless of what categorical area it might come in for financing purposes. As opposed to the present bill where you have financial categories that if it does not fit into that category than the job is not met.

In my own hometown area where we had a bad need at the Ontario airport, there was no category to take care of that. The only possible solution was a demonstration project.

Under the proposed Surface Transportation Act, following some of the objectives that we are suggesting to you, that need for a demonstration project would be obviated because at the state level and at the regional or county level it would be determined that that was the highest need and priority, and the funds would be able to be used for that purpose.

Mr. MINETA. Mr. Leonard, you are familiar with the program that the State Department of Transportation has come out with, has the Commission endorsed this Caltrans report?

Mr. LEONARD. Mr. Chairman, in response to your first question, yes, I am familiar with it. I have read it. I have not been briefed on it nor has the Commission. The Commission has——

Mr. MINETA. Did Caltrans consult with you as they were developing this or before they released the final report?

Mr. LEONARD. Mr. Chairman, in broad principle and conceptually the department did consult with us. In the final report the Commission was not a part of that product. But I must say though from a personal standpoint, and I am sure I speak for my Commissioners, we are supportive conceptually of the departments proposal. There are areas in there that we do have a difference of views and those differences where they do exist will be transmitted to the proper authorities within the state to pass on to Congress.

Mr. MINETA. The reason I asked, on page two you speak of highways of national significance which is something that the secretary of transportation issued in his March 8th National Transportation Policy and Strategy statement. But the Transit System of National Significance, TSNS, I believe is one that is only embodied in a Caltrans document. And from what I read of this, it seems to me we will be getting a reduced amount of funding to the state of California if we take the approach of TSNS because what it does is to peel off, as I recall, or it divides it into an 85/15 pot and then makes the 85 formula. And then by making that 85 percent formula part or making that 85 percent of the set aside by formula, then it would make less money coming to the State of California.

Mr. LEONARD. The Commission takes a different view than is embodied in that report and with your permission I am going to ask Mr. Reiman to respond specifically to your question.

Mr. REIMAN. The title is the same, the Transit System of National Significance, there are distinctions between what is referenced in that report and the Commission's view. I think conceptually the Commission believes that there is a very strong federal role and responsibility that is appropriate as well as the state role in inner city rail and particularly high speed rail. That emphasis and a greater share of the federal funding for transit going into to TSNS program than is suggested in that report is an example of the conceptual difference between what is discussed there.

Since the Commission really has not been involved in that report, it probably cannot speak to it in great detail but I think conceptually the Commissions view is that high speed rail development in California in particular, given the size of the state, is an extremely important component of mass transportation development and frankly one that individual jurisdictions or individual regions may not focus on to the extent that the Federal and state Governments could because of the nature of the inter-regional system. An inter-regional rail network would be a very healthy competitor to short haul air, commercial air development travel in the state as well.

Mr. MINETA. What I gather is that the Commission is also recommending that mass transit funds not go directly to operating agencies but that they go to the states and then get filtered down to operating agencies. I am wondering why would we want to be doing that?

Mr. REIMAN. The report that your referenced, actually, I think, suggests that operating funds that now currently go to rail operators directly would instead go to regional agencies, the Caltrans report that you referred to. The Commission's thought is that if that distribution of federal operating support is to be reconsidered,

the consideration of it coming to the state is a reasonable alternative to it coming to regional agencies.

Mr. ANDERSON. Fine.

Mr. Packard.

Mr. PACKARD. Than, in fact, the Commission is not recommending that mass transit operating capital come to the state and then pass through to the operating agencies?

Mr. REIMAN. The Commission is in support of that but I think it is in large measure in the context of reconsidering the current arrangement of it going directly to transit operators.

Mr. PACKARD. Have you got a feel from the transit operators how they would respond to such a policy?

Mr. REIMAN. Well, it is our understanding they are not too enamored with the notion of it going to regional agencies so since the question was on the table the Commission felt it should be part of the discussion.

Mr. MINETA. Congressman Hastert.

Mr. HASTERT. Thank you, Mr. Chairman. Just a short comment and a question.

I think probably one of the things that we do unanimously agree on is that trust funds need to flow out of that trust fund and back to the states or to the people at least that that money was collected from as a users fee.

And one of the things that the whole committee under the leadership of Chairman Anderson passed out last week, as a matter of fact, is the airport bill, airway bill that actually took those trust funds off budget in a much expedited fashion so one of the things maybe your testimony and others could lead to is something that we would look at seriously in this highway authorization to start to expedite the use of those trust funds and spend them out. And I agree with you that it ought to be done. It is something that we have not done for a number of years and certainly this country suffers from it.

TESTIMONY OF GEORGE M. MEDAK, CHAIRMAN, BOARD OF DIRECTORS, LONG BEACH TRANSIT, ACCOMPANIED BY LAURENCE W. JACKSON, PRESIDENT AND GENERAL MANAGER, LONG BEACH TRANSIT; NICK PATSAOURAS, BOARD PRESIDENT, SOUTHERN CALIFORNIA RAPID TRANSIT DISTRICT; DAVID ASHCRAFT, TRANSPORTATON DIRECTOR, CULVER CITY MUNICIPAL BUS LINES, CULVER CITY, CA; ALAN F. PEGG, GENERAL MANAGER, SOUTHERN CALIFORNIA RAPID TRANSIT DISTRICT

Mr. LEONARD. We hope that action that you have taken is a foot in the door for the highway fund, yes sir.

Mr. HASTERT. We will find out.

Thank you, Mr. Chairman.

Mr. MINETA. Thank you very much, Mr. Chairman and Mr. Reiman, for being with us.

Mr. LEONARD. Thank you Mr. Chairman.

Mr. MINETA. At this time I would like to call forward Laurence W. Jackson, President and General Manager of the Long Beach Public Transportation Company, Alan F. Pegg, General Manager of Southern California Rapid Transit District and David R. Ashcraft,

Transportation Director, Culver City Municipal Bus Lines to come to the panel to sit at the table and to make their presentation.

I would like to call forward George Medak the Chair of the Long Beach Transit to be followed by Nick Patsaouras Chair of the Southern California Rapid Transit district. And they will be making their presentation from the podium so if Mr. Medak——

Mr. MEDAK. Mr. Chairman, thank you.

Mr. MINETA. You may proceed.

Mr. MEDAK. Thank you, Mr. Chairman and Members of the committee. Thank you for coming to Long Beach today.

Let me give you a little bit of background about Long Beach Transit. We are a medium sized operator. We run about 200 buses and we transport about 20 million people annually.

Since the inception of Federal subsidies for public transportation, 15 years ago, we have doubled in size. We have been required to double in size as you can see as you drove in today from any direction. The downtown area is growing.

We have added a little over a million square feet of commercial office space in the last year and a half. In the next five or six years it is anticipated that we will add another 2.5 to 3 million square feet of commercial office space. We will double the size of retail space.

As you can also see from just outside the building, the light rail line will be beginning its run from Los Angeles in 12 days. We are very excited about that. We are excited about interfacing with it. That too is going to bring some people, hopefully, take some work traffic. But we think and our transportation planners and community planners believe that in the next 10 years, downtown employment will double and in the next 20 years, employment and transportation required will increase 170 percent.

We can not do that without continuing subsidies as provided for in the legislation that you are reviewing.

We are also concerned about clean air. It is a national concern and particularly a concern in the Long Beach and Los Angeles area. We have problems in this area that we need to solve. One of the solutions obviously is going to mass transit and not taking single or vehicular trips all the time. We hope that the House version of the bill, one that supports mandates and supports timing will be passed. We hate to see retrofitted types of solutions that cost a lot of money. We hate to see technology that perhaps is not ready yet demanded. The cost of that can seriously impact the amounts of monies that we have to provide transit and transportation.

We will continue to move with clean air. We hope that there is some logic in what occurs.

With respect to the Americans with Disabilities, Long Beach Transit has been running paratransit services for more than 10 years. With the next purchase of our buses, our entire fleet will be equipped to handle wheelchairs. They will all be lift equipped busses. We are proud of that record. We continue to stay at the top of that game if we can and we would like to stay there. We are concerned about the expansion of the disabled—perhaps economically disabled or developmentally disabled are not necessarily transportation disabled people. If we are required to expand that

paratransit service our estimates are as high as one third of our operating subsidies may have to be placed into that area. So it is a give a take. If we increase the paratransit we are going to have some difficulty maintaining the service that we have and the service that we have needs to be increased.

We have prepared statements that you have, and in the interest of time and your interest we would like you to read those at your leisure. As you know I am here with Larry Jackson who can answer questions on our behalf and I hope I can answer some as well.

We trust that the committee will consider the concerns about the clean air mandates and about the disabled Americans when they consider passing the legislation that will provide additional subsidies.

I thank you for your time and thank you for your attention.

Now that Chairman Anderson is back, one of the contributing factors to the boon downtown is that Glenn M. Anderson Federal Building. It is a gorgeous building and that should be occupied by the end of the year.

Thanks, Glenn, thank you very much.

Mr. ANDERSON. I am ready to move in.

Mr. MINETA. With the transportation being supported by the fund—or being provided by the Glenn M. Anderson Transit Corridor.

Mr. MEDAK. That is right.

Mr. MINETA. Let me call on our very fine friend, Nick Patsaouras, President of the Board of Southern California Rapid Transit.

Mr. PATSAOURAS. Thank you. Chairman Anderson, Chairman Medak, Members of the subcommittee, I want to thank you for this opportunity to present the Southern California Rapid Transit District's views on reauthorization of the Surface Transportation Assistance Act and, particularly, for coming to Los Angeles to see, first hand, the transportation needs of our metropolitan area.

We at the SCRTD are proud of the progress we have made in meeting these needs. We realize that there is much that remains to be done if our region is to meet the transportation challenges of the 1990s and into the next century.

The Southern California region is currently faced with tremendous unmet demands for transit service, as well as future demands that are staggering. California voters recently indicated their support for transportation by passing a comprehensive financing package which included funds for streets and roads, rail transit and other demand management improvements. However, the revenues created do not address the overwhelming need for rail and bus operating funds, as well as the additional capital funding that will be needed to expand the bus fleet.

I will briefly review the factors that are generating the tremendous current and future demand for transit in the region. These demands include:

Population growth and a flourishing economy that continues to increase congestion in the area;

The imposition of stringent Clean Air requirements;

An increasing emphasis by employers to encourage employees to utilize mass transit;

A growing elderly population that tends to be more transit-dependent;

And finally the mainstreaming of a growing number of disabled persons, who are increasingly relying on public transit.

The Southern California region is currently the most underserved transit market in the country. SCRTD ridership is third highest in the country, right behind Chicago. I would like to refer the Members to the attached tables A and B. They clearly demonstrate transit's vital role in an area where the car is the king. RTD buses work longer and harder than any other American city. The addition of light rail in just a few weeks will further assist in meeting Los Angeles County's transportation needs.

In Los Angeles, our local Air Quality Management District has imposed sweeping air quality reforms, in conformance with EPA requirements. These measures increase the transit mode split for workers in Los Angeles Country from 9 percent to 25 percent by the year 2010. In order to meet this requirement, transit services will need to be tripled. We estimate that about two-thirds of the additional service will be provided by bus transit, presuming construction of all rail lines planned for implementation by 2010. This will require an increase in the active bus fleet from nearly 2000 buses to almost 5000 buses. Based upon these requirements, the total unfunded operating and capital needs over the next 20 years is an estimated $11.2 billion for RTD's service area.

Further, Congress is poised to enact within the next few weeks legislation that will materially add to the burdens and responsibilities of transit districts throughout the nation. We speak of the Clean Air Act, now in conference between the Senate and the House, and the Americans With Disabilities Act which may soon find its way to the President's desk.

The RTD is committed to meeting these new responsibilities. We are in the forefront of those transit districts that are testing alternatively fueled vehicles. The District is currently testing over 40 alternative fueled vehicles including the largest, methanol, and compressed natural gas fleets in the nation. By the end of this year, we will be testing over 60 clean fuel vehicles. Currently, over 90 percent of the District's fleet of 2300 vehicles is lift-equipped. We will be 100 percent lift equipped by 1994.

Recently, RTD representatives met with top UMTA officials to explore the concept of expanding the existing federal transit program to address the funding requirements of these two major pieces of legislation. UMTA supported the District's efforts to canvass other large metropolitan transit districts to determine the impact of this legislation on their properties.

The RTD convened a meeting in Washington with eight of the largest transit districts in the nation. We shared with our colleagues the cost figures accumulated by the RTD in meeting the strictures of the California clean air requirements which, in large measure, coincide with those that will most likely emerge from the House-Senate conference.

We have asked transit districts to compile similar statistics that will reflect their projected costs in meeting clean air requirements

so that you will have a fair estimate as to those incremental costs. As you know, there is precedent for the principle of having the Federal Government assist in meeting environmental costs mandated by federal law. One need look no further than the Clean Water Act which has made some $55 billion in construction grants to state and local entities since 1972.

You should be aware too, Mr. Chairman, as you continue your hearings throughout the country, that transit districts will be compiling their projected costs of meeting those capital and operating requirements anticipated by the passage of the Americans with Disabilities Act.

Overall, we cannot overemphasize the importance of Section 9 operating funds and Section 3 capital funds. As you are well aware, the Administration is proposing drastic cuts in these vital programs. These proposed Section 9 cuts would amount to a $1 billion shortfall for RTD over the next 20 years. Currently, RTD receives about $41 million or 7 percent of annual operating assistance from Section 9. Loss of these funds would translate into 23 percent fare increase or a 10 percent service reduction.

I respectfully request the committee to consider the following, when deliberating on the reauthorization:

Maintain current capital and operating assistance programs;

Consider a specific line item to fund the incremental cost associated with implementing the provisions of the Clean Air and Americans With Disabilities Acts;

Consider recommending a 7-cent federal gas tax increase for transit purposes;

And finally, mandate the expenditure of the $3.9 billion in unobligated balance that currently exist in the Transit Account of the Highway Trust Fund.

Mr. Chairman, facing these demands head-on is critical to the economic vitality and competitiveness of this country, just as the need for highways was critical to the nation's growth and vitality in the 1950's and the 1960's.

We applaud you, Chairman Anderson, Chairman Mineta, and other Members of the committee for your dedication to improving the mobility of our great country. Through a cooperative federal, state, local and private partnership we can meet the present and future needs of our economically vital and dynamic nation.

Thank you.

Mr. MINETA. Thank you very much.

Mr. Chairman at this time I would like to call on David Ashcraft, the Transportation Director for the Culver City Municipal Bus Lines to make his presentation.

Mr. ASHCRAFT. Thank you, Mr. Chairman, distinguished Members of the subcommittee, my name is David Ashcraft, Transportation Director of the Culver City Municipal Bus Lines in Culver City, California. It is indeed a privilege for me to appear before you on this important subject of Reauthorization of the Post-Interstate Surface Transportation Programs.

I am here to speak to you as the manager of a small transit system operating within a large urbanized area. Culver City Municipal Bus Lines, known as Culver City Bus now, is one of 13 municipal transit systems within Los Angeles County providing efficient

and effective bus service that complements the regional transit operator, SCRTD.

The City of Culver City began operating its own municipal bus system in March of 1928. Next to San Francisco Muni railway, it is the oldest continuously operating municipal bus system in the state of California. Our City Council considers Culver City Bus a vital service to the residents and businesses in and around Culver City.

Today, our system is made up of a total fleet of 28 busses and we operate over six routes. Our service area includes Culver City and the communities of Westchester, Marina del Rey, Palms, Rancho Park, Venice, Mar Vista, Westwood and West Los Angeles. Our service area is 25 square miles and serves a population of about 191,000 people. It runs from Los Angeles International Airport on the south to UCLA on the north and from the eastern edge of Culver City on the east to Venice Beach on the west.

Ridership continues to grow on Culver City Bus routes. During Fiscal Year 1990, the one we just finished this past weekend, over 3.8 million riders, which is an all time record, rode our buses. This is a 10 percent increase over last year and a 35 percent increase above just five years ago. Our buses traveled 900,000 miles and we provided 81,000 hours of service.

This ridership and the hours of service provided calculates out to 47 passengers per every hour of service that we were in operation in Fiscal Year 1990.

The ridership increase experienced by Culver City Bus is not unique. There are 12 other municipal transit systems operating within the Los Angeles Country who are also experiencing increased ridership. These increases can be partially attributed to area development, traffic congestion, and air quality concerns.

However, in my opinion, just this last year, a major contributor to the ridership increases in the Southern California Air Quality Management District's Regulation 15. You have heard before that this regulation requires all employers in the los Angeles Basin with more than 100 employees to develop and implement a trip reduction plan. The goal of Regulation 15 is to meet the federal requirements of the Clean Air Act.

Increased ridership is the goal of every transit system in the United States, both large and small. I do not know of any system that does not try to increase its ridership every year. However, in our case, with success comes additional financial burdens. Culver City Bus is reaching a point where ridership will soon exceed capacity, especially at peak times. To meet the need, additional capital and operating assistance will be necessary. Although the state of California and Los Angeles County contribute substantial funds for transit services, there is still the necessity for increased transit funding from the Federal Government.

In addition to these increased ridership demands, the regulatory requirements contained in the recent passage of the 1990 Clean Air Act and the Americans for Disabilities Act, will have an increased financial impact on all transit systems which will be considerable. Again, without Federal financial operating and capital assistance, transit systems will be unable to meet mobility needs of the public and federal mandates.

I urge you and your colleagues in the Congress, as well as the Administration, to pass into law and again reauthorize the Surface Transportation Act and its various programs at levels which will enable our transit systems to meet the ever increasing demand for public transit in the years to come.

I know one proposal that is being put forth is to eliminate operating assistance into large urbanized areas. I must say that without operating assistance the municipal systems operating within Los Angeles County would find it extremely difficult to continue operating at the same level and provide the same efficient effective service that we are providing today.

I want to thank you for this opportunity to express my concerns and views and would be happy to answer questions at the appropriate time. Thank you Mr. Chairman.

Mr. MINETA. Thank you very much, Mr. Ashcraft.

Chairman Anderson.

Mr. ANDERSON. Thank you.

All the members of the panel have asked that we provide a specific funding authorization for the costs associated with implementing the pending amendments to the Federal Clean Air Act and the Americans With Disabilities Act. However, the capital and operating costs for transit agencies of complying with both these measures are already eligible for federal funding under the 1987 Surface Transportation Assistance Act. Now given this, is not the issue actually one of providing a sufficient level of funding for all transit operations and capital improvements from which projects related to the ADA and the clean air mandates can be funded rather than creating a new specialized funding program category or set aside.

Mr. ASHCRAFT. Chairman Anderson, I believe that the current level of funding just barely helps us meet the requirements that we have today and in my opinion the additional burden that the 1990 Clean Air Act, and I am going to say the Alternative Fuel Mandates and so forth, with—and also the ADA mandates of—making sure that those with disabilities have the same opportunities to ride transit as those today, creates an additional burden on transit systems.

Mr. MINETA. Mr. Jackson.

Mr. JACKSON. I am not sure if I understood completely your question Mr. Anderson. But my perspective is the reauthorization has adequate funds and it does not mean money at existing levels, we need more money to deal with the operating situation in the future. But if there is adequate funding in general in the bill, from my point of view we do not need to have specific earmarks for those programs. But if there is not additional, if there—as the administration proposes a continuing cutback in those funds then we have got a major problem to contend with since we have to balance our budgets. To me it is as simple as that.

Mr. ANDERSON. I think we should provide enough for the whole operation instead of setting up a new specific project——

Mr. MINETA. Mr. Chairman, would you yield on that point?

Mr. ANDERSON. Sure.

Mr. MINETA. The point of our problem is not that the authorizing level is high enough. It is a fact that we are not getting enough out of the Appropriations Committee even though our authorizing leg-

38-253 O—91——66

islation has sufficient funds for capital improvement and for operating assistance. It is just that we are getting short changed.

Mr. PEGG. I would note, Mr. Chairman that these programs impose significant incremental costs over and above those that we experienced today. Certainly, the issue of a new program versus adequate funding is one which belongs in your hands. But there is a significant cost here at a time when these programs are experiencing cutbacks and it is that additional cost that we need to speak to you about.

Mr. MINETA. If the Chairman would yield, what kind of incremental costs does that impose upon you? Can you give me an example of something——

Mr. PEGG. Yes, sir, we are in the process of implementing a substantial fuels testing program. We would estimate the cost of reequipping the existing RTD fleet in a range from $48 million for clean diesel to $175 million for compressed natural gas. That does not provide for service expansion; that does not provide for any change in the basic character of our service.

Mr. MINETA. But in the absence of, let us say, our even having passed the Clean Air Act, is that something that the Southern California Air Management District, what is it down here—the South Coast Air Quality Management District would have imposed on you in any event? Reg 15, is it?

Mr. PEGG. The regulations in California are more stringent than in many places in the country and in the absence of a federal mandate, which the Air Quality Management District rules will implement, it is reasonable to believe that there would have been some separate rulemaking.

Mr. MINETA. Thank you.

Mr. Chairman?

Mr. ANDERSON. Mr. Ashcraft, in your testimony you mentioned the Southern California Air Quality Management Districts Regulation 15, which requires that employers develop and implement trip reduction plans. Does the city of Culver City, as a transit operator, get involved with private business in developing these plans?

Mr. ASHCRAFT. Yes, sir, we do.

Mr. ANDERSON. You do.

Mr. ASHCRAFT. We offer ourselves as a resource to the private employers in our community to help them develop their plans and also tell them how they can effectively implement their plans and I have a staff person that meets on a regular basis with several employers within Culver City.

Mr. ANDERSON. Is the Los Angeles County Transportation Commission involved and is the Metropolitan Planning organization, the Southern California Association of Governments, are they also involved like you are?

Mr. ASHCRAFT. To my knowledge, they are, sir.

Mr. ANDERSON. Thank you.

Mr. MINETA. As all of you know, the President in this Fiscal Year 1991 budget eliminated the Federal Operating Assistance to transit districts in metropolitan areas in excess of one million population. I would like to ask the members of the panel to comment as to how much their fares would have had to increase if that was

a necessity or how many riders might be lost as a result of such a fare increase.

Now this information may not be readily available to you at this point, but I would appreciate it if you could maybe submit that for the record. I would also like to find out from the three operating districts right now as to what percentage of their operating budget comes from the federal coffers.

Mr. Ashcraft.

Mr. ASHCRAFT. From my budget, approximately 10 percent of my operating budget is a federally allocated share. Thirty-eight percent comes from the fare box and local contributions, 26 percent from the state TDA Act and 26 percent from Prop A discretionary funds throughout the county.

[Subsequent to the hearing, the following was received from Mr. Ashcraft:]

CITY OF CULVER CITY
9770 CULVER BOULEVARD • P.O. BOX 507
CULVER CITY, CALIFORNIA 90230-0507

August 8, 1990

The Honorable Glenn M. Anderson
Chairman
Committee On Public Works And Transportation
2415 Rayburn House Office Building
Washington, DC 20515

RE: Testimony Before Subcommittee on Surface Transportation

Dear Chairman Anderson:

Chairman Norm Mineta asked how much fares would have to increase and how many riders might be lost as a result of such fare increase if federal operating assistance would be eliminated to metropolitan areas with a population in excess of one million.

Culver City Municipal Bus Lines would have to raise our base fare from 50 cents to 75 cents in order to make up for the loss of federal operating assistance funds. This would result in a loss of ridership of over one-half million passengers from a base of 3.8 million. This information should be inserted on Page 205, line 4669 of the transcript.

Again, I want to thank you and your colleagues on the Subcommittee for the opportunity to present my views and comments on this very important subject.

If I can provide any further information to you, please do not hesitate to contact me at any time. I can be reached at (213) 202-5712.

Sincerely,

CULVER CITY MUNICIPAL BUS LINES

David R. Ashcraft
Transportation Director

cc: The Honorable Norman Mineta
Editor, Committee on Public Works & Transportation

Mr. ASHCRAFT. I think Mr. Pegg may have some information on what the fare increase might be.

Mr. MINETA. Mr. Pegg.

Mr. PEGG. We see 7 percent of our budget coming from federal operating funding at this point, and estimate that if it were to be removed we would require a 25-cent fare increase in order to replace those funds. I would note that our base fare today is a $1.10 and therefore a 25-cent increase is about a 22 percent increase on the fare.

Typically, in replacing lost funds we find a disproportional effect on the fares from this kind of funding cut. We would estimate that if in the alternative we were to make service adjustments with regard to this item, we would probably lose in the neighborhood of 60 million rides per year on a base of about 440 million.

Mr. MINETA. Twenty million? I am sorry I——

Mr. PEGG. Sixty million rides would ultimately be displaced on a base of about 440 million.

Mr. MINETA. Mr. Jackson.

Mr. JACKSON. Chairman Mineta, our base fare would either have to go from about 60-cents today to over $1 to offset the federal loss, the federal funding is approximately 10 percent of our operating budget and if we did not offset that with the fare increase, as was the case with the SCRTD, we would experience significant ridership loss. I would estimate in the area of about 3 million rides would be lost in Long Beach on a base of about 22 million passengers served per year.

So as you can see from all three of us, although the percentage has been declining in recent years of federal funding, the elimination of federal funding would either cut the heart out of our operation or would cause us to raise fares to the point that it would make it very difficult for many people to be able to ride the service.

Mr. MINETA. Mr. Patsaouras, if I might ask as you know right now the federal gasoline tax is nine cents of which a penny goes to the mass transit account. You are asking us for—actually it is the Ways and Means Committee that is the tax writing committee, one that we like to refer to as the Ways to be Mean Committee, that you are asking for a seven cent increase of the federal gas tax for transit purposes. I am wondering to what extent, even if that kind of an increase were enacted what guarantees do we have that monies would be spent and not just left to be accumulated in the mass transit account of the Highway Trust Fund the demography of the White House.

Mr. MINETA. Mr. Packard.

Mr. PACKARD. No comment, Mr. Chairman, no questions.

Mr. MINETA. Any questions—Mr. Hastert.

Mr. HASTERT. I might just comment if I may. Mr. Pegg was back in my office in Washington just a few days ago and left a packet and we reviewed that and I appreciate that and think we understand basically——

Mr. MINETA. Mr. Hastert, while you are at the microphone, let me just go ahead and ask you another question. At the national level, there has been much discussion about increasing private sector development or private sector involvement in the funding of

the transportation infrastructure and I am wondering, I am especially interested to hear what Mr. Patsaouras has to say given the SCRTD's experience in this regard and the financing of LA metro rail, and I would like to hear what other panelists might have as suggestions as to what we might do to encourage private sector involvement in transportation funding.

Mr. PATSAOURAS. I am very proud to say that, as always, RTD is a leader and trendsetter in new ideas, innovative ideas. Within a month the RTD is going to complete negotiations for multi-million dollar joint development. We are negotiating seven sites along the metro rail to provide joint development opportunities not only for the construction but also for the operation of the system. So I am a strong believer that there has to be a public/private partnership and not only are the joint development opportunities but the key factor in the federal funding agreement with the Federal Government was the benefit assessment, be as it may is contested at this point, but again it was innovative method to provide financing for transit systems.

Mr. MINETA. The transit agencies here in Southern California have probably been in the forefront of any kind of technology dealing with the connection between clean air and transit and, Mr. Pegg, I would like to have you, if you would, comment on—you mentioned a little while ago about going to clean diesel. Now is that a technology that you have worked on with the manufacturers of the engines, is that something that you have done in-house? And also I would like to have you explain table C of the RTD testimony.

Mr. PEGG. Certainly. Clean diesel is currently augmented with a device called a particulate trap. There are at least three manufacturers currently in this country. The device is one which traps particulate matter from diesel exhaust on a ceramic filter or ceramic fabric filter and then burns it off with a secondary heating element.

As a result when you look at the operation of the exhaust system you cannot see emissions from a bus so equipped. We are currently working with at least two manufacturers testing their products. This has been, to date, successful. I think it is an important technology for the conversion of the fleet, particularly in the interim period, as the clean air regulations take more and more strong effect. You asked for——

Mr. MINETA. As I recall the Clean Air Act talks about alternative fuels for what—1997?

Mr. PEGG. Yes. The Clean Air Act has a phase-in which clean diesel solutions, in at least one version of the act, are allowed and then there are increasingly stringent controls leading up to alternate fuels in later years.

Mr. MINETA. From my conversations with Detroit Diesel Cummings and Caterpillar, they are not that sanguine about being able to make that 1997 date on—with alternative fuels. They are on clean diesel because that is where their research and development has been. So what do we do if the 1997 mandate comes along and there are no alternative fueled engines?

Mr. PEGG. Well I am proud to be able to say that the RTD has been a leader in this area. We do have a fleet of 30 methanol busses currently that we are testing. I have regularly stated that

this is new technology. It is technology that we have some difficulty in making operate but as we continue with our trials, we are getting improved performance from this demonstration. It certainly will require additional work than I see with the current diesel bus but we are proceeding with the trial and we are having many successes with it.

Mr. MINETA. Let me ask about methanol. In terms of its toxicity as a fuel. Is it not or is it ethanol I am getting it confused with?

Mr. PEGG. Methanol is clearly a substance which we take additional efforts to control the fueling system——

Mr. MINETA. Do you color it, what do you do, I mean—is it not colorless, is it not one in which flames are hard to see if it is on fire, is this not, you know, as I recall just a couple of weeks ago when the Detroit races were on, there was a methanol fire. The driver was on fire. There were people in the pit on fire. You could not see the flames and yet they were dousing each other with water and the driver was beating himself like this and I am just wondering whether or not this is really, you know, I mean these are highly trained technicians in the pit in the races there, working on that stuff. This is not a controlled environment in which these busses are going to be operating and I just really have some real concerns about this. But you have no safety fears about that——

Mr. PEGG. Yours is a very real concern, Mr. Chairman. We have done several things in order to control the safety of this substance. The fire fighting characteristics for instance of diesel fuel are such that it is often difficult to put out a diesel fire simply with water. It is very easy to spread the fuel, whereas with methanol we actually have the ability to dilute methanol in order to put out a fire.

However, we also take additional safety precautions. We equip our entire methanol fleet with a fire fighting system in the engine. We have on one occasion had the system trigger. It was very effective in putting out the fire. So all fuels are risky substances with regard to fire and the fire fighting characteristics of methanol are different than they are for diesel fuel. I do not believe it is exclusively true to represent methanol as being worse, I think it is extremely important that we work with local fire departments to train them in fire fighting characteristics.

Mr. MINETA. If you could turn to Table C and explain that to me.

Mr. PEGG. Basically, Table C makes a comparison of a standard diesel equipped bus such as we run today with a clean diesel vehicle with a particulate trap with a compressed natural gas vehicle and with methanol. You will note that accompanying the table are an extensive list of footnotes. The footnotes are necessary because the characteristics of this table will vary substantially from property to property. For instance, somebody in Chicago where there is freezing weather and inclement weather will put their fueling facility indoors and will experience different costs and different problems than we do here in southern California.

What the table shows is that, for instance with regard to fuel facilities, there is an incremental cost with regard to compressed natural gas of $2.5 million per facility. It requires extremely powerful compressors in order to fuel the bus in the time cycle that allows us to meet the fueling requirements for the entire fleet overnight.

Similarly there is a much smaller increment with regard to methanol; the increment here in southern California is only 15 percent. Moving on down the table to passenger loading, all of the advanced fuel technologies reduce the—we have translated it into a reduced carrying load for the bus but basically if you look at the last line, "bus weight," passenger loading for clean diesel would be three less than with the base diesel bus. This is because of the additional weight factors.

Moving on down the chart, fuel costs, there are incremental costs, from a base of 17 cents for diesel, 17 cents per mile. Increasing for a clean diesel and the most expensive is methanol with a 37-cents per mile cost in our trials.

Again, looking down to maintenance. Specific maintenance items, brakes and tires, we see increased costs significantly because of the greater weights of the vehicles with regard to brakes and tires, but we also see increased maintenance because the technology is new and it is experience that we have yet to gain.

The initial cost of the vehicle today, a lift equipped bus in southern California costs about $190,000. CNG, the most expensive technology would be about $245,000.

Then moving on down, durability, we see that each of these technologies would be expected to be less durable in its earlier years than diesel. Looking on the right hand side of the line you see the same data presented for converting the bus fleet. Conversion is an extremely important issue because it allows us to get the benefits of clean air technology quickly rather than waiting for the entire 12-year cycle of converting the existing bus fleet.

Mr. MINETA. Very well.

Mr. ANDERSON. Mr. Chairman.

Mr. MINETA. Chairman Anderson.

Mr. ANDERSON. Mr. Pegg, about a year ago, maybe a little more than that, the city of Los Angeles, had three I believe it was, methanol burning buses that they brought into their fleet and I was out when they did that and I have been told that those have been operating pretty good. Cheaper and safer and everything. Now what I get from you it is just the opposite of that.

Mr. PEGG. Well I would not want to say to you that they were operating exclusively better. Certainly the customer reaction on the street, the reaction of the patron driving the car to those methanol vehicles, it is highly positive.

Mr. ANDERSON. Can you recognize it, can you tell it?

Mr. PEGG. You can absolutely tell it if you are driving behind a methanol vehicle there is no visible exhaust, and there is no odor of fuel.

Mr. ANDERSON. That is good, I would think that would be good.

Mr. PEGG. That is absolutely the benefit.

Mr. ANDERSON. For clean air. I have not heard that there was any danger of them and I heard it was also fairly reasonable as far as the costs are concerned.

Mr. PEGG. Well, clearly the costs are higher. I wish I could say that methanol technology was as cost efficient as diesel. Today it is not. I would also have to note that today methanol is supplied to us largely as a chemical grade substance and as we manufacture it in quantity for fuel one would expect the cost to come down. So I

think there still is a great deal of knowledge to be gained here about what the costs and performance of these new fuels are.

Mr. MINETA. Any further questions?

[No response.]

If not I would like to thank Mr. Medak, Mr. Patsaouras, and Mr. Jackson, Mr. Pegg and Mr. Ashcraft for lending us their operating knowledge. Thank you very, very much.

At this time I would like to call forward Neil Peterson, Chair of the Strategic Planning Subcommittee of the Legislative Committee of the American Public Transit Association and the person who is the executive director right here of the Los Angeles County transportation commission. Mr. Peterson, if you would go ahead and proceed in your own fashion, sir.

TESTIMONY OF NEIL PETERSON, CHAIRMAN, STRATEGIC PLANNING SUBCOMMITTEE, LEGISLATIVE COMMITTEE, AMERICAN PUBLIC TRANSIT ASSOCIATION, LOS ANGELES, CA

Mr. PETERSON. Thank you very much, Mr. Chairman, Chairman Anderson, Chairman Mineta and Members of the committee. It is a pleasure to speak before you today and I will be speaking today in my role as the Chairman of the Strategic Planning Committee of the American Public Transit Association which is the association charged with looking at the same questions you will be facing in the months ahead, how should this reauthorization bill be structured for the future?

Chairman Mineta has said many times that there is a real opportunity here to chart a new direction and if you think about where we are as a nation, we have a Clean Air Act, with clean air goals, we have a Clean Water Act with clean water goals but we do not have a National Transportation Policy with National Transportation goals. And you, as a committee, have an opportunity to set that forward this year. We are the one country in the western industrialized world that does not have such a policy.

What are the national interests and what are the federal roles? To me I think it is worth taking a little bit of time to review what they are.

Number one, we may be moving from the cold war to something else, but what we are moving to is an economic war. And so our productivity and our ability to be able to compete is vitally important. And those of us that live in the Pacific Rim here perhaps feel it more keenly than other parts of the country, but in Los Angeles alone the time we spent in congestion as opposed to being in our work place and doing something productive, cost us over $507 million in productivity this past year.

I can assure you with many of the trips and business dealings we have had with Japan, for example, that they are vitally concerned about our ability to be mobile in the Los Angeles area because they realize that we are a major trading partner with them so our ability to compete in that world of economic environment is a key national interest.

Secondly, clean air. You have heard from the speakers earlier. At least half of our air pollution here in Los Angeles and around the country is from mobile sources. Obviously to the extent that we

can do something about and we are helping with that national objective.

Accessibility, we are very involved with the ADA act. Or ability to give to all Americans regardless of disability, the ability to move around and this will become even more important in the years ahead as the demographics or our population change.

Fourth, the reliance on foreign oil. I can remember very well the late seventies and the gas crisis, President Carter's energy independence proposal. Today we are importing more oil as a percentage of our total demand than we were during the years of the Carter administration.

And finally, mobility. We all talk about freedom of the automobile and freedom to move around. I would at least suggest to you that it is one thing being able to get in your automobile and get out on the road and it is another thing to be able to move once you get out on that road. And we are actually reaching a stage here in Los Angeles County where that freedom is being jeopardized and we need to deal with that issue in order to be able to allow people to continue to have that freedom of mobility.

How are we doing against these national goals? I think we are doing poorly, frankly. We are facing a crisis here in our area. We made a report the other day on the six most congested corridors in Los Angeles County. The Santa Monica Freeway going east, from the Santa Monica area through West LA, through downtown and out on the San Bernardino freeway out to Pomona. That is the most congested corridor in our area. It is the most heavily trafficked freeway in the country.

How do we identify our most congested corridors? That corridor and several others have an average speed of less than 35 miles an hours for more than six hours a day. Chairman Anderson is very interested in the Harbor Freeway. That freeway has an average speed of less than 35 miles an hour for over 11 hours a day. Our average speed today is going to drop in half to down to 17 miles per hour within the next 10 years unless something dramatic is done.

Another interesting way of evaluating how we are doing as a nation in meeting these goals is to look at mode splits. In this country, 3.4 percent of the people take something other than their own automobile to work. In Canada it is 15 percent of the people using public transportation in their daily lives. In Great Britain it is 19 percent and in Sweden it is 11 percent. We stand in stark contrast to the other industrialized countries of the world in terms of the number of people who can, in fact, take alternative modes of transportation so that we can all move around better.

What do we need to do about it? Your committee is faced with a process of dealing with a variety of different interests and I have some empathy for that because I have been in the same process as Chairman of this committee in dealing with the various groups and interested or associated with the APTA. Large properties, small properties, urban properties, rural properties, eastern versus the west, sunbelt versus old, remodeled versus new and expansion. These kinds of issues are present in our association and it is not easy to pull together a coalition that brings everybody together and moving forward. But there are some conclusions that do come forth

and I would like to just highlight a couple of these as I am diverting from my prepared text here.

Number one, and the single most important is that there is an obvious need to dramatically increase the investment—and I use the word "investment" purposely—the investment we are making in our transportation infrastructure.

You know the history of what has happened to the authorization and appropriation process over the last 10 years. We have gone from $4.6 billion a year in transit alone, not even counting highways down to today's appropriation of 3.1. Almost a 50 percent drop in real terms. And more than that in inflated terms over that decade.

We feel, when I say "we" I am talking about a survey we did of all the transit agencies in the country, that $6.5 billion would be required to maintain the existing infrastructure that we have in public transportation in this country whether it is bus or rail. In other words, what we are saying is that we need to double the amount of investment that we are making at the federal level in order to maintain the existing infrastructure.

In addition, we see a need, a dramatic need for expanding the role that we are playing in meeting these national goals. The president of the R&E board, Mr. Pat Sorse and others have highlighted the fact that in order to meet these goals locally here, we are going to have to dramatically expand the effort that we are making. So when an additional 4.5 billion is being recommended at the federal level for a total of $11 billion, or an additional seven cents on the gas tax just to meet the transit piece of the pie here, and I have not talked about the highway piece yet.

It was mentioned earlier by our Vice Chairman Mr. Grabinski that we have got a four legged partnership here. A four legged stool that is the funding partnership for making all this happen. And that includes the State, the Federal Government, local government and the private sector. And as you know, here in the State of California in the last few weeks, we re-upped our investment here in the State which was a significant step forward. We also need to have the Federal Government re-up its share of this funding partnership and although it is not a majority of the funding, it is a very, very important part of that partnership.

You have heard the testimony prior to my coming here that between 6 and 10 percent of all the operating funds come from the Federal Government. Nevertheless, it is an important 6 or 10 percent. And you have also heard testimony that of the capital program that we have here in the next decade in Los Angeles County, approximately 25 percent of the total capital costs are coming from the Federal Governments. Seventy-five percent from local and State. Nevertheless, without that we would not be able to do what we have got planned here in order to deal with the issues I outlined earlier.

The second point I would make is that there is a tremendous desire to make permanent and to have some regularity in the funding whatever level of funding is agreed upon. I know Chairman Mineta has expressed a lot of concerns on the issue of the gas tax and taking it off budget and I can assure that the association is

supportive of any effort that would give us some ability to count on funds coming in on a regular basis.

Third, we need to expand the scope and the definition of what is called "transit," to include shared rides, car pools. Anything other than a single occupancy vehicle because that is really the issue here, is trying to improve congestion and whether it is in a 40-foot bus, a rail car a van pool or a car pool, it does not really matter as long as it gets the job done. What we need to do is focus national policy on moving people, not on moving vehicles.

Fourth, the federal tax code needs to be revised. Jim Sims the president of the Commuter Computer will talk about that I am sure in more detail in a minute regarding the incentives and disincentives for transit passes versus parking by private employers.

I would just add sort of an answer to an earlier question I believe the Chairman made, that there are a lot of things that could be done to encourage more private sector involvement. For example right now, the tax code does not allow private sector to float tax exempt bonds for a public purpose project. I would suggest that there is a way to carefully define a public purpose project so we do not get into the problems that we had in the past with the industrial development bonds that still would serve the public good.

And finally, I would point out that the effort needed to do more research and development is obvious. Just to give you a point of comparison, the West German Government last year spent $12 billion in R&D in public transportation and all forms of transportation. In this country we spend $150 million of Federal funds. We are not even in the ball park in terms of taking on an issue such as going to the moon and investing monies in that type of a research effort to produce results over a period of time. We need to take the same approach here in dealing with our transportation problems.

Also the Federal Section 9 operating assistance is critical and needs to be continued so that those properties that—where additional assistance, particularly smaller properties can continue to serve the important role that they play in their local communities.

And finally, we need greater flexibility in the metropolitan areas so that we can make decisions and trade offs and what makes the most sense to the traveling public. The traveling public does not care whether on a federal or interstate highway, a State road, a county road or a city street; they want to be able to get to where they are going and get there when they want to go there and to be able to count on some regularity on how long it is going to take. Similarly with our public transportation systems, they do not really care whether they are on a RTD bus or Long Beach Transit bus, Dial-a-Ride or what have you, they want to be able to get to where they want to go.

It is that kind of flexibility that we need here at the local level in order to better utilize the scarce resources that we have got. Mr. Chairman, I think I will stop my remarks at that point and I appreciate the opportunity to present this to you and I will be glad to answer any questions you might have.

Mr. MINETA. Chairman Anderson.

Mr. ANDERSON. Thank you, Mr. Chairman. Mr. Peterson, the Southern California Association of Governments testified in our Washington hearings that in Southern California more than 95

percent of all trips made in that region are made in automobiles. And less than 3 percent by transit in any form. Now how can transit operators such as yourself, increase usage of transit when the private automobile continues to remain the mode of choice even in urban areas with extensive transit systems available?

Mr. PETERSON. That is a very good question. And you are right. That is the current mode split. I think what we need to do obviously in order to solve the problems of congestion have to improve that mode split from 3 percent to 6 or 9 or whatever it is in the particular local area. And I think there is something we can do about it. I think the answers depend frankly on the quality of the product provided as an alternative. You have to have quality alternatives so people at least have a choice.

So that is why it is so important that we introduce rail into Los Angeles here in the next fourteen days. The first rail in 25 years. And that that is a quality ride. On time, safe, graffitiless, and courteous drivers. Similarly, our bus operations, the quality of that bus ride, and all those same aspects needs to be dramatically improved so that we have a quality product to offer as an alternative.

Secondly, I think we need to dramatically expand the way we think about transit and not just limit it to bus and rail. But start thinking more aggressively about car pools and van pools and ride sharing and other types of shared rides types of alternatives. The numbers are dramatic, small shift. If one person takes somebody else to work with them once a week it reduces congestion by 10 percent on our roads today. A small shift in consumer behavior would dramatically affect our congestion.

And finally, I think, the rules of supply and demand affect our business as well as many others. The reality is there is a constrained supply of freeway lanes and other major arterial lanes in our area and with the exception of the completion of the Glenn Anderson freeway and a couple of other completions, there are not going to be any major new freeways in our area. So, supply is constrained and the question is how do the laws of supply and demand work. And I think people are going to be demanding some other alternatives and—such as HOV lanes in our freeways so that some people will get rewarded for sharing rides and be able to get there a lot quicker.

Similarly in the laws of supply and demand are the costs associated with driving an automobile and are those costs reflective of the true costs of society that that car and that choice of going alone—those kinds of issues. I think if you put all those together you have a chance of doing something about that 3 percent mode split and I think that is the mission that all need to be about and we need to state it as a national policy and we need to move forward on it in the next 10 years.

Mr. ANDERSON. The American Public Transit Association has recommended a near tripling of the federal mass transit program, how do you justify this type of an increase in light of the above mentioned statistics? Will an increase of this magnitude necessarily result in a greater percentage of trips made by transit?

Mr. PETERSON. Well again it is a good question. I think some of that increase, as I mentioned earlier, is necessary just to hold our own. I think we have learned a lesson in this country that unless

you continue to maintain the investment you are making you are going to actually fall backwards. And a good example here is in the State of California 20 years ago we were the number one state in the nation in terms of per capita investment in our transportation infrastructure. Over a 20 year period we fell to last, dead last until a few weeks ago when we voted to increase our gas tax again. But we allowed ourselves to stop that reinvestment to maintain that infrastructure.

So part of that money, as I indicated, approximately 6.5 billion of the request is to maintain our current position, if you will. And the same thing applies to highways. We know we need to maintain those roads in order to continue to perform its role. And then part of it I do think is, as I mentioned, 4.5 billion is to reflect a chance to do something about that mode split statistic. And I think there is something we can do about it if we all get together and have a goal in front of us and we all work real hard to do it.

Mr. ANDERSON. APTA has stated and I made a commitment to more than double United States transit ridership to a level comparable to the current per capita transit use in Canada. Why does Canada have such a higher level of usage. How does that APTA plan to see this goal realized in the United States?

Mr. PETERSON. I think the major difference here, and this is the major point I am trying to make, is that the other countries, Canada is a good example, have made a national policy statement on what they want to do with respect to the national transportation policy. The price of gas in Canada and Germany and France is approximately say $2 or $3 a gallon compared to $1 a gallon. That is not because the oil costs more to bring it over to those countries, it is because they have made a conscious policy that they want to encourage alternative modes of transportation in addition to the automobile and then the money that they gain from that additional tax they put back into funding those alternative modes. It is a conscious public policy decision. We have not been willing to do that.

The second major difference is that in respect to land use decisions, generally speaking Canada is a good example, other countries have been willing to make more—I guess the best way to say it is to have more influence over local land use decisions to insure that they are focusing development in ways that would complement a good public transportation system as opposed to disburse and make it more difficult to serve by a good public transportation system. I think those are the two most significant factors.

Mr. ANDERSON. Thank you, Mr. Chairman.

Mr. MINETA. Mr. Peterson, have you had a chance to look at the Caltrans report?

Mr. PETERSON. No, Mr. Chairman, I have not.

Mr. MINETA. I would appreciate it if you would have maybe some opportunity since this has now come to us, Chairman Anderson and all the Members of our Public Works and Transportation Committee and Members of the Surface Transportation Subcommittee, and we are going to be looking at this and so I would appreciate your analysis of what they are saying. Especially on that portion that talks about transit coming to the state through the TSNS program as they envision it.

Mr. PETERSON. I would be glad to.

Mr. MINETA. In your third point on the concept of transit should be broadened to include high occupancy, shared ride services, is there a definition of that? As to what high occupancy is? Is it two, three, four?

Mr. PETERSON. Well, my definition is anything over one. As you know LA, Los Angeles has the lowest vehicle occupancy rate of any major metropolitan area in the world. One point one seven. So anything over that is an improvement. The answer depends upon the local area. In Seattle for example it is considered more than three people in a car. Here, if you drove on the HOV lanes this morning from San Diego it is two or more. So I think it varies and it needs to be ratcheted up as those lanes get filled, then you would increase in another level. But anything over one is a tremendous plus for us at this point.

Mr. MINETA. You say that that will bring down traffic by 10 percent vehicular? What was the 10 percent?

Mr. PETERSON. Well it is even more dramatic than that. If you take one person to work with you one day a week that would reduce congestion by about 10 percent in our area.

Mr. MINETA. You say reduce congestion by 10 percent, that is what?

Mr. PETERSON. It takes that many vehicles off the road.

Mr. MINETA. I see. In the APTA Transit 2000 proposal, it is recommended that there be a new metropolitan transit program. What size area is envisioned for that program in terms of program eligibility and how would the mix between eligible transit and highway funding be determined?

Mr. PETERSON. We are thinking probably, although we have not finalized our recommendations on this, that we would be using the standard metropolitan statistical areas. Another option would be the urbanized areas. In terms of how the mix would be done, I mean this is a key question and our thought is that we basically require at the local level that the transit interests and the highway interests get together and give each one of them a veto power. In other words, the local area can not send forward a program that the highway programs will veto and vice versa, the local area cannot send forward a transit program that the highway people veto. That there be a mutual veto at the local level to insure that cooperation and to insure that one part of the program is not, you know, overwhelming the other part.

Mr. MINETA. I would describe it as a double green light system but when you have a stalemate what do you do?

Mr. PETERSON. Well it seems to me that that is the problem with the local area. That they need to work that out. I think there would be enough incentive for the local area to work that out because funding would be attached to it.

Mr. MINETA. And do you have a recommendation as to what the federal share for such a program would be?

Mr. PETERSON. The biggest recommendation I have is that it should be the same for all the different components of the federal program. In other words, right now, our federal interstate is 90/10. Our transit—I am sorry, FAU is 85/15. Section 3 transit is 75/25. Section 9 is 80/20. It is all in the——

Mr. MINETA. Should we make that all 80/20 or some other——

Mr. PETERSON. Yes, sir. It should be the same for all programs. So that we can make good decisions at the local level based upon need as opposed to trying to attract federal funds for whatever purpose.

Mr. MINETA. APTA has urged that the definition of "transit" should be broadened to include high occupancy—oh, I already asked that I think.

What would you say is your most pressing problem given the fact that you are one of the largest urban transit operators in the country?

Mr. PETERSON. Well, I think the answer that most would give is adequate funds, but I think my answer would be the ability to provide a quality product. And in order to provide a quality product, you have got to have so many things work together to make it work. You have got to have express lanes that allow buses for example to move freely and not get caught in congestion that other cars are caught in. You have got to have a good human resource program so you have qualified people with the right attitude dealing with the customers. You have got to have adequate funds so that you can pay for all of that. So I think it is the ability to provide a quality product that is the number one issue.

Mr. MINETA. Mr. Packard.

Mr. PACKARD. Thank you. Your testimony is excellent, Mr. Peterson. Of course your background is actually in this whole field of mass transit and we appreciate your willingness to come. Secretary Skinner has proposed that those that apply for grants, if they can put up a greater amount than the minimum local share, that they would be given priority treatment and consideration for federal funds. There are perhaps other methods of incentivising the use of private and local funds which I think all of us will recognize. With a shortage of funds at all levels we are probably going to have to look at all of these types of techniques. What is your opinion and evaluation of those kinds of programs?

Mr. PETERSON. Well, speaking with my Los Angeles hat on for a minute obviously we tend to benefit from that because we have made a major effort in that regard. The specific Metro rail projects that we applied for federal funds were contributing 50 percent in local dollars; and if you look at our entire rail program, over 75 percent of it is funded locally. So we believe in a strong local commitment and we are prepared to do it.

On the other hand, with my national hat on and I have had a chance to talk to people throughout the country on this issue, who are not in favor of it because there are some areas of the country that do not have the luxury that we have. We have imposed a local option sales tax on ourselves. We have a state that has just upped its gas tax. And there are some communities in this country that just do not have the luxury of doing that and yet their needs are very real.

Mr. PACKARD. How would you propose then to balance that? It is unfair for California to continue to subsidize because of their willingness to vote a half cent sales tax locally. How would you balance that out then so that we are not continually being called upon

to subsidize those areas that simply either would not vote such a tax increase or they cannot simply afford to fund at the local level?

Mr. PETERSON. Well, I think one way of perhaps dealing with it is that as you know now, there are a lot of federal regulations and requirements that come with any federal dollars that come through. Secretary Skinner has also indicated that he would be willing to relax those dramatically. The higher the local contribution. So we would be very interested, for example in getting a tremendous relaxation in those standards and regulations and requirements in return for having put in a larger local share.

I will give you an example. The metro rail project we have underway right now. We are spending $100,000 an hour, as we sit here. To the extent that we can reduce time on that construction project by not having to go through a variety of different tests and what have you, we are going to be able to save significant dollars. And since we are contributing if not a majority, at least a half of the cost of that project, it is in our interest to do that. So there is a way that we could get some real benefit and at the same time allowing another section of the country that does not have the option that we have to still get some money for their project.

Mr. PACKARD. The California Transportation Commission earlier, as you may have heard, was recommending passthrough mass transit monies from the feds, rather than going directly to operators pass through the state and allocate it, I think, through that mechanism. What would that approach and attitude be on that?

Mr. PETERSON. Well, we would disagree with that. We think that the current system is working well. For a public transportation monies it comes to a local metropolitan area where the problems are and as a designated recipient and that is working.

In answer to Chairman Mineta's question earlier, I was suggesting a way of allowing the existing system to work better. Where highway monies could continue to come through the state level, the transit—the public transportation monies could continue to come locally, but at the local level they are resolved. In other words, the use of any funds at the local level must have a buy off by all parties. And then come back and show you how this is improving mobility and reducing congestion regardless of the way it comes in.

Mr. PACKARD. Does that require another agency that would combine the different modes of transportation agencies?

Mr. PETERSON. No, I do not believe so. I think it is a question of sitting across the table with the existing agencies and reaching an agreement.

Mr. PACKARD. Thank you, Mr. Peterson.

Mr. MINETA. Thank you. Mr. Hastert.

Mr. HASTERT. Thank you, Mr. Chairman. One of the things we have been talking about here is being able to legislate federally and yet not mandate excessive costs on the local governments, the transit agencies, etc. How do you feel about the Clean Air Act and the ADA, the Americans With Disability Act. Do you think you are going to be able to, if they become law this year, actually implement them without a great increase in cost to your system?

Mr. PETERSON. Number one, I think the transit industry is behind making both of those happen. Those are national goals and we are going to make them happen but number two, I think you

have heard from the testimony there is no question that it will not increase the cost of doing business. So unless we have some additional relief in whatever form, as the Chairman has indicated, and additional funding is earmarked, it means that something else is going to drop off, you know. So it does have a financial impact.

Mr. HASTERT. Or an increase in the fare box?

Mr. PETERSON. That is correct.

Mr. HASTERT. Which tends to depress ridership too.

Mr. PETERSON. Yes, it is absolutely counterproductive right now because, as you heard, here we have one of the highest fare structures in the nation. Now we have the highest fare box recovery of any major bus agency in the country. We are doing our job in that regard. What we do not need to do is increase that cost even higher to discourage more people coming over on these alternative modes that I was outlining earlier.

Mr. HASTERT. You said something that perked my interest a little while ago. You said that you actually recommended the integration of transportation investment and land use decisions and said maybe the Federal Government ought to get involved. Maybe I heard you wrong, but you said maybe that the Federal Government would want to play a role in that. Don't you think that is an infringement really on local issues, where you are going to put the next planned community, etc.? It is hard for us to be able to, at least from my point of view, deal with that because all of a sudden you are really trampling on local interest city planning, state, you know, county planning, etc.

Mr. PETERSON. Yes, sir. But I think there is an opportunity here to maintain the integrity of local government decision making on land use decisions and yet provide incentives from the Federal Government that tell—that say very clearly where we want to go as a national policy.

Mr. HASTERT. What kind of incentives?

Mr. PETERSON. Yes, I would do it through incentives. In other words, additional funds would be available if, as opposed to telling local government you may not do this. And I think essentially that is what happened here at the state level. It was mentioned earlier that the Propositions 108 and 111 have a provision in there which means that any new development that goes in in a given area now if it has an impact, a negative impact on congestion in the surrounding area, that they must fund the mitigation necessary to improve, to fix that or provide dollars to some other form of improvement that will help the area. Now that is not saying you can't put it there. But it is providing the real incentive to the local government and to private business to make sure that they are dealing with the problem funding.

Mr. HASTERT. And that is really what the state does that, not the Federal Government, now—your example?

Mr. PETERSON. Right, but viewed from the local level, that is just as bad.

Mr. HASTERT. I understand. I see your point. There is really a hurdle there when you start to set up federal policy and tell us to tell local government or county governments what to do.

One of the questions or concerns that I have, I guess, prompted Congressman Packard's statement is that California would be sub-

sidizing other areas of the country. I guess there are unique problems when you start to have huge metro areas. I am from a metro area myself and we have a higher gas tax than anybody else in the state and maybe anybody else in the country. And I guess we all feel that we are protecting our own turf but I think those efforts have to come in that type of a tax which is really a use tax and in a sense a concentrated effort that—let us try to find solutions to these problems, light rail and etc. Some of the things we have to do and I guess maybe one of the things this Congress has to do is look at those unique situations and to start to do some strategic planning there.

I have enjoyed your testimony. Thank you very much and thank you, Mr. Chairman.

Mr. MINETA. Thank you very much for your testimony here as well as for your leadership as a member of the legislative committee of APTA. I know that we will be working with you and APTA in the next 16, 117 months as we put together this very big piece of legislation that we will have to have in place by 1 October of this next year. So, again thank you very much for your leadership here in LA County as well as on the APTA legislative committee.

Mr. PETERSON. Thank you.

Mr. MINETA. At this time, out of necessity, the Chair will recess for five minutes.

[Recess.]

Mr. MINETA. If the subcommittee would please reconvene. At this time we will hear from the Director of Service Development for the North San Diego County Transit Development Board, Mr. Paul Price. Mr. Packard?

Mr. PACKARD. Thank you. I would like to simply make a comment as we introduce Mr. Price. I had the privilege of working with him as I served on the North San Diego County Transit Development Board for several years and had the opportunity to work with him at that time. That was before I was demoted to this position several years ago. But we are very pleased to have Mr. Price here to represent transit in San Diego County and we are looking forward to your testimony, Mr. Price. Thank you very much for being here.

Mr. MINETA. Mr. Price, you may proceed.

TESTIMONTY OF PAUL PRICE, DIRECTOR OF SERVICE DEVELOPMENT, NORTH SAN DIEGO COUNTY TRANSIT DEVELOPMENT BOARD, OCEANSIDE, CA

Mr. PRICE. Thank you, Chairman Mineta, and Chairman Anderson, Members of the subcommittee, I want to think you for allowing me the opportunity to testify today on behalf of public transportation in the San Diego County area. Let me take a few moments to underscore the degree to which the San Diego region and the state of California has acted to improve public transportation throughout the region of San Diego and California without significant federal involvement. In fact, the efforts made in San Diego County were made despite federal reductions over the past 10 years. Locally the San Diego County region has taken initiatives in a very rapidly growing area to look beyond our current funding

shortfall and growing transportation gridlock to not only plan but to begin implementing one of the best and most cost effective new public transportation networks in the nation. I need only point to the San Diego trolley as one of the prime examples of leading the way of rail transportation in the last few years.

Locally, at North San Diego County Transit Development Board in 1980 federal funding provided 20.8 percent of North County Transit District's operating costs for an estimated 7 million riders. In 1990 the federal operating revenue amounted to only 11.9 percent of the cost for 10 million riders. To show the degree to which the public and the voters believed that we are in a transportation crisis, the voters in San Diego County in November of 1987 voted to tax themselves at the rate of one-half of one percent toward the state transportation sales tax for transportation. These monies were divided up for transit highways and local streets and roads. Then again in June of 1990 the voters in the state of California passed Propositions 108, 111 and 116 which will double the gasoline tax in the state of California over the next five years to pay for significant rail transit and highway programs. Yet this massive infusion of state and local funding has been met with reductions at the federal level as can be seen in the Tables, in figures on pages two and three.

The city and/or county regions unmet public transportation needs of the next 20 years amount to over $1 billion. The state and local governments have developed a plan to meet a $4.9 billion requirement over the next 20 years in San Diego County.

The state and local plans provide $3.8 billion of this $4.9 billion requirement. We would hope that the Federal Government would find its way to meeting its 20 percent share for this region. If we are to meet the national objectives of the clean air, reduce congestion, and fuel conservation, all layers of government, including the Federal Government must be willing to implement their share of the costs.

The San Diego region calls for the development of over one hundred miles of rail transit, new projects as well as significant improvements to the bus network to achieve our clean air and congestion relief goals.

On another matter the San Diego County region has been involved with both politically and financially the Los Angeles to San Diego rail corridor, or let me say now the southwest corridor for Amtrak service between Los Angeles and San Diego. This short corridor is the second busiest intercity passenger rail corridor in the nation carrying some 1.65 million passengers annually. Yet, as can be seen, the amount of federal participation and the improvements to this corridor amount to something less than 13 percent of the improvements made to date.

Even this 13 percent, comes up to federal participation of approximately $16.5 million over the past 11 years. In contrast, direct federal appropriations and UMTA grants they have spent some $2 billion over the last 15 years in the so-called northeast corridor. Some federal recognition of our corridor is paramount to our goal achieving mobility to the citizens of this region.

To that end, the representatives of Los Angeles, Orange and San Diego County regional agencies have established a Los Angeles to

San Diego rail corridor agency called LosSan and have developed a 12-year capital improvement plan necessary to maintain and improve services in this important industry corridor.

As you may be aware, this particular intercity corridor is generating 111 percent of its operating costs out of the fare box. If we are to sustain this phenomenal achievement, infrastructure improvements must be made immediately. The LosSan agency has developed a 12-year capital improvement plan which totals some $323 million. Of that we would be looking to Amtrak and UMTA for some $70 to $100 million of this improvement costs.

In conclusion, while we are all aware of the budget shortfall at the federal level, the state and local governments should not be penalized for being pro-active in developing local and state funding sources. To withdraw or even reduce federal participation at this time would send a clear message to other federally funded projects that locally developed funding sources hasten federal participation withdrawal which would then lessen any local attempts to solve future problems.

Specifically to the issues at your meeting here today we would recommend that the federal—on the federal level that there be developed a dedicated funding source through some sort of functional trust fund. The annual trial and tribulation of current UMTA funding policy leaves local agencies very much behind the eight ball in trying to second guess in budget development what may be happening. A degree of regularity would go a long way for practical budgetary decisions.

Second, allow for block grant funding for transit to be used discretionarily within the region without matched requirements. Locally matched efforts should be based on overall regional efforts and not on the effort of a single project. This would allow the region to package funding sources without distributing on a very bureaucratic basis preciously short funding to a multitude of important projects.

Third, federal laws, rules, and policies have the significant operating cost impacts. The Federal Government bears some responsibility for funding of these cost impacts. For example, pursuant to federal policy and soon to be law, the district has spent over $2 million to lift equip entire fleet of buses. This fleet of wheelchair lifts has cost approximately $200,000 a year to maintain. Current ridership figures show that out of 35,000 daily riders, only 10 trips made use the federally required equipment.

Fourth, federal appropriations to intercity Amtrak corridors should be made on a dense high use corridors. Public transit is not just an intracity issue, but an intercity as well. Already Amtrack carries more passengers between San Diego and Los Angeles than all major airlines combined. A small capital investment into this important intercity corridor may be able to minimize or mitigate the need for even larger and more expensive regional airports.

Again, I want to thank you Chairman Mineta, Chairman Anderson, for this opportunity to speak to you today and I will be pleased to answer any questions you may have.

Mr. MINETA. Thank you, Mr. Price. Chairman Anderson?

Mr. ANDERSON. Thank you, Mr. Chairman. Mr. Price, I have a couple of questions related to your projected costs and revenue

through 2010. Now first you factor in a declining amount of federal assistance under Section 9 and the Federal Aid Urban Program, now what assumptions did you make in determining this declining amount?

Mr. PRICE. Chairman Anderson, what we did in determining our cost allocations is that we tried to be very conservative and assume a worst case scenario or a practical scenario. What has been happening over the last 10 years has been a, in fact, budget reduction or investment reduction by the Federal Government on the basis of Gramm-Rudman and what we have done is projected what that would be over the next several years and assume that that would be the case in the future.

Mr. ANDERSON. Well, why do your projections assume no amount of Section 3 capital funds and have you received any Section 3 funds?

Mr. PRICE. Our Section 3 funds have been very limited. As we I understand it, the San Diego Metropolitan Transit Development Board is now trying to get on line when the first major and significant Section 3 project which is the extension of a trolley from Old Town in San Diego to the Del Mar area and that will be a grand application ultimately in the range of $275 million.

Mr. ANDERSON. Now your projections show a shortfall of more than $1 billion over the next 20 years. Now assuming the Federal Government will not be able to make up all or most of that shortfall, what kinds of programs will you have to cut or alternatively what other sources of revenue will you have available?

Mr. PRICE. In the region in San Diego, we are undertaking a very ambitious program to bring development fees into the process of funding public transportation and highway improvements. We have established a committee through SanDag that has deduced how much new development will cost the region for all kinds of facilities. And one of those facilities is transit and highways and what we would hope to do is to develop a model ordinance that would be adopted by the rest of the agencies, rest of the cities, and the county as an impact fee and that impact fee will go towards assisting the reduction of this deficit.

Mr. ANDERSON. I notice you limit yourself specifically to north San Diego. I thought I would let you know something that over the years I have noticed recently the congressman from your area, he always seem to manage to get a little bit out of one of my programs down there around Oceanside.

Mr. PRICE. Mr. Chairman, I cannot let that pass without just responding that you are so capable in developing up—developing such a surplus of monies coming to your area that you can almost afford to give away a percent of it to some of the poor people down south.

Mr. ANDERSON. In order to get his vote probably.

That is all, Mr. Chairman.

Mr. MINETA. Mr. Price, one of your recommendations for changes in federal funding is for block grant funding within the region without matched requirements and I am wondering if you could sort of expand on how this would work?

Mr. PRICE. What we are looking at in our particular region is an overall planning scenario. We have developed a list of projects that

we would like to fund. The difficulty that we have is oftentimes UMTA policy is to look very narrowly at how much investment is being made in a particular corridor and a particular project and not overall within the region.

Currently, based on our 20-year projections, less than 5 percent of the funds will be provided on a federal level. And what we would like to do is to develop a regional necessity list as we have done here and show that regionally we are not asking for that much or very significant federal funds but we do not want to be stuck into a position of having to spread it over a lot of small projects in order to make it look like we are providing 75 percent of the funding locally to any one project but be able to show that overall within our region the funding split is very significant towards—weighted towards local and state involvement.

I would be I guess remiss if I did not point out that although Metropolitan Transit Development Board will be submitting a request for $275 million for the corridor from Del Mar to Old Town that is about 75 percent of that particular individual project cost. But given all the projects in the county, it is a very small amount.

Mr. MINETA. I am not sure how that would differ from how the grant kind of process works right now.

Mr. PRICE. Right now, on a grant type of process UMTA is beginning to pay more attention to local participation and how much local participation there is on any particular given project and if we try to lump the federal funds into one particular project, it looks very heavily weighted towards a federal participation level. But if you take a look at all of the regional projects, for example, at north county, we are funding a commuter rail line, a 43-mile commuter rail line and a 22-mile light rail line entirely with local funds and we are not showing that as a match to any other federal project. So that one individual project that MTTV is attempting to go for does not look very heavily weighted locally but regionally it is. What we would like to do is to have the block grant come to the region as a block of money as a federal participation in San Diego County's development and not be concerned about how much of a percentage of that goes to any one particular project.

Mr. MINETA. I would like to ask about the Amtrak service in the Los Angeles to San Diego area and whether or not what you are doing does not create a conflict of some nature that with the kinds of—as I understand—capital improvements that they need, for instance like signalization, does that diminish their ability to do that, given the competition so to speak that will come in from what you are envisioning here in the Los Angeles/San Diego corridor?

Mr. PRICE. I am not sure that I understand the question.

Mr. MINETA. Well, maybe I am misinterpreting what you are talking about in terms of the Los Angeles/San Diego corridor and the service to be provided there and what Amtrak is going to be doing.

Mr. PRICE. On the Los San Corridor agency there are members made up—it is membership is made up on the GAPA of members from LACTC, Orange County Transportation Commission, Caltrans, and one from our board and one from the Metropolitan Transit Development board. And we developed our capital improvement plans on the basis of something that was mutually acceptable

to all the agencies. In other words, the CIP was developed which would be beneficial, not only to commuter rail but to intercity rail projects as well. And how we fund these sources is a matter of some discussion right now. There is definitely a lack of federal or Amtrak involved in these particular corridors and what we are trying to do is to develop that particular funding scenario. It has not at this point in time.

Mr. MINETA. I guess I am a little confused. Are you providing any kind of capital improvement for Amtrak?

Mr. PRICE. Yes, we are. On a locally provided basis. Our—a share of our locally—local sales tax monies are providing capital investment improvements on that corridor.

Mr. MINETA. Okay, all right. That is what I did not understand then. Thank you, Mr. Price.

Mr. Packard?

Mr. PACKARD. Your entire fleet of buses are retrofitted and have been for some years, is that correct, with lift facilities?

Mr. PRICE. For two years. For the past two years yes.

Mr. PACKARD. So those districts and operators that do not have all of their fleet retrofitted under the Americans With Disabilities Act, where will those funds come from? From Section 3 monies or what kind of capital funds will those districts use to retrofit their fleet?

Mr. PRICE. Some of the areas—Section 9 can be available—made available. That does reduce the number of buses that they can purchase because there is a finite amount of monies identified for each particular region or Section 3 is very difficult to get. It is a very competitive market for Section 3 funds and its very difficult to get those funds. I think what most transit operators have attempted to do over the last several years is phase these in as the buses reach their——

Mr. PACKARD. Well, they have certain requirements under the ADA bill. How will they meet those requirements? Where will the funds come from.

Mr. PRICE. I think they have the opportunity to do one or two things. Use their Section 9 monies to retrofit existing buses thus reducing the number of new buses that they purchase and that essentially is defeating another purpose of the Clean Air Act because it keeps older dirtier buses on the streets longer. Or they try to generate some local funding source to help retrofit these buses. But it does begin to get expensive over a course of time.

Mr. PACKARD. The law does not require that old vehicles be retrofitted but they will—most districts will want to retrofit I have to assume. They simply will not want to maintain a fleet that is not retrofitted. The point of the question I am trying to get to is, will that siphon away funds, for those districts that have already got their fleet appropriately serviced and fit with those facilities will that siphon away funds from them? Will you find that other districts will be competing for those funds to build up their fleet to comply with the ADA bill, and thus make those funds more competitive and more difficult for you to get?

Mr. PRICE. Well I think in the San Diego County region under Section 9 it would not be a problem. We should be able to meet the federal requirements. Under discretionary funds there is preciously

short discretionary funds as you are well aware. And if the competition increases with that particular funding source it does take monies away from the important expansions that we are looking towards.

Mr. PACKARD. Essentially, you will not have any major problems or concerns in terms of funding to comply with the ADA bill?

Mr. PRICE. Not in terms of our buses. We do have some significant concerns in terms of rail vehicles.

Mr. PACKARD. Have you evaluated what the Clean Air Act will do in terms of your budgeting?

Mr. PRICE. We, under the various versions of the bill, if the clean diesel alternative is maintained that goes a long ways to satisfying and ameliorating our concerns. We have to take a look at our alternative fuels. We would have a significant concern because alternative fuels have not proven themselves as very effective. Methanol has proven to be very costly operating cost wise and has shown a great deal of wear on the engine. Typically on a diesel bus engine we can get 250,000 to 300,000 miles. A methanol bus has been running 50,000 maybe 80,000 miles, so you have a significant cost increase in the fuel and a significant cost increase in the maintenance of the vehicle and out-of-service time so you have to increase your fleet size accordingly. The clean diesel approach at this time is the most logical approach.

Mr. PACKARD. Is the North County Transit District doing any—do they have any portion of their fleet that is using any of the alternative fuels?

Mr. PRICE. At this time, we have completed contract agreements with San Diego Gas and Electric and we will have a compressed natural gas bus on the road by this fall non-federally funded. Completely locally funded. We do have a grant in with UMTA under Section 3 discretionary for the last several months for seven C & G buses to go along with that. We do not know the status of that at this time.

Mr. PACKARD. What is your biggest problem that you have to deal with in a small district?

Mr. PRICE. As a small district, our biggest problem is we like to keep consistency in fleet types and size and equipment. As you get to exotics it requires a whole new training of personnel, mechanics, a very large management team to try to manage these new skills and techniques and we have tried to run a very lean operation. In San Diego County, as you are aware we have been in the forefront of going out for competitive bid for services in our region whenever we have a new service that comes on the road. At North County Transit District we have been able to not have competitive bids with private operators because they frankly admit that they cannot beat our price. We run a very lean and a cost effective operation. I am concerned that this would change as it gets more difficult to maintain a consistent uniform fleet.

Mr. PACKARD. Thank you, Mr. Chairman.

Mr. MINETA. Mr. Hastert.

Mr. HASTERT. Mr. Price, thank you very, very much for sharing with us your operating experience. I appreciate it very, very much.

Mr. MINETA. At this time I would like to call on Mr. James D. Martens, Chairman of the California Highway Users Conference.

Your statement will be made a part of the record and if you would go ahead and introduce your colleagues and proceed at your own discretion.

TESTIMONY OF JAMES D. MARTENS, CHAIRMAN CALIFORNIA HIGHWAY USERS CONFERENCE, UPLAND, CA

Mr. MARTENS. Today I have with me G. Robert Lewis, the executive director of the California Highway Users Conference, to my left and to my right, Mr. Ronald Johnson who is a member of our executive committee.

Mr. Chairman, my name is James Martens. I am the Chairman of the California Highway Users Conference and we are very pleased to have the opportunity to testify here today before the committee. We realize that the timing was rather tight and critical but we did get through.

The California Highway Users Conference is a state coalition made up of 80 organizations dedicated to encouraging the full development of the highway transportation system in the public interest. We are affiliated with the Washington, D.C. based Highway Users Federation but remain autonomous from the national association.

The Highway Users Conference was very active here in California in the passage and in supporting Proposition 111 and 108 which you are well aware of today was approved by the voters last month.

This referendum calls for an increase in California's vehicle tax—excuse me—motor vehicle taxes along with truck weight fees. These increases though are only going to be able to meet about half of what California's problems are. We did prove one thing here in California: as a people we are willing to vote an increase in taxes if they are sure that the proposed intent is vital to their needs.

As I stated, it only covers one half of our problem. The other half is the states highway picture from the federal highway program. We will depend very much on the reauthorization of a timely federal legislation. Your committee's task in shaping this legislation is vital to the state and our entire nation's economy through the next century.

I will not go through every detail of the future program but if you would allow me I would like to cover some general concerns.

First, we would like to start by noting the support of a nine point program placed before your committee by the Highway Users Federation. Some of the specific points we want this legislation to cover include providing increased resources. We support the federation's proposal for a 4-year reauthorization bill with annual funding from federal aid highway and transit programs of $22.9 billion annually beginning next year.

In real dollar terms, the Federal Government is spending 25 percent less today than they did in 1983. Even though travel has increased some 27 percent. These reductions have allowed the surplus to build within the federal highway trust fund. Today the surplus stands in excess of $17 billion. Highway Users share the national concern over the federal budget deficit and are willing to share in a reasonable effort to bring the deficit under control. But any decision to artificially constrain highway spending to create a

deficit masking surplus in highway trust funds clearly has an undesirable impact on the domestic economy.

Chairman Anderson, we applaud your efforts in sponsoring House Resolution 481 which clearly indicated the opposition of the House of Representatives for using motor vehicle tax for deficit reduction.

Distributions of funds. The major strength of a federal program is that it has been based on equitable distribution system that insures in even smaller—where even smaller states were able to construct an adequate highway network. Our conference urges, however, that donee states such as California have their guaranteed return increased from our current 85 percent to 90 percent.

Decisions must be made closer to home. In the post- interstate construction era, federal highway dollars will be needed to maintain the system and to make the highway improvements in metro and rural areas that were either passed over, unanticipated, during the post-interstate era.

The Conference supports increased flexibility for states in using funds under many of the programs classifications. This flexibility is particularly important in program elements such as a $4 billion metro transportation category proposed as part of the Highway Users Federation plan. The bill should also insure that projects be funded upon a basis of priorities set at state and local levels consistent with clean air goals.

The transportation sector has a tremendous responsibility to minimize travel related pollution. Clean air and a sound transportation policy allowing sufficient mobility to grow as a nation are not mutually exclusive. In fact, we are mutually reinforcing. By reducing congestion and free traffic flow, highway improvements can significantly improve air quality.

Mass transit. We support increased spending on mass transit. In large urban areas, its use is part of the transportation solution. In fact, the Conference believes that metropolitan ares should be able to choose to spend some of the their Federal Highway Trust Fund dollars on either highways or mass transit. In addition the legislation should earmark 3 billion annually out of the general fund for mass transit.

Research and Development. Increasing highway capacity is only part of the solution to traffic congestion. Increasingly, we will need to learn how to gain the maximum efficiency out of our highways. We will have to augment traffic capacity through the use of new technologies which allow the road system to be used more efficiently and made safer for all drivers.

The Conference recommends a program which will fund a public and private development for various smart car/smart highway technologies.

Passage of the reauthorization. Hopefully, we have all learned from the six-month delay of the Federal Highway Program in 1986–87. The transportation community has worked since that time to form a consensus on key issues and assist the legislative process. We realize that the Congress has many other issues besides transportation to consider so we believe it is critical that the subcommittee prepares legislation in a timely fashion. The sooner the legislation reaches Congress, the greater chance we have of passage of an

excellent bill and avoiding delays in the program. We should not risk the delay of badly needed highway projects because of late approval of the bill.

Mr. Chairman, the Conference believes that we have won a major victory here in California on June 5th and agreed to pay for badly needed highway improvements but yet we have only won half the battle. If Californians are to enjoy the freedom of mobility well into the next century, we must have Congress approve a far-sighted rebate of the federal highway program. We do not underestimate the difficulty of your task that your committee faces. But the Conference puts confidence in your leadership and this committee's ability to craft excellent legislation and then to insure that it receives timely Congressional consideration.

Mr. Chairman, we appreciate the opportunity to review the Conference's proposal with you and would be pleased to answer any of questions that you may have.

Mr. MINETA. Thank you very much, Mr. Martens. Chairman Anderson.

Mr. ANDERSON. Thank you very much, Mr. Chairman. Mr. Martens, in your proposed federal highway and transit program of $22.9 billion, how much of that would be for highways and how much for transit?

Mr. MARTENS. I will defer to Mr. Lewis.

Mr. ANDERSON. Okay.

Mr. LEWIS. Chairman Anderson, specifically the $22.9 billion is broken into the nine functional point program that Mr. Martens referred to that was suggested by the National Highway Users Federation. Specifically, and I do this very briefly in the interest of time, it was about 4 billion placed into the interstate program. Secondly there was the national arterial which was about $3 billion. Third was about $4 billion on the urban system of which was mentioned in this presentation.

In addition to that, there was another two and one-half billion dollars for the county road system, another $2 to $2.5 billion for the bridge network and in addition to that some $945 million for highway safety programs. In addition to that, another 900 million for the scenic highway network that was recommended and then there was some $100 million set aside for the research and technical proposal.

The transit recommendations was for the $3 billion of general funding as was mentioned in the presentation and then any additional transit monies that metropolitan areas—major metropolitan areas in the country would deem necessary it would go for highways or transit. I believe that was mentioned.

Mr. ANDERSON. Well, 3 billion was transit and about—Mr. Lewis. That was from the general fund, Mr. Chairman.

Now how quickly would these funding levels spend down the balances in the highway and transit accounts of the highway trust fund? Cause both of them, I think, are above.

Mr. LEWIS. Chairman Anderson, that would be, if I am not mistaken, I believe it would be approximately four years to 1995.

Mr. ANDERSON. That would take you that long?

Mr. LEWIS. I believe it would, yes, sir. I believe it would take about four years until 1995. This would begin in 1991 until 1995.

The program itself would not require an additional increase in any federal modal fuel tax but actually it would be a draw-down of the existing excess revenue within the federal highway trust fund today. Right now it is $17.28 billion.

Mr. ANDERSON. Are you proposing that metropolitan areas should be able to use some of their highway trust fund dollars for mass transit? Are you referring here to funds out of the highway account of the trust fund? And how much of this highway money should be available for transit purposes?

Mr. LEWIS. Mr. Chairman, Members of the committee. The specific comments that were made with regard to that urban areas, that is correct. That those specific monies that were directed towards the urban metropolitan areas would be allowed to be used for transit as well as road projects has to be determined on a local level. Also within the presentation as it was written there are the feelings that the local area should have that opportunity to make the decisions as they are the closest to the problems within transportation in the respective counties and cities. And so in answer to your question, it is yes. A portion of that money going to metro areas could be used for transit.

Mr. ANDERSON. It does come out of the highway account, doesn't it?

Mr. LEWIS. That portion would be able to come out of the highway account.

Mr. ANDERSON. Thank you, Mr. Chairman.

Mr. MINETA. Mr. Martens on page 2 of your testimony you say that the—you are supporting a four year authorization bill. Is there any reason as to why four years since our present bill is five years. I believe the Highway Users Federation, I believe Mr. Lamb is talking about a five year period at the national level, I am not sure.

Mr. MARTENS. Mr. Chairman, on the conference—the California Conference, I believe basically settled on a four year bill just basically looking in terms of history of the 1970 bill, the 1974 bill that we had, the 1978 legislation, most of them seemed to have gone for two or four years. I do not believe that the conference would oppose at all a five year bill. And if the committee and our Congress believes that this would be in the best interests, certainly we would agree.

Mr. MINETA. Mr. Martens, if you would review for us the details of your $4 billion a year metropolitan transportation category, especially how would these funds be distributed and how much flexibility would the local government have in determining the types of projects that could be funded? You talk about the bill should also insure that projects be funded upon the basis of priorities set at the state and local level.

Mr. MARTENS. Mr. Chairman, Members of the committee. You have several questions that I will try to answer them in order. With regards to that $4 billion specifically. The urban areas throughout the country in California as well as I am aware of other states as has been stated in testimony earlier, has voted sales tax increases or other fees in some metropolitan areas—there are actually motor fuel fees—upon themselves for either road or transit improvements. And in this particular case, the $4 billion would

be, would go to the metropolitan areas on a direct basis, for it is our feeling that they know the best as to where those monies would be spent. The $4 billion, and Mr. Chairman, I would almost have to ask you a question, with regards to California and the rest of the country, it is our assumption that this $4 billion would be on a national level. Certainly within California, the major metropolitan areas. There are 17 right now—counties that have passed this half-cent sales tax. And certainly they would recognize the needs in terms of roads and transit.

And it is our feeling that the request would be made to our National Department of Transportation and to the Congress for these specific monies with an X amount, depending on the metropolitan area—an X amount to be going for transit and an X amount for roads.

Mr. MINETA. All right. Mr. Hastert.

Mr. HASTERT. The reason I asked you about this is—and you clarified it or mentioned right now with the application going to the Department of Transportation or to the Congress and I was just wondering whether you were trying to get at—whether you were aiming at demonstration projects there?

Mr. MARTENS. No. No, sir. Not demonstration projects in any way whatsoever. I think it is the feeling, the California Highway Users Conference as well as the Highway Users Organizations throughout the country for many years have supported not only increased revenue and funding for needed streets, roads and improvements, but also have supported strongly such ride sharing and car pooling measures, as far back as the early 1970's. There were comments earlier that were made with regards to the Environmental Protection Agency and Mr. Ruckelshaus as we spoke during our break and even in that era of 1971, 1972 and 1973, the Highway Users throughout the country have supported ride sharing and car pooling and van pool programs, so we support these to a great extent for the metropolitan areas as well. Traffic demand management.

Mr. MINETA. Mr. Lewis and Mr. Johnson, thank you very, very much. At this time I would like to call on Thomas Conneely, President Association of California Insurance Companies and James Snyder, President of the Personal Insurance Federation of California.

TESTIMONY OF JAMES SNYDER, PRESIDENT, PERSONAL INSURANCE FEDERATION OF CALIFORNIA, WASHINGTON, DC

Mr. SNYDER. Chairman Anderson, Members of the subcommittee, my name is Jim Snyder. I am president of the Personal Insurance Federation of California and I am please to appear before you today in behalf of America's Coalition for Transit NOW. Tom Conneely unfortunately can not be with us today but I am happy to report to you that the testimony that I shall offer is fully supported and endorsed by Mr. Conneely and his association of California Insurance Companies. Together our two organizations represent eight of the top 10 companies writing automobile insurance in California and 65 percent of the personalized market.

As many have observed, Transit NOW is a very unusual array of interests. We have come together to support a major increase in federal funding for public transportation. The diversity of Transit NOW's membership demonstrates the breadth of benefits that expanded and improved transit systems and services offer for all Americans.

Too often, Americans think of transit as the other way people get around, if they think of it at all. But as each of us confronts increasing problems of mobility, congestion, dirty air and inefficient land use, declining productivity and growing reliance on imported oil, we must come to see that public transportation offers solutions to each of these problems.

I will touch briefly on each of these points and then more specifically address the benefits the transit offers to control the cost of insurance.

Everywhere, congestion is a major cause of declining economic productivity. Nationally—and I should point out a typo in the prepared text here, lest you think we are prone to hyperbole—nationally 2 billion hours are wasted each year while we sit in traffic. In the next 20 years, urban and suburban travel is projected to increase by 400 percent on the nation's freeways, and by 200 percent on other roads.

And as congestion diminishes our productivity, our economic competitors are making massive investments in their transportation infrastructure:

Spain is investing $22 billion to rebuild its national rail network.

West Germany is investing $12 billion to build an intercity high-speed rail network.

Scandinavian countries are building Scanlink at a cost of $6 billion to connect Scandinavian rail and road systems to the rest of Europe.

Switzerland is spending $8 billion to build trans-Alpine rail tunnels to Italy and an additional $5 billion on a new rail and bus network.

The British and French are building the Channel Tunnel at a cost of $12 billion to accommodate 80 mile per hour rail traffic.

The French high-speed rail network is being expanded to Lille and Calais tying France, and all of Europe, into a network which will include Brussels, Amsterdam, Cologne and London.

These figures are just for the emerging European Community. Japan's bullet trains are legend, and they, too, are being expanded and improved.

The United States is the world's leading debtor nation. A major contributor to our trade imbalance is the growth in oil imports. In January 1990, 54 percent of the nation's oil supply was imported. The impact on our balance of trade is substantial. The Department of Energy recently reported that in the first 11 months of 1989, the cost of imported energy, nearly all oil, represented 38.5 percent of the $102.4 billion trade deficit in those months. Transportation accounts for 65 percent of petroleum use. Reducing the use of oil products for transportation by increasing the use of shared ride modes of transportation will result in a decline in the demand for imported oil. For instance, 30 million to 40 million gallons of gasoline would be saved each day if average commuter vehicle occupan-

cy were increased from 1.1 passengers per vehicle to 2.1 passengers per vehicle.

Mr. Chairman we can not continue down this road.

Similarly, the quality of our air has declined in virtually every community. As a result, our environment and our health have suffered. It is well documented that the major source of air pollution is motor vehicles.

One third of carbon dioxide, the most significant cause of global warming, comes from transportation sources.

Transportation sources cause 40 to 60 percent of pollution that produces ozone. Ozone standards were violated regularly in more than 100 U.S. cities in recent years.

Transportation also accounts for 70 to 80 percent of carbon monoxide emissions, with those standards being exceeded in 44 metropolitan areas.

A consequence of this motor vehicle pollution is that 110 million Americans are breathing dirty air according to the Federal Environmental Protection Agency and the cost to our health is staggering, with over $40 billion spent on air pollution related illnesses each year. And the American Lung Association reports that auto pollution is a major factor of the deaths of 110,000 people annually.

Mr. Chairman, we can not continue down this road.

We all hope that the soon to be enacted Clean Air Act will improve our air quality. But even these efforts will not be enough. Integral to our nation's efforts to clean the air must be a renewed commitment to making public transit available to all Americans, to offering meaningful transit choices other than one person per car.

Economic competitiveness and air quality are not the only reasons America needs an improved public transportation system.

For 65 million transportation disadvantaged Americans, people with disabilities, old Americans and rural residents in particular, our under-funded transit system has meant less mobility and fewer opportunities to contribute to society and maintain their independence. Limited public transit also condemns many rural communities to slow economic death.

In recent years the high cost of auto insurance in some of our urban ares has become a major political issue. Nowhere is that more true than it has been in California during the past year. Where auto insurers are confronted with more claims and skyrocketing medical and legal and auto repair bills and that is compounded by an unprecedented consumer anger and frustration with the consequences of the increasing frequency of automobile accidents on the price of car insurance.

Urban areas often face the most severe problems, largely due to congestion, higher accident rates, and higher costs associated with those loses.

A recent study by the Insurance Services Office and the National Association of Independent Insurers, entitled "Factors Affecting Urban Auto Insurance Costs", found that bodily injury liability claims in Los Angeles occurred 2.4 times more frequently than in the State of California as a whole. Similar rates of frequency are being experienced in Philadelphia, Baltimore, Newark, Boston, Chicago, Cleveland, Miami and New York City.

Insurance statistics are very clear. Increased congestion leads to greater insured losses and higher auto insurance rates. However, the insurance industry is not satisfied to simply note this phenomenon and pass the cost on to consumers in the form of higher insurance rates. We are engaged in a variety of efforts to make our roads and cars safer, to reduce drunk driving and to lower the cost of repair.

Greater use of mass transit and improved mass transportation systems will lead to a reduction in congestion and ultimately to fewer accidents, injuries and fatalities. Insurers have a vested interest in these issues and will continue to work with organizations with similar goals such as those in Transit NOW. We are proud to join with business, labor and consumers in urging increased funding for mass transit.

We need more effective public transportation and greater education on public transportation services to reduce traffic injuries and deaths, for a cleaner environment, for the economy and for insurance consumers.

Mr. Chairman, recently the voters of California approved three ballot initiatives which authorized billions of dollars to be invested in new mass transit infrastructure. In recent years many other states have also invested in the improvement and expansion of the public transit systems and services. And now it is time for the Federal Government to follow the lead of the states and not only be a rhetorical partner but a fiscal partner in revitalizing our nations public transit systems. The members of the Transit NOW Coalition and the insurance organizations I represent urge you and your colleagues to lay the public policy ground work for transit into the 21st Century.

Mr. Chairman, thank you for the opportunity to appear before your committee and I will be happy to try and answer any questions you might have.

Mr. MINETA. Thank you, Mr. Snyder. Chairman Anderson?

Mr. ANDERSON. Thank you, Mr. Chairman. Mr. Snyder, no one will dispute the many positive effects that mass transit has on reducing congestion, improving air quality and reducing our reliance on imported oil. However, most Americans even in urban areas, continue to rely on the personal automobile for transportation. Now what are the Coalition's plans for succeeding in changing the basic attitudes of many Americans who resist personal use of mass transit?

Mr. SNYDER. Chairman Anderson, the members of the Coalition very clearly acknowledge and recognize the tendencies that you just cited and that is one of the reasons that we believe that education about the benefits and efficiencies of public transportation are also a vital component involved with providing those services. We think that people's habits can be changed as it becomes apparent that it is more cost effective, more convenient, safer, cleaner and cheaper to use public transportation.

Mr. ANDERSON. Without improved ridership in all transit modes across the country, how will increased federal funding for transit programs help to reduce congestion? Without improved ridership in all—in other words we have got to get them—without improved ridership in all transit modes across the country, how will in-

38-253 O—91——67

creased federal funding for transit programs help to reduce congestion?

Mr. SNYDER. Chairman Anderson, very simply by making the quality of the services that are available sufficiently better to entice greater use of those facilities.

Mr. ANDERSON. Get them out of their cars into the transit?

Mr. SNYDER. Yes, sir.

Mr. ANDERSON. Thank you, Mr. Chairman.

Mr. MINETA. Thank you. Mr. Snyder, my own background is fire and casualty, having had an insurance agency so I am very interested in terms of what your Coalition is pushing for. You state that increased congestion results in a higher percentage of bodily injury liability claims. And I am wondering, is this simply a result of more vehicles being on the road even though they are traveling at slower speeds?

Mr. SNYDER. More people driving more miles running into each other more often and unfortunately demonstrating a great proclivity for suing one another when they do.

Mr. MINETA. And have higher bodily injury claims occurred more frequently in urban areas in relation to HOV, Higher Occupancy Vehicles, as well as cars with one or two occupants?

Mr. SNYDER. Chairman Mineta, I am not sure with respect to the HOV vehicles. We do know that there is a striking difference in the frequency of bodily injury claims being made in urban areas compared with suburban or rural areas based upon the number of miles driven in the vehicles on the road.

Mr. MINETA. Mr. Hastert.

Well, Mr. Snyder, thank you very, very much for your presentation here today.

Mr. SNYDER. Thank you, Mr. Chairman.

Mr. MINETA. I would like to call on Ray Remy, the President of the Los Angeles area Chamber of Commerce.

TESTIMONY OF RAY REMY, PRESIDENT, LOS ANGELES CHAMBER OF COMMERCE, LOS ANGELES, CA, ACCOMPANIED BY ROB CURTIS

Mr. REMY. Thank you, Mr. Chairman, Chairman Anderson, Congressman Hastert. With me is Rob Curtis who is an associate of mine at the Chamber of Commerce and we are pleased to have an opportunity to appear before you. I will not read my testimony but merely cover a few points relative to the business community and its support for public transportation and investment in our streets and roads.

The business community, through the Los Angeles area Chamber and also statewide are strong supporters of Prop 108 and 111. They served as some of the principal people who pushed for those measures to be placed on the ballot and served as one of the principal spokepersons and principal people on the campaign to get them approved. We are pleased in Los Angeles that the Chamber of Commerce was the co-chair for that particular campaign in this county and we served as election night headquarters for the passage of those two measures. So I think the commitment for transportation has been very strong. We have also served as part of the Transpor-

tation Coalition which is a public private partnership here in this county bring together the private sector in, the public sector on matters of transportation and of course have had the opportunity of testifying before your committees during the course of the years in support of transportation measures.

We recognize, as speakers have said to you throughout the course of the day, that the various economic fabrics of southern California if not the state depends upon a good transportation infrastructure. If you cannot move goods and people in this region you will not have an economic base to support our systems of public and private service. We have a huge economy in southern California and we have a huge population that needs to be served and indeed if we are stuck in traffic as Neil Peterson commented about the declining road speed on our freeway systems and our city streets and county roads, our congestion problems, that that investment will begin to dry up and go elsewhere, and the population that is here will be left a most dismal economic future so the investments are absolutely essential. International trade and commerce is of vital importance to southern California and indeed that too is greatly assisted by having good goods movement and good people movement throughout this basin.

Air quality as been mentioned and you obviously need a sound transportation system to deal with the air quality issues. A source of interest as well as concern to the business community is to assure, however, that air quality be not the only driving force in development in transportation policy but rather that it be done jointly between air quality interests and transportation interests to complement each other without one having a dominate role over the other which has often been expressed as a concern.

We feel in California that we have risen to the challenge of Secretary Skinner when he asked that states step forward to put additional funds into their system, and as it has been commented by a number of people who testified today, not only do we have the local sales tax measures but we have the recently passed gas tax measure and we now feel it is time for the administration in Congress to fulfill their commitment to also put monies into our systems that will help us to move the people and the goods.

We have a series of recommendations which I have noted and we feel that there must be reauthorization of the gasoline tax. We feel that gasoline tax should be spent for transportation purposes and not for deficit reduction. We have supported Congressman Anderson's resolution to that affect saying that we need that as a user tax to move the people of this country.

We feel that the current planning process that is built on a local planning process through county commissions, through metropolitan planning agencies and to a state transportation improvement program is a sound one. We think that those sorts of systems work provided that there is adequate flexibility in being able to make choices in metropolitan areas on the investment of your transportation dollars.

We urge that the trust funds be spent down and that those funds which were legitimately raised for transportation purposes indeed should be spent for those purposes and not held for budget balancing purposes.

As has been consistent in the past, the Los Angeles Area Chamber of Commerce and Transportation Coalition and others, look forward to working with this committee and with the Public Works Committee generally in the support of a Surface Transportation Reauthorization Act in Congress next year and you can certainly count on our vigorous support from the private sector in pursuing that end.

I would be happy to answer any questions and apologize for not sticking strictly to the script but I hopefully covered a few points.

Mr. MINETA. Chairman Anderson.

Mr. ANDERSON. Thank you, Mr. Chairman. First welcoming you, Ray, I just to commend you for all your efforts both as Tom Bradley's deputy mayor and in recent years with the Los Angeles Chamber of Commerce and improving local transportation. So I just to say want to say, good.

Mr. REMY. Thank you, Congressman.

Mr. ANDERSON. Now my first question is, does the Los Angeles Chamber of Commerce support increasing the degree of private sector funding of highways through the increased use of tolls?

Mr. REMY. We have not taken a position on the toll legislation when it came through. It is a demonstration project in Orange County. I think historically we have not supported tolls and toll roads in California. We do and have supported joint development. We have supported a variety of increased fees, transportation linkage fees for congestion relief. We have supported Richard Katz's bill that dealt with congestion management and linking it back to development generally.

The concept of toll roads side by side with gas tax may be somewhat inconsistent and while we support it on bridges, we have not supported the Orange County effort.

Mr. ANDERSON. I had kind of an interesting situation on that where I believe there were five or six states that asked us to change the law so they could do tolls and they—and then I know the secretary of transportation said in addition to the five or six local states, he and then later she wanted to add one or two more so I think it was up to seven and we had a rather unusual situation in California where you know most of us years ago kind of said we do not want any of your tolls in California. Then of course the Federal Government had somewhat the same thing and there has been a change back because we are running out of money everywhere and the local areas need it to be able to—they just cannot all go out and put gasoline taxes on or whatever it is to raise it, so they wanted to put the tolls on so we had them—Orange County where they had come up and said they wanted that before we would even move then we got the signed statement of every member of the board of supervisors, then we got every Congressman. I think there was whatever, five or six Congressmen. They all had to see it to show that it was Orange County and then we passed it limiting it to just Orange County because they needed the money to be able to match as their share. And it was kind of an unusual thing but it is also going to be watched because I know in the case of Orange County they are using—it is going to be developing some areas that—they would not be developed unless they had the highways in

there. And so we have got to have the toll road to get them the access to get the highways in. It was kind of a difficult one.

Now similarly would you support the use of special assessment districts and related value capture mechanisms to fund the construction of transit capital improvements? In other words, do you have any suggestion as to how we might amend the federal current transit programs to increase the private financial role? And they need that somehow.

Mr. REMY. Well I think that the extent that legislation gives states the ability and flexibility to have creative ways for financing is appropriate. I am not sure that you want to prescribe at the federal level techniques that have to be adopted. I would leave that to the states for their judgment.

Mr. ANDERSON. That is what we did. We left that to them, yes.

Mr. REMY. And I think that is the appropriate area. Clearly on joint development, particularly joint development for capital construction facilities and stations to me is quite appropriate and we have supported that. We have supported historically the benefit assessment which was part of the metro rail funding package. As Dick Patsaouras commented, that particular measure has been tied up in terms of litigation. But benefit assessment is another form by which the private property owner can participate in the construction.

The transportation linkage fees which have become more and more prominent for developers in California are another method by which the private sector participates, although I think we have reached the point where we have used linkage fees to the point of abuse. And if we continue to have those many linkage fees and other sorts of assessments on the property for developers, we just drive up the price of the property so high a majority of our population cannot afford the housing and shelter. So I think it has to be done with some judicious judgments. And in California I think we passed that point in increasing the cost of residential construction beyond what we ought to have in our state.

Mr. MINETA. Thank you very much, Mr. Chairman. I have no further questions. Mr. Hastert.

Mr. HASTERT. I just want to thank you again, as the Chairman has, for the leadership that you have brought to transportation issues on behalf of the Los Angeles Chamber of Commerce and I just want to thank you very, very much for your efforts.

Mr. REMY. Well, thank you very much, Norm. We would not have had the progress if it had not been or you and Glenn and members of your committee. We would not have a metro rail, we would not have the support that we have had and indeed our thanks are in the other direction.

Mr. MINETA. Thanks, Mr. Remy. Mr. Curtis, thanks very, very much. Now I would like to call on Mr. Jim Sims the president of the Community Transportation Services, Inc.

TESTIMONY OF JIM SIMS, PRESIDENT OF COMMUTER TRANSPORTATION SERVICES, INC.

Mr. SIMS. Thank you very much, Mr. Chairman, Members of the committee. For those of you who may not know, Commuter Trans-

portation Services is the nation's oldest and largest commute management agency. We are non-profit. We were founded in 1974 in the midst of the energy crisis in order to help commuters find a better way to get back and forth to work.

I came here today with the objective in mind of making the case for Transportation Demand Management, or TDM, as an important part of the package along with capital improvements, along with Transportation Systems Management; the package which is necessary in order to solve our nation's transportation problems. Luckily for me, nearly every speaker who has preceded me has already made that case so I would just like to hit on a few high points of what I intended to say.

By Transportation Demand Management, I think we mean three things.

First of course is increasing vehicle occupancy. Getting more people into the car pools and van pools.

Secondly, of course increasing the use of public transit.

Thirdly by decreasing the need to commute by convincing businesses to go on four day work weeks, flex time, work at home programs, biking and also walking to work.

We think that TDM is very cost effective; our annual budget this year for example is about $6.5 million. For that amount of money we will place 45,000 people who were riding alone in their own car into car pools, van pools and public transit. Those 45,000 people for example will reduce the number of vehicle trips on the system by about 19 million over a year's time and would reduce VMT, the total Vehicle Miles Traveled, by over 150 million during the course of a year.

TDM also makes a major contribution toward improving the air quality. As noted the 45,000 people we placed in ride sharing resulted in a 15,000 ton per year reduction in air pollution at a cost of about $400 per ton. Just to give you some perspective, it costs industry in the south coast air quality district about $4,000 per ton to reduce pollution. So if you can reduce it by $400 a ton you are making a pretty good buy.

Also TDM, by avoiding trips and reducing the number of trips, will reduce wear and tear on the system and really it is focused toward making better use of our existing system rather than adding new portions to it.

We have three recommendations. The first one is that we believe that the Surface Transportation Act should explicitly recognize TDM as part of the package which is the main point I want to make. In addition to capacity improvements and TSM.

Secondly, we think that highway funds and transit funds should be made available for Demand Management Programs on the same basis as other programs, especially in terms of the match. Neil Peterson was speaking earlier and he noted that if the matching basis is the same, that leave local officials the option to pick what is best and what works rather than which is the best deal in terms of getting the most federal bucks.

And lastly I think we would recommend to you in terms of a recommendation that the package include some research dollars for the area of TDM or Transportation Demand Management. We spend a lot of money on research, on thickness of pavements and

on transit. I think we need to look at Transportation Demand Management and try to get some answers to some of the tough questions about how much does it cost, how much difference will it really make. We believe it makes a big difference but I think our case will be strengthened if we had the ability to perform appropriate research and get those answers.

And lastly, not in my prepared remarks but something which I think we should touch on is that no transportation strategy is going to be complete unless we address tax equity issues. As all of you already know—some of you are cosponsors on the Congressman Matsui's bill—that we have, for example, in some cases employees in Los Angeles who receive up to $200 a month subsidy tax free for parking because they receive free parking. At the same time, the most that an employer can offer to an individual in terms of a transit subsidy is $15 without it being taxed. Above that the whole amount is taxed.

And I might point out also, that there is no provision at all for a tax free subsidy for ride sharing and for car pools and van pools which are another method of reducing trips on the system. Historically, the Highway Act, the Surface Transportation Act, has sort of given our nation a vision of what the transportation system and the transportation future ought to be and we hope and trust that this next act will do the same. We think the time has come for Transportation Demand Management to be a part of that package.

I would be happy to answer any questions you may have.

Mr. MINETA. Thank you, Mr. Sims. Chairman Anderson.

Mr. ANDERSON. Thank you, Mr. Chairman. Jim during your years with the LACTC you did such a great job and you worked so closely with us that I know you will be doing a terrific job for the Commuter CTC, so again I just want to congratulate you on what you did in the past.

Now my first question as you specifically request that Federal Surface Transportation Assistance Act be amended to set aside some amount of funds for research to evaluate transportation demand, management strategies as far as their effectiveness and to adapt them to different local needs. Now how much funding do you believe is needed annually on a national basis and will those research dollars be best met on in-house studies? Or outside contracts with public and private entities? Or some combination of the two.

Mr. SIMS. I think some combination of the two. First, your first question was how much money. I do not think we are talking about a lot of dollars here. I think we are talking about certainly less than $5 million nationwide would be adequate to fund a generous program in research and development. I do not think that this should all be done in-house with the DOT or with other federal agencies. I believe that you need to bring in the expertise of other people on the outside. I think you have to recognize also we are bringing a different partner to the table when we talk about transportation demand management. We are talking about bringing employers to the table as part of this program so I think that you need to include employers and employer representatives, perhaps Chambers of Commerce, or employee groups as a funding partner on a matching basis with this research and development program.

Certainly you need to bring in these agencies and these companies to help you fashion the right program.

Mr. ANDERSON. You speak to the need of making federal highway funds available for Demand Management programs. It is my understanding that federal funds can already be used for quite a few of the Transportation Demand Management strategies which you name in your testimony including HOV lanes, park and ride lots and organizing van pools. Would you please spell out for us precisely which TDM activities are not currently eligible for federal aid highway assistance and which ones you think should be made eligible for funding in our new legislation?

Mr. SIMS. Well specifically, let me use an example. We have an area of north Los Angeles County which you are familiar with, the Palmdale, Lancaster, Santa Clarita area, served by only one major highway. That major highway certainly needs to be improved and the cost of improving that highway is going to be tremendous but we think that as part of the package, we should include, for example, van pool subsidies as part of the package of providing the transportation in that corridor. Now van pool subsidies are now eligible for highway funding specifically related to a construction project, but we think a more general application of van pool subsidies for example where it can be proved, where it can be shown that it is a cost effective way of dealing with a specific transportation problem. We think for example van pools and either capital costs or some other subsidy related to van pools should be a part of the program.

Mr. MINETA. Just out of curiosity, Mr. Sims, on page one of your testimony with you are talking about the three ways to deal with TDM by increasing vehicle occupancy by increasing use of public transit, and by decreasing the need to commute, in that laundry list of things that are—you do not include zoning or land use. Is that something that CTS gets involved in in anyway?

Mr. SIMS. No, not directly, we are not involved in the land use zoning issues except to the extent that we work with developers as they are planning new developments and work with the cities as they develop and grow to try to help them design their developments such that they are transit friendly, if you will, or ride share friendly. But we are not directly involved in land use issues.

Mr. MINETA. I wonder if the old traditional ways of commercial over here, residential over here and industrial over here, if that is not really contributing to and perpetuating this whole need for the kind of long commutes that we have and whether or not we ought not to be getting into the old mixed used use where you had your store downstairs and you lived upstairs.

Mr. SIMS. I think you are right. Prior to working with the LACTC, I was with the Southern California Association of Governments, SCAG, and one of the policies we developed while I was there, one of the concepts, was job housing balance. Trying to get a better balance so that people did not have to drive so far—get in the car, for example, to go buy a loaf of bread. That those kinds of uses were mixed and closer together. I think there is a lot that needs to be done in that area but I would have to say that I believe that the local areas should work out these kinds of transportation housing issues.

In Prop 111 which you are familiar with, it requires localities to develop a congestion management plan and that congestion management plan specifically requires that air quality, land use, and transportation issues be linked into the development or else in the case of Prop 111 cities can forego their gas tax funds.

Mr. MINETA. Mr. Hastert.

Mr. HASTERT. Thank you, Mr. Chairman. You note in your statement that suburb to suburb commuting makes up a major portion of commuter vehicle miles traveled and that Demand Management Strategy can more effectively or efficiently serve these commuters needs. Would you please detail for us the kinds of transportation Demand Management programs CTS is using or would use to reduce the VMT and congestion for intersuburb commuting?

Mr. SIMS. We have in this county and the other counties we serve, several major developments where we will go in and we will survey all employees that work there. We produce then what is called a density map—and I am giving this a mechanical approach—a density map which identifies where each of these employees lives in the whole southern California region.

What we find, is we look for clusters and we look for the routes which these people carry and many times you have a cluster of only two or three or half a dozen people. Okay, with a small cluster, say located five to seven miles away, you could put together a car pool. With a larger cluster located maybe 10, 12 miles away, you could put together van pools.

What I am saying, it is easier in many cases to put together a car pool or a van pool program for these various clusters because they are so small than it is to put together say a fixed route transit system.

Mr. HASTERT. While I am picking your brain——

Mr. SIMS. Maybe I missed your question?

Mr. HASTERT. No, no, it is fine. A little bit here—we have a unique situation from the metro area that I represent, probably different from here. You have always had pockets of where people live and where people work, but we see more and more large entities, such as Sears and Roebuck moving out of the Loop in Chicago and into the suburbs and how do you move the people around. We have our commuter lines that run from suburbs into the city and so it is interesting to see how you start to develop those plans because I think we will probably be doing the very same thing very soon.

Let me ask you a question. How do you finance your ability to do that? You are a non-profit organization.

Mr. SIMS. We are non-profit. We are principally publicly funded. Our funds come through Caltrans, through the four counties that we serve and some private contributions. Primarily, we are publicly funded.

Mr. HASTERT. All right. Thank you. Thank you, Mr. Chairman.

Mr. MINETA. Thank you very, very much, Mr. Sims for sharing with us CTS's experience. I appreciate it very much. At this time I would like to call on Jerald G. Geismar, Vice-president, General Manager, TRW General Services Division and Chairman of the Board of the El Segundo Employers Association.

TESTIMONY OF JERALD G. GEISMAR, VICE PRESIDENT, GENERAL MANAGER, TRW GENERAL SERVICES DIVISION, AND CHAIRMAN OF THE BOARD OF THE EL SEGUNDO EMPLOYERS ASSOCIATION, EL SEGUNDO, CA

Mr. GEISMAR. Good afternoon, Mr. Chairman and Members of the committee. You already introduced me so I do not have to reintroduce myself. The El Segundo Employers Association, ESEA, is a privately funded non-profit coalition of aerospace and defense contractors and other major employers and commercial property owners.

ESEA members, who employ more than 75,000 people in the south bay area of Los Angeles County alone, include, among others, TRW, Hughes, Rockwell, Northrop, Xerox, Computer Sciences, and Chevron U.S.A. Since its founding in 1981, ESEA's sole mission has been to help improve the transportation system and to reduce traffic congestion in our area. As such, we are vitally interested in the future of the federal highway and mass transit programs, and welcome this opportunity to share our views in regard to what we consider to be one of our most important issues: good intermodal access, especially as it relates to ports of national and regional significance.

First, however, I would like to spend just a few moments telling you about ESEA's approach to our surface transportation problems.

We were perhaps the first transportation management association in California, if not in the United States. Almost a decade ago, we were founded. ESEA members began to develop and implement demand management strategies such as van pooling, car pooling, employer subsidized public transit and alternative work schedules. Long before the term public/private partnership became commonplace, we recognized that the private sector has the ability, the opportunity and indeed the responsibility to help address our transportation problems.

Today, ESEA members are continuing and increasing these efforts to help achieve critical mobility and air quality objectives for our area. At the same time, ESEA believes that demand management strategies cannot do the job alone. Public investment and transportation infrastructure at all levels of government must be in line with the needs of today and tomorrow.

This constitutes the other part of our overall approach: advocating capacity enhancements on a selective basis to reduce congestion and enhance the south bay as place to work, live and do business. ESEA continues to advocate a multimodal approach. Ride sharing, HOV lanes, rail transit, intersection improvements, and arterial widenings are all integral to our philosophy and strategy.

I have with me copies of ESEA brochure which summarizes our approach and accomplishments which I will make available to you.

We have long recognized that a good transportation system is critical if American business is to meet the challenges of the global market place. One issue which we think deserves special attention is the need to insure good intermodal access to airports and seaports. When trips involve transfers from one form of transportation to another, good connections between modes are essential. There is

an important and legitimate role for the Federal Government to play with regards to this issue, since intermodal access projects tend to be complex, costly, and beyond the financial resources which are normally available to state and local jurisdictions.

Here locally, for example, the new interstate I-105 Anderson freeway will be completed in three or four years, and will terminate just south of the Los Angeles International airport. The key link between the freeway and the airport is a tunnel on a local arterial. Studies have shown that this link will be massively overloaded once the freeway is in operation.

ESEA believes this is an excellent example of where the Federal Government can and should play an important role. The cost of expanding the tunnel is simply beyond the reach of State and local government even with the passage of Proposition 111.

It should also be remembered that LAX is in the middle of one of the most highly developed and growing corridors in Los Angeles County. Good surface access is important, not only to the over 40 million annual passengers who use LAX and for the billion of dollars worth of freight which are imported and exported there every year, but also for the hundreds and thousands of daily commuters in the area who must use the same congested corridor to get to work.

The irony is that completion of a portion of the federal interstate system will make access to LAX worse, not better, and will negatively impact area commuters as well. While the particulars may differ, my impression from traveling throughout the United States is that this is hardly a unique example but rather one which is typical of an entire genre.

As we move into the post-interstate area, ESEA recognizes that roles and responsibilities of all levels of government and the private sector in regard to transportation may be changing. We also recognize that budgetary considerations play a role as well. We believe, however, that it is appropriate for Congress and the administration to take the lead when national interests are clearly at stake, when the need—in this case good intermodal connections—is nationwide in scope, when the solution is beyond the financial capacity of local and state governments, and when other federal programs or projects have significant or unintended adverse impacts.

Thank you very much for your time and attention. I would be happy to answer any questions you may have.

Mr. MINETA. Chairman Anderson.

Mr. ANDERSON. Thank you, Mr. Chairman. Yes, Mr. Geismar, I have a couple of questions relating to your concern about the connection between the I-105 and LAX. Now surely completion of the freeway will improve access in the transportation corridor. Can you explain how you think that that access to the airport will be worse and what is the cost of the tunnel expansion that you were seeking? That is my first question.

Mr. GEISMAR. Okay, I guess the reason for the access to the airport being worse is that the tunnel which is a limited single access from the off ramps from the new freeway will be flooded, not only with the traffic coming from the local area as normally, but with the additional traffic that is essentially dumped down right at that

point and if it is heading to the airport, it is mixing in with a very heavy traffic flow that exists there already.

Secondly, the second part of your question in terms of the cost, I think you are well aware that we are undergoing a preliminary engineering and environmental clearance study right now. You helped obtain funds for that for us. $3 million matches 2.4 federal and 600,000 local match to try and come up with a better estimate and a better understanding of what the cost will be. If I were to hazard a guess it could run as high as $75 to $100 million. It is a very complex—would be a very complex project.

Mr. ANDERSON. It is a tough one for me. Back when we first built the airport—they were going to the present tunneling that is now currently—they were going to have just a one lane tunnel. And I was in assembly at that time and Assemblyman Vince Thomas who was from—as a matter of fact he was an assemblyman of where I live now, he and I joined together and we fought the program to try to get the additional lanes that are there today and of course, you are absolutely right, even today the tunnel as wide as it is and it is two to three times what it would have been. It is still is congested at certain times and I would hope that they have thought about—I think there are other ways to get into LAX area from—two or three different ways of getting in and I hoped that they—that it was not going to be that bad but I will—when I leave here I am going to check on your figures a little bit to make sure that maybe there is something we can do.

I could not agree more on your view that intermodal access to airports and ports is essential to our position in the global economy. In your view though, what projects in southern California are most needed in that regard?

Mr. GEISMAR. I guess I am really not qualified to speak beyond the particular area that I am familiar in. The association that I am chairman of and very actively involved in involves the area south of the airport. El Segundo and the employment areas surrounding that. This is the major concern of our organization and of our employers.

Mr. ANDERSON. The last time your organization contacted, which was a couple two or three weeks ago, it was to access from LAX to the port area and you were at that time worried about crossing at Rosecrans and Artesia, I think.

Mr. GEISMAR. Well we have Rosecrans in Aviation.

Mr. ANDERSON. It was Rosecrans and Aviation, yes.

Mr. GEISMAR. That is not directly access to the airport but it certainly——

Mr. ANDERSON. It was access to the ports and to the airport from going that way, yes.

Mr. GEISMAR. Yeah, I had not considered that in the same light, but you are absolutely right.

Mr. ANDERSON. Thank you, Mr. Chairman.

Mr. MINETA. I am very pleased to see your executive director here as well. One of the top people, Don Camph. Don, it is good to have you here and see you here. Let me ask—in terms of the people who are within your employers association, have you ever figured out, oh let us say the vehicle miles traveled in terms of

where they live, where they are going to, what that total VMT might be just of the people within your association.

Mr. GEISMAR. Don might.

Mr. MINETA. Or—okay then, let me go to the next step. To what extent have the kinds of things that you have done in terms of arranging car pools, van pooling other kinds of programs reduced the number of trips and eliminated or reduced that vehicle miles traveled?

Mr. GEISMAR. Well we have varied records with successes with some of the companies. My particular company has only been active in promoting ride-sharing and van pooling for the past two years. And my organization happens to be responsible for that and it is a very difficult subject to tackle. It has been mentioned here earlier that to create a change in the habits of the driving public is very difficult. We are working on that by providing incentives. We saw in the last year some small amounts of improvement in the average vehicle ridership and we continuing by increasing the incentives offered by the employers to try and encourage that shift plus a lot of PR. Some other companies in the area, Northrop, and Aerospace Corporation have been at it much longer and have been quite successful. And, in fact, they have riderships that are up in the range of one and one-half, which is the AQMD target. So the successes vary amongst the companies, but now I can tell you that all of the companies are very active in it. Of course, Rule 15 of the AQMD has forced us to be, but we are all taking that very seriously and working very hard at it.

Mr. MINETA. You say that of the companies who are participating in ESEA that there is a total of 75,000 employees, how many are participating in some form of ride sharing, car pooling, any idea there again?

Mr. GEISMAR. I do not have those statistics.

Mr. MINETA. Okay, that is fine——

Mr. GEISMAR. I can tell you that in my own company of about 16,000 employees in the area, we have something in the order of 2000 to 2500 participating in some form of car pooling, van pooling, bike riding, walking to work, bus riding.

Mr. MINETA. Where do you think—what is it further that we could be doing from a federal prospective in terms of the reauthorization of this highway mass transit bill that would help your members cut down the use of their car, in a congested urban area like this?

Mr. GEISMAR. I think you have heard some of the suggestions before. HOV lanes, are very important. Tax benefits to help participants in van pools or to help the financing of van pools. Things of that nature.

Mr. MINETA. Mr. Hastert.

Mr. HASTERT. One of the things that has been talked about and maybe something in your realm, is telecommuting, otherwise a work station at home. Certainly in this realm of the next decade that could be a very possible thing, even today it could be a possible thing. Is that something your company would encourage to decrease congestion and work related trips?

Mr. GEISMAR. We have appropriate, yes, except we face a very difficult situation and I do not think you want to get into it, but it

has to do with being in the government business, doing work for the Federal Government. The rules about keeping track of your time and how you charge your time to government business are very rigorous and strict and it requires some changes and some relaxation in those rules to make it more feasible in terms of legitimate ways for us to do our government business. But we certainly in selected areas would be able to take advantage of that.

Mr. HASTERT. So you are saying that because of government bureaucracy or government rules and regs we make it almost impossible for you to be cost-effective?

Mr. GEISMAR. It is very difficult. The rules are you are supposed to be at work, if you are charging to the government. How does someone know how many hours you are working when you are at home, etc, etc, etc,. It is tough to audit and so that presents a problem.

Mr. HASTERT. Realistically, is there a problem for business to really supervise its people in that telecommunicating situation?

Mr. GEISMAR. I do not think that is the problem. I know companies who are not subject to those rules are working on that more so than we are.

Mr. HASTERT. Again, thank you very much. Thank you, Mr. Chairman.

Mr. MINETA. Mr. Geismar, let me thank you very much for your testimony and also to thank you for being so generous in allowing Mr. Camph being able to be with the Department of Transportation in his very important role as advisor to the secretary as we put together this new bill so we appreciate very much the time that you have allowed him to leave ESEA to do his work in DC. Thank you very much.

Now I would like to call on Donald R. Prescott, Plant Superintendent Facility Operations McDonald Douglas Corporation and Chairman of the Board of the Long Beach Airport Area Traffic Reduction Association. That title is longer than the testimony. Mr. Prescott, your testimony will be made a part of the record and if you go ahead and proceed in your own fashion.

TESTIMONY OF DONALD R. PRESCOTT, PLANT SUPERINTENDENT, FACILITY OPERATIONS McDONNELL DOUGLAS CORP., AND CHAIRMAN OF THE BOARD OF THE LONG BEACH AIRPORT AREA TRAFFIC REDUCTION ASSOCIATION, LONG BEACH, CA

Mr. PRESCOTT. Well, as Chairman of the Board of Directors of the Long Beach Airport Area Traffic Reduction Association, I would like to speak on behalf of that association and thank you for the opportunity to address the committee on the Reauthorization of the Federal Surface Transportation Program.

I recognize that the hour is late and the committee has listened to a great number of individuals and organizations today so I will attempt to be concise concerning my purpose here today.

However, I would be remiss if I did not recognize and welcome Congressman Anderson who has been extremely helpful and sympathetic to the past and present transportation needs in Long Beach.

Currently the Long Beach Airport Area Traffic Reduction Association is working toward solving the increasing transportation needs in and around the Long Beach Airport. Founded in 1989, the Association is a non-profit organization of employers and commercial property owners located at or near the Long Beach Airport.

The Association is actively pursuing a comprehensive program of transportation demand management strategies which will require a considerable amount of marketing and persuasion of employers and employees to change their existing commuting habits. We are making a considerable commitment in this regard and will continue to shoulder these kinds of responsibilities. The many commute alternatives which the Association advocates, including the car and van pooling, alternate work schedules, telecommuting which we discussed a little earlier and public transit will help achieve both the transportation and air quality objectives.

We believe that in the post-interstate era, federal surface transportation programs for urban/suburban mobility and intermodal access should be on a par with reserving the integrity of the nation's Interstate System. The economic health, vitality and competitiveness of our nation is being threatened by increasing congestion and a failure to meet the access needs of critical intermodal facilities. Typically, as is the case here in Long Beach, these facilities can have significant negative impacts on daily commuters, our neighbors, our businesses as well as the intermodal facilities themselves. To maintain the nation's economic competitiveness, we need a national transportation program that recognizes and funds urban and suburban mobility programs and intermodal access.

In the Long Beach area, we are blessed with two significant port facilities, namely, the Port of Long Beach and the Long Beach Airport. At the airport, we are concerned about insuring good access. To this end, the association's members have entered into a partnership with the city of Long Beach to develop and help fund a program of surface transportation improvements which will reduce peak period congestion in the area and insure a continued ease of access to the airport.

To date, our members have committed over $7 million to help finance these improvements in the vicinity of the airport. At the same time, a number of airport related highway projects remain beyond the ability of the private sector or for that matter, the city of Long Beach, to fund. Considering the commitment by the city of Long Beach and the recent significant private sector participation in improving access in and about the Long Beach Airport area, we strongly believe that the Congress and the Administration should be more active in finding solutions to congestion and access needs related to ports located in urbanized areas. We recommend that the committee seriously consider providing significant increases to urban surface transportation programs or new program initiatives so that port access and port-related congestion problems can be adequately addressed.

We appreciate the committee's past support and will look forward to working closely with all of you in forging a new federal transportation program. I would be happy to answer any questions that you might have.

Mr. MINETA. Very well, Chairman Anderson.

Mr. ANDERSON. Yes, Mr. Prescott, in your testimony you speak of the association pursuing a comprehensive program of transportation demand management strategies. Could you elaborate on a few of these strategies and how your association plans to pursue them?

Mr. PRESCOTT. Okay, they range from encouraging employers and in and about the airport to van pool, car pool, to meet their AQMD requirements for one point five AVR. It ranges from organizing guaranteed ride home programs to car pools and van pools. At our own company we have both company funded and also employee leased van pool programs with which we attempt to encourage people to van pool. We also are encouraging car pooling and providing a means of access to car pooling for people in and around the airport.

Mr. ANDERSON. You mentioned the telecommuting is a major alternative that you are pursuing. Do you have any other alternatives in mind and if so could you elaborate any of them?

Mr. PRESCOTT. Sure, one of these, alternate work hours, is certainly an interesting area to pursue. At Douglas Aircraft Company back in the late '60's, we had a situation where getting out of our parking lots was a thrill let alone getting onto streets.

One of the things that we began to do is to move shifts about a half-hour or forty-five minutes apart which permitted people to get out of the parking lot easier. It also kind of time-phased the flow onto the freeway systems and surface streets. And it assisted in mitigating some traffic congestion there.

In addition to that, I am experimenting now in certain of my organizations with alternate work hours. I have some people that work, for example a shift that is 1:12 to 9:00 o'clock. It does two things, one they are totally out of the peak period rush hours. Two, when you look at the computer—the reliance that we have on computing in this era, it provides better access to computing facilities for more of their shift. So, there are a number of alternatives there that we are looking at.

Mr. ANDERSON. I would like to see a federal program established to fund intermodal access and if so, what would you recommend such a program to consist of?

Mr. PRESCOTT. I think our Association has discussed a number of funding considerations—the capital projects that we are currently talking about in Long Beach. The members of the Association are participating with others in a benefit assessment district, which we are contributing to. In a nation program, I think we need to recognize that the solution to transportation needs and particularly intermodal transportation needs are not just one solution. It is an aggregate of all the solutions. I think a national program ought to deal with the transportation demand management, transportation system management, optimizing the existing system we have and ensuring that we have a balanced approach across the nation and an approach that is interrelated between the various modes of transportation.

Mr. MINETA. Do I assume that ESEA is looking at transportation issues from the employees prospective of how do I get from my place of residence to work whereas your association is really looking more from the companies perspective, how to improve the

intermodal access in terms of how do I get my goods from my plant to the port—or to the seaport or to the airport?

Mr. PRESCOTT. I do not think that is a correct description.

Mr. MINETA. Do you have programs for all residences around the airport.

Mr. PRESCOTT. I think that is skewing it a little bit, now we are not. Our main focus is in providing support to employers and employees.

Mr. MINETA [continuing]. To employees as well?

Mr. PRESCOTT. Yes.

Mr. MINETA. On page 3 of your testimony you say your members have committed over $7 million to help finance improvements in the vicinity of the airport. What kinds of improvements have those been?

Mr. PRESCOTT. That is correct. There are 19 intersections around the airport that are impacted by two things—the development around the airport and also the increased business at Douglas Aircraft Company. These intersection improvements range from line striping to grade separations that the city has identified and that Mayor Kells' Transportation Task Force has identified. These funds, the seven million that have been committed, are part of the benefit assessment district that we discussed in our presentation.

Mr. MINETA. Now is Douglas Aircraft Corporation, Aircraft Company located at Long Beach Airport?

Mr. PRESCOTT. Yes, it is.

Mr. MINETA. In terms of your employees than, do you have any idea as to what the average commuter pass might cost?

Mr. PRESCOTT. Commuter pass?

Mr. MINETA. Commuter for the local transit agency.

Mr. PRESCOTT. I do not really know the number precisely. I remember $30 or $40 a month a number of years ago—but I do not know if that is true or not today.

Mr. MINETA. The reason I was asking because then the present law that says $15 a month really is inadequate in terms of dealing with that commuter pass provision in the law right now.

Mr. PRESCOTT. Most definitely. In addition to that, looking at the transit systems in the interrelationships of things, the average employee lives in about a twelve mile to a thirteen mile radius of our plant and much of that outside the LA County. A certain portion of that is in Orange County and other counties where the interconnection of transit alternatives does become an issue.

Mr. MINETA. Other than those 19 intersections surrounding the airport, what kinds of other projects are you pursuing to reduce congestion at the airport?

Mr. PRESCOTT. Our guaranteed ride home programs that we were talking about. To encourage employers and employees to get into car pools, van pools. We have not pursued it actively at this point but we are looking at also encouraging alternate work hours similar to what we have at Douglas Aircraft Company.

Mr. MINETA. I take it there are increasing number of commercial flights at the airport?

Mr. PRESCOTT. The flights have increased but they have been limited. There are other people who could probably give you better data on that than I could.

Mr. MINETA. You have a curfew at the present——

Mr. PRESCOTT. Yes, 10:00 o'clock.

Mr. MINETA. Ten o'clock and then what time in the morning?

Mr. PRESCOTT. I believe it's 6:00 but I am not sure about that.

Mr. MINETA. Well, Mr. Prescott, thank you very, very, much for your presence here and your testimony. I appreciate it very, very much. I would like to call on Mr. William Woollett, Jr., Executive Director Transportation Corridor Agencies, Costa Mesa.

TESTIMONY OF WILLIAM WOOLLETT, JR., EXECUTIVE DIRECTOR TRANSPORTATION CORRIDOR AGENCIES, COSTA MESA, CA

Mr. WOOLLETT. Thank you very much, Mr. Chairman. Also to you, Mr. Anderson, and particularly Mr. Hastert. Your patience in listening to Californians trying to solve our problems all day, I sincerely hope there is some reciprocity in terms of their attendance at any hearings that will be held in your area.

Let me briefly report to you on some toll projects in Orange County which we are very proud of. Three transportation corridors in Orange County, the first toll roads in California since the turn of the century are an important step forward not only for the state, but for the nation. Design and construction is administered by a Joint Powers Authority and financed through locally generated funding.

They are unique public, private partnerships. In advance, the private sector has agreed to pay 48.5 percent of the cost of construction with the public sector paying the remaining of 51.5 percent. Ground breaking will begin on the nearly 70 miles of new highways late this year. All three will be under construction by next year. It will begin opening in late 1993, we hope to open the last one in 1996. Our ability to meet these deadlines depends on our ability to comply with a variety of federal environmental regulatory requirements.

I would like to focus my discussion today on our efforts to comply with the Clean Air Act and with Section 4(f) of the Department of Transportation Act. The Clean Air Act requires new transportation facilities to be in conformity with state plans adopted pursuant to the federal Clean Air Act. The new South Coast Air Quality management district has adopted a dramatically new plan for the Los Angeles Basin, including new provisions for transportation facilities. The essence is projects included in the regional mobility plan are not required to undergo separate determination for compliance. In our view, it makes no sense to require additional review of a project's conformity once that project is specifically included in the air quality plan. We sincerely appreciate the successful efforts of Chairman Anderson and other Members of this committee to amend the federal legislation to make it clear that project by project conformity is not required by the Clean Air Act.

Section 4-f prohibits the federal highway administration from approving use of parks and open space by highways unless there are no feasible or prudent alternatives. Recently, federal courts have narrowly interpreted this section in a fashion that may jeopardize the construction of the corridors. These courts have held that highways are subject to the 4-f requirements even where the park area

and highways have been jointly planned to minimize the impacts of the highway.

Many of the park and open space areas in Orange County were established with the explicit understanding that the corridors would be located in the vicinity of the parks. Indeed in many cases, the parks and the corridors were planned together to minimize the impact. We are proud of this planning process which has established large new park areas and environmentally sensitive alignments for the corridors.

Ironically, these court decisions are discouraging the establishment of new parks because of the legitimate fear that they will jeopardize the construction of new transportation facilities. We encourage this committee to investigate this serious problem and consider an appropriate legislative solution. Our agency in combination with the county of Orange and also with the environmental groups expect to make such a recommendation to the Congress by the end of this year.

Our transportation corridors have been made possible through an innovative combination of public sector support and private sector cooperation. Just as President Bush recommended in his transportation plan, we are a locally funded answer to a local need. The fact that the Federal Government cannot fund all improvements must be understood and incorporated into policy making at all levels of government. Because of the success to date in ensuring that these toll ways become a reality, the program designating the corridors is a pilot project through the 1987 legislation supported by Chairman Anderson and his committee is worthy of emulation.

The Orange County transportation corridor stand as an example of successful cooperation with all levels of government in accomplishing a goal befitting its citizens. Thank you Mr. Chairman. I will try to answer any questions.

Mr. MINETA. Thank you, Mr. Woollett. Chairman Anderson.

Mr. ANDERSON. Thank you, Mr. Chairman and Bill. Bill, as you know, I continue to be a strong advocate of the beltway concept for the San Joaquin Eastern Foothill Corridors.

In fact it was my legislation in 1987 which designated for the purpose of a federal highway program the three proposed corridors as a single demonstration project. I originally supported the beltway concept because the three corridors do serve a common transportation purpose to route traffic around the developed and increasingly congested I-5, I-405 corridors.

However, I have become increasingly concerned with the local implementation of this concept. Most specifically since the three corridors are not considered under federal law as one project, why must we have two local planning agencies, the San Joaquin Transportation Corridor Agency, and the Foothill Eastern Corridor Agency to implement one project. Quite frankly, it would seem that one local agency could more effectively and efficiently do the job of implementing the Orange County beltway concept.

I would venture to guess that if one local agency was formed to plan all three corridors, your success at Washington at the Federal Highway Administration might be greatly enhanced and as such, I strongly urge you to further examine this matter and would you agree with me at all on this Bill?

Mr. WOOLLETT. Mr. Anderson, as an executive director, my life would be a lot easier if I had only one board of directors instead of two. As I am sure you are well aware, the primary reason we have two agencies is that in the beginning we started out with two areas of benefit. And the concept was that the property owners in those areas would contribute money toward the construction of these corridors and even though the two areas of benefit overlap, under California law we find ourselves constrained currently, at least in terms of providing the benefit to those specifically designated areas. I think there are a lot of us, not only myself but people on my board who can see very much sense to the suggestion that you are making and as you know there are also movements in Orange Country right now to consolidate transportation agencies. I think those may be successful in the near future.

We are certainly willing to take a good look at the problem as I say, I am a little biased. I happen to think it is a great idea.

Mr. ANDERSON. Besides from the bias, take a good look at it again.

Mr. WOOLLETT. Will do that.

Mr. ANDERSON. Thank you. Thank you, Mr. Chairman.

Mr. MINETA. Mr. Woollett, you pointed out in your testimony the problems of dealing with Clean Air Act as well as Section 4-f. Are there other federal requirements that impose significant limitations on your ability to advance the toll pilot projects?

Mr. WOOLLETT. No, sir.

Mr. MINETA. Now your estimated cost of the toll pilot project is somewhat a little over $2 billion, I am wondering if you are able to quantify the additional cost that is incurred as a result of having to adhere to the federal requirements?

Mr. WOOLLETT. I do not have an answer to that question, but I will get it for you.

Mr. MINETA. And the Orange County transportation corridor was authorized as a toll project in the '87 legislation as you pointed out authored by our very fine Chairman, Mr. Anderson. Does the 35 percent federal match provide enough leverage to encourage the development of public/private partnerships to develop toll projects?

Mr. WOOLLETT. In our case, yes.

Mr. MINETA. And are you aware of any other projects in the state of California that are being considered for toll projects?

Mr. WOOLLETT. Only those projects that are currently being considered under the new 680. Those are private toll way projects and I think there will be four or five of those initially.

Mr. MINETA. Any other areas in the state here that are following your lead?

Mr. WOOLLETT. Not that I know of.

Mr. MINETA. You have not received any inquiries from other counties thinking about doing something like this?

Mr. WOOLLETT. No we have not although it is my feeling that we are very much on the cutting edge of this. Someone who was born and raised in Los Angeles and has lived long enough to remember World War II etc, and all the congestion we have had since then, it is my personal feeling any time you can get the private sector to make a commitment in advance to the extent that has occurred in Orange County, you are making substantial progress.

Mr. MINETA. You have right of eminent domain?

Mr. WOOLLETT. Yes.

Mr. MINETA. That is one of the biggest things that is lacking in the Virginia Toll Road Authority because they did not get grant it. And I think that is really what stymied Ralph Stemly and his efforts there.

Congressman Hastert.

Mr. HASTERT. No questions.

Mr. MINETA. Well, Mr. Woollett, thank you very, very much for your preserving efforts there in these projects because frankly, you know, you are being looked at nationally and we are very, very interested in what you are doing there. Thank you very, very much.

Mr. WOOLLETT. Thank you, Mr. Chairman.

Mr. MINETA. At this time I would like to call on Carol Margolis, the Assistant Program Manager at the Betty Clooney Center. Ms. Margolis is being accompanied by Richard Suenishi.

TESTIMONY OF CAROL MARGOLIS, ASSISTANT PROGRAM MANAGER BETTY CLOONEY CENTER, LONG BEACH, CA, ACCOMPANIED BY RICHARD SUENISHI, PATIENT, BETTY CLOONEY CENTER, LONG BEACH, CA

Ms. MARGOLIS. Mr. Chairman and committee Members, my name is Carol Margolis. I am the Assistant Program Manager of the Betty Clooney Center. It is a treatment and rehabilitation facility for brain injured persons in Long Beach. We appreciate the opportunity to testify before you.

I am here to introduce Richard Suenishi, who attends the Clooney Center. Unfortunately, Richard is only one of many members or clients who are at our center because they were in motorcycle crashes and were not wearing helmets.

Richard wanted to speak to you today because it is our nation's highway safety' laws which have the greatest influence on how many young men and women will suffer sever life-long disability and will thus join Richard at facilities such as the Clooney Center because they did not wear motorcycle helmets.

A recently released study by the San Francisco Injury Center indicates that helmet use is the single most important factor in preventing death and head injury in motorcycle crashes. The report concludes that the most effective method to prevent head injuries is to mandate helmet use by all motorcyclists.

If every California motorcyclist wore a helmet, as many as one hundred and sixty lives would be saved annually. One thousand serious injuries would be prevented and California could save an estimated $74 million in medical costs, property loss, and loss productivity.

In Richard's case alone, the medical and long-term care which he needs has cost his insurance company and U.S. taxpayers more than $1 million so far.

We at the Clooney Center hope not just for an all rider helmet law for California but for all states. Federal leadership is necessary if this hope is to achieved. Mr. Chairman, as you and your committee write the new highway safety programs, Richard and I urge you to include strong provisions and support of helmet laws so that

motorcyclists and their families around the country are spared the tragedy which Richard and so many others have endured.

Thank you very much. Richard.

Mr. SUENISHI. My name is Richard Suenishi and six years ago when I was 18 years old I was in a motorcycle crash. And I was not wearing a helmet. I was in a coma for six weeks. In high school I was a gymnast and now I must wear a leg brace. And I cannot use my right hand. I move very slowly and I talk funny. I cannot run or drive. I live with my parents. If I had worn my helmet that day, I would be on my own with a job, maybe a wife and kids by now. Instead I am dependent on the state for money and my family and the Betty Clooney Center for support and training.

Some day I hope to be able to hold a job but for now I am trying to regain some of the skills I had before the crash. I no longer have things to take for granted, like walking, talking, having friends, being independent with money in your pockets.

Please stop others from my fate. Pass the laws needed to save lives. Pass motorcycle helmet laws now. A brain is a terrible thing to waste.

Mr. MINETA. Thank you very much, Richard. Thank you very much, Carol. Chairman Anderson.

Mr. ANDERSON. Yes. Now California currently has a motorcycle helmet law for riders under the age of 18. Is this law enforced adequately? And what percentage of motorcycle riders in the state are under the age of 18? What percentage of motorcycle head injuries in the state are incurred by riders under 18? In general, are not under 18 motorcycle riders the most difficult to convince of the value of wearing motorcycle helmets or is this true for older riders as well?

Ms. MARGOLIS. Well most motorcycle fatalities occur, 90 percent of which occur over the age of 21 and I would say a great percentage of those were not wearing helmets. I think that it is extremely difficult to enforce a law because you cannot tell the age of a person that is riding by. I think that all states that have all rider helmet laws have proven to be 95 to 98 percent in compliance. I just think that a partial law is really not very effective at all and I do not see how it could be enforced effectively.

Mr. MINETA. Here in California did we not have a helmet law and then it was taken off the books, is that the case? It was just vetoed by the Governor, is that it?

Ms. MARGOLIS. Yes.

Mr. MINETA. I see okay. I think we do have some example of some states where there was a helmet law and then it was reversed, was it not? Do we not have some examples of states where they did have a helmet law and then in a subsequent legislative session they were—up to state legislative action—under the Cooper Bill this would reinstate a mandatory helmet provisions for—Ms. Margolis, what is your prediction for the likelihood that California would pass a mandatory motorcycle helmet law for all riders in the near future?

Ms. MARGOLIS. I know that there is strong opposition to this law by various groups that are of some importance. I think that—I really strongly believe that federal guidance is needed to support

the law throughout the land. I do not think California is enough to—support it.

Mr. MINETA. Do not both Ms. Feinstein and Senator Wilson have expressed their support of a motorcycle helmet law as I recall so at least some of us think that the prospects of at least something happening here in California are very good regardless of who is elected governor.

Congressman Hastert.

Mr. HASTERT. Thank you, Mr. Chairman. I just might want to make a comment here. I come from the state of Illinois and spent 10 years in the Illinois legislature and almost every session we had a helmet law before us but there was such a huge amount of protest of people against that helmet law and I would suggest that education is a very important aspect to this and educate mothers on what can happen and here we have mothers against drunk driving and those types of groups, and they have been very effective. And I would suggest that possibly an educational group of that type would be very instrumental in helping pass a state law let alone a national law.

Ms. MARGOLIS. Sir, we have people from our center that have suffered severe injury go out to high schools, especially, and try to educate the public. I think that Richard and people like him that have gone through it are the best teachers.

Mr. HASTERT. Thank you. And thank you, Mr. Chairman.

Mr. MINETA. Ms. Margolis and Richard, thank you very, very much for being here and as Congressman Hastert has indicated and Carol has indicated, your going around and speaking as you do is probably doing a lot so thank you very much for all your efforts.

Mr. SUENISHI. Yes, but do you know that when this is just the second time that I have been speaking out.

Mr. MINETA. Maybe this will encourage you to do some more. Thank you very much. I would like to submit for the record the statement from Sierra Club, the Los Angeles Chapter as well as from the Automobile Club of Southern California and ask unanimous consent to keep the record open in order to have other statements be made a part of the record.

If there is no other business before the subcommittee, we stand in adjournment.

[Whereupon, at 6:30 p.m., the subcommittee adjourned.]

[Statements of the Sierra Club and the Automobile Association of America follow:]

SIERRA CLUB — ANGELES CHAPTER

July 28, 1990

Glenn M. Anderson, Member of Congress
2329 Rayburn House Office Building
Washington, DC 20515

Dear Congressman Anderson:

We have learned, belatedly, of your hearings on the reauthorization of Federal-aid highway, mass transit and highway safety programs. This letter presents our views on this question.

Americans own and operate over one-third (36% in 1985) of the world's cars and trucks; they consume half the world's motor fuel, they generate one billion tons of CO_2 each year.

They are the world's largest consumer of fossil fuels and the largest generator of global warming gases. The burning of the Amazon forests, as deplorable as that is, is almost trivial by comparison.

In addition to the production of global warming gases, the American automobile/truck/highway sector is the origin of critical environmental abuse--air pollution, traffic congestion, traffic deaths and injuries, acid rain, ozone depletion, the Exxon Valdez syndrome, depletion of the world's oil reserves.

This unhappy dependence on the automobile and the truck, the so-called American 'love affair with the automobile' is the result of unwise government (local, state and federal) policies. These have permitted gross subsidization of these vehicles.

American motorists and the trucking industry are the beneficiaries of incredibly large subsidies; these are so large (the equivalent of $3.50 per gallon at present rates of consumption) as to create important obstacles to American generation of capital.

In other words, the American automotive/highway sector is not only destroying the planet's environment, it is also bankrupting the nation's economy because it absorbs 25% of its GNP.

This situation is now becoming more apparent to your constituency, the American taxpayer. Also, because of the federal budget crunch, it appears likely that a substantive increase in the federal fuel tax can now be contemplated.

We believe that a large increase in the federal fuel tax would be in the public interest. It may be that this public interest consideration may be sufficient to encourage the Congress and the Administration to act.

Ideally, such an increase should be accompanied by a decrease in the property and the sales tax burden because that is how, in part, Americans pay for these subsidies. However, we recognize that structural difficulties may not permit this.

There is a grave danger, however. The trucking industry will certainly press Congress for the right to use larger and heavier truck/trailer combinations. Historically, they have been most fervent and most successful in conjunction with (and at the time of) a fuel tax increase.

There are several reasons why larger and/or heavier trucks would be disastrous for the American highway system, the American motorist and, more importantly, for the American economy and the American environment. Of the automotive sector, the American eighteen-wheeler truck is the most heavily subsidized. While the motorist is heavily subsidized by the community through various channels, he, in turn, subsidizes the trucking industry.

Despite the propaganda of the Truckers Association, existing fuel tax and mileage-weight fees are far from sufficient to pay for the increased costs in highway construction, the destruction of pavements (see below), and for the space which they preempt on the nation's highways.

Large trucks already dominate the American highway; they are a principal cause of urban traffic congestion and safety problems. Their daily catastrophic accidents tie up traffic on urban freeways for hours. They fill, entirely, the two outside lanes on many freeways to the complete confusion and hazard to motorists in their vulnerable vehicles.

This problem is exacerbated by the recklessness which has become characteristic of drivers since the lifting of truck regulation, thus significantly increasing the hazards imposed by these ponderous, unmanageable vehicles.

Present pavements have not performed well; the failure of these pavements is a large part of the difficulty we have experienced with our infrastructure. The criteria for the design of pavements is based on the data collected by the AASHTO Road Test of 1960-1962. Professor Ken Small (U.ofC.Irvine) has recently (1985) reanalysed the AASHTO data, using modern statistical techniques not available in 1962. He has shown that the heavy axle loads are far more destructive than had been thought.

The 1962 analysis derived the theory that this destructive capacity was proportional to the fourth power of the axle weight.

Small's work has shown that the sixth power of the weight is more accurate. Thus, existing pavements, designed and built in accordance with the original analysis are not, by Small's reanalysis, capable of resisting existing truck axle loads. Experience, unfortunately, has demonstrated the validity of the Small reanalysis. To add more axles or heavier axles would compound the present disastrous overuse of these pavements.

I have made a study of the construction cost of an urban freeway in the Los Angeles area. I have shown that urban freeways owe as much as 40% of their construction cost to the requirement to accommodate these heavy trucks. Neither of these effects have been considered in calculating the present fuel tax or mileage/weight fees for trucks.

Thus, any increase in truck size, truck weight or in the numbers of trucks (which would follow from either or both of these) would add gross insult to already gross injury.

Sincerely,

Stanley Hart, Chairman
Transportation Committee

Automobile Club of Southern California

Statement: The Post-Interstate National Transportation Program

Introduction

Our nation's transportation system must provide for the safe and efficient movement of people and goods. As we approach the development of the post-interstate surface transportation program, there is one fundamental reality that must remain in the forefront: The highway system is the major building block of the nation's transportation system. Without adequate highways, other key travel modes--transit, trucking, aviation, railroads, waterborne--will not be able to fulfill their roles.

It is important that the national surface transportation program reflect a goal for the next era of highway system investment. We support the following two-part goal:

- The highway system must continue to support economic growth by providing the work force with congestion-free access to industry and commerce as well as providing efficient goods movement.

- The highway system must provide convenient and easy access to medical care, child care, shopping, recreation, education and cultural opportunities.

The scope of the program to accomplish these goals must be broad. The capacity of the highway system must be significantly increased. Existing highways and freeways must be modernized and new ones built. It is from this perspective that the following specific comments have been developed.

Highway Factors. The post-interstate national surface transportation program must ensure that a realistic and attainable mix of solutions are implemented for problems of safety, congestion, access and mobility. As we strive to ensure that all modes, all systems, all regions, and all segments of the market are included in policy, we may overlook the tremendous investment of our financial, economic and social wealth that we have already made in the highway system. Humanity has striven for increased mobility since the beginning of history. The vehicle-highway system has provided the best means to date to meet that need and has vast potential for further improvement. We are convinced that solutions to the environmental, community, and energy problems of the vehicle-highway system are within our grasp. Mobility need not be constrained to achieve other community and environmental goals:

1) We believe the provision of adequate freeway/highway system capacity is essential, supported by mass transit, transportation system management, and transportation demand management programs. The private automobile will continue to dominate our mobility system in spite of views expressed to the contrary which are well-meaning but short-sighted. Our highways provide the best available means of mobility, and can adapt to meet changing requirements.

2) It is our view that high national, state and local priority should to be given to freeway/highway system management, particularly in urban areas. Effective traffic surveillance, ramp metering, driver information, and incident clearance can reduce congestion to nominal levels on the existing freeway system and on new links as they are added, demonstrating that freeway capacity need not be filled to congested levels on opening day or during the life of the facility. Freeway system management is the natural precursor to the intelligent vehicle/highway system.

3) To meet highway maintenance, construction, and management needs, stable and adequate funding is an obvious well-documented need. Sufficient funds should be collected on the national, state and local level from users and others who benefit in proportion to benefits received. Sequestration of funds must be ended--spend down the trust funds and keep faith with the taxpayer.

Institutional Factors. The post-interstate program should encourage the development of institutional arrangements and processes that are appropriate and responsive to the changing transportation environment:

1) While national policy must give priority to issues of national significance, national interest clearly extends into urban areas. System continuity is critical. Urban systems are the vital interface between interstate interests and regional interests. The economic vitality of the nation is the aggregate of the economic vitality of the regions, urban and rural. Hence, national policy should not stop at regional borders or focus only on interstate systems. We believe, for example, that freeway system management and transit system development should be approached from a regional basis in Los Angeles and San Diego--and national policy should encourage and the new surface transportation act should support that approach.

2) More specifically, the linkage between land use decisions and transportation system decisions must be strengthened at all levels. National policy required such a linkage decades ago at the regional level. Achieving the vital balance between travel demand and system capacity will require strong state and national support, and must be achieved at the local level.

3) We believe highways can play a dominant role in revitalizing our urban areas. The construction of new urban freeways could be the vehicle for overcoming inertia to rebuild our cities. New urban freeways can not only provide vital regional access for communities, but can be the principal incentive for economic development. We propose a new partnership for community revitalization, with local communities taking the lead role in joint development authorities, guiding freeway and urban development.

Human Factors. Historically, human factors have been shown to be a major cause of transportation system casualties:

1) The new national transportation program must include elements to minimize alcohol and drug impairment for drivers--both commercial and those operating personal vehicles:

   - We strongly urge continued focus on the problem of driving while impaired by legal or illegal drugs.

   - It is our view that continued vigilance is called for in the area of commercial driving--to assure implementation of the 0.4% blood alcohol content limit and to consider the potential benefits of tightening this standard.

   - The lack of simple and reliable test for drug use is a critical technical deficiency in establishing and tracking changes in the role of drugs in highway crashes and casualties.

2) The post-interstate national transportation program must ensure that user capabilities are not exceeded by demands of the transportation system. Demographic trends such as changes in population age and culture of origin interact with higher volume and more complex traffic patterns:

   - We urge continued attention to the performance and needs of older drivers so they can safely retain their mobility.

- We are currently studying methods to identify problem drivers. An effective national driver information clearinghouse may be needed.

- Business and commute driving provide underused opportunities for improved driving through job site training and oversight programs. We view safe business driving programs as a needed and cost-effective component of road safety policy.

Vehicle Factors. The new national transportation program should encourage immediate and ongoing improvements in the vehicle and the vehicle/driver/highway system:

1) We encourage high priority for development of the intelligent vehicle/highway system:

   - Top priority should be given to improvements in collision avoidance through longitudinal and lateral guidance and control.

   - We urge increased research and development into on-board road information systems. Traffic flow and safety will be significantly improved as accident warnings, weather alerts, and congestion information are made more accurate and rapidly available to the driver.

   - We view development of in-road power systems as a promising alternative vehicle energy supply and as a step towards highway automation in large urban areas.

   - National policy should redirect planning and research funds to the smart car/highway area. The federal government should provide the link between public highway agencies and private vehicle manufacturers.

2) The vehicle itself can become safer and more efficient.

   - We urge continued and accelerated attention to improvements in internal combustion vehicle energy consumption and pollutant emissions. Significant further improvements are possible in both areas.

   - The same on-board diagnostics system managing vehicle energy consumption and pollutant emissions can provide real-time monitoring of vehicle defects over the full range of vehicle systems.

- We urge and support continued development of occupant protection systems.

- In-vehicle driver monitoring systems are needed such as steering reversal analysis, continual "g" loading assessment, and driver inattention alarms to signal driver impairment due to fatigue, illness or drugs.

- Research is needed into new methods to control vehicle noise. Noise pollution is a critical urban problem and a major impediment to highway system development.

Conclusion

Highways are the backbone of our mobility system. They carry carpools, vanpools, nearly all transit, and nearly all goods movement. Use of the highway system is increasing and will continue to increase in response to economic and social needs and desires. Sound development and management of the highway system must be the primary focus of national policy as we move to revitalize our cities and meet mobility needs of all the people.

PREPARED STATEMENTS OF WITNESSES

TESTIMONY

OF

DAVID R. ASHCRAFT
TRANSPORTATION DIRECTOR
CITY OF CULVER CITY
CULVER CITY MUNICIPAL BUS LINES
9815 JEFFERSON BOULEVARD
CULVER CITY, CALIFORNIA 90230

BEFORE

THE SUBCOMMITTEE ON SURFACE TRANSPORTATION

OF

U.S. HOUSE OF REPRESENTATIVES
COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION

REAUTHORIZATION OF THE POST-INTERSTATE
SURFACE TRANSPORTATION PROGRAMS

MONDAY, JULY 2, 1990

LONG BEACH, CALIFORNIA

Mr. Chairman and distinguished members of The Subcommittee on Surface Transportation, my name is David Ashcraft and I am the Transportation Director of the Culver City Municipal Bus Lines in Culver City, California. It is a privilege for me to appear before you on the subject of "Reauthorization of the Post-Interstate Surface Transportation Programs".

I am here to speak to you as the manager of a small transit system operating within a large urbanized area. Culver City Municipal Bus Lines, known as Culver CityBus, is one of thirteen municipal transit systems within Los Angeles County providing efficient and effective bus service that complements the regional transit operator.

The City of Culver City began operating its own municipal bus system on March 4, 1928. Next to San Francisco Muni, it is the oldest continuously operating municipal bus system in the State of California. Our City Council considers Culver CityBus a vital service to the residents and businesses in and around Culver City.

Today, Culver CityBus operates with a total fleet of twenty-eight (28) buses over six routes. The service area includes Culver City and the communities of Westchester, Marina del Rey, Palms, Rancho Park, Venice, Mar Vista, Westwood and West Los Angeles. Service runs from Los Angeles International Airport on the south to the University of California at Los Angeles on the north, and

from Fairfax Avenue and Washington Blvd. on the east, to Venice Beach on the west. Culver CityBus' service area encompasses 25.45 square miles of which the population is estimated to be 191,000.

Ridership continues to grow on Culver CityBus routes. During Fiscal Year 1990, over 3.8 million passengers, an all time record, rode on our buses. This is a 10 percent increase over last year and 35 percent above five years ago. Our buses traveled approximately 900,000 miles in FY-90 and we provided 81,000 hours of service. This calculates to 47 passengers for every hour of service that we were in operation in FY-90.

The ridership increase experienced by Culver CityBus is not unique. There are twelve other municipal transit systems within Los Angeles County who are also experiencing increased ridership. These increases can be partially attributed to area development, traffic congestion, and air quality concerns. However, a major contributor to ridership increases is the Southern California Air Quality Management District's Regulation XV. This regulation requires all employers in the Los Angeles Basin with more than 100 employees to develop and implement a trip reduction plan. The goal of Regulation XV is to meet the Federal requirements of the Clean Air Act.

Increased ridership is the goal of every transit system in the United States. However, with success comes additional financial burdens. Culver CityBus is reaching a point where ridership will soon exceed capacity, especially at peak times. To meet the need, additional capital and operating assistance will be necessary. Although, the State of California and Los Angeles County contribute substantial funds for transit services, there is still the necessity for increased transit funding from the Federal government.

In addition to these increased ridership demands, the regulatory requirements contained in the recent passage of the 1990 Clean Air Act and the Americans for Disabilities Act, will have an increased financial impact on all transit systems which will be considerable. Again, without Federal financial operating and capital assistance, transit systems will be unable to meet mobility needs of the public and Federal mandates.

I urge you and your colleagues in the Congress, as well as the Administration, to pass into law and again reauthorize the Surface Transportation Act and its various programs at levels which will enable our transit systems to meet the ever increasing demand for public transit in the years to come.

Thank you for this opportunity to express my concerns and views.

Testimony

of

MAYOR TOM BRADLEY

before the

SUBCOMMITTEE ON SURFACE TRANSPORTATION
HOUSE COMMITTEE
ON
PUBLIC WORKS AND TRANSPORTATION

July 2, 1990

Long Beach City Council Chambers

on

REAUTHORIZATION OF THE POST-INTERSTATE
SURFACE TRANSPORTATION PROGRAMS

REAUTHORIZATION OF THE POST-INTERSTATE SURFACE TRANSPORTATION PROGRAMS

Mr. Chairman, Chairman Anderson and other distinguished Members of Congress, I welcome the opportunity to testify before you today and to share with you some of the concerns of Los Angeles as you begin the process of formulating legislation to reauthorize the Surface Transportation Act of 1982.

I am particularly pleased to be here this morning with two distinguished Chairmen, both friends who give California an important and effective voice in Congress on an issue of such profound meaning to all Californians.

Chairman Anderson has been a force on the House Public Works Committee for more than two decades, and your legislative stewardship Mr. Chairman, has enabled us to improve our essential regional infrastructure: including the ports of Los Angeles and Long Beach, the regional airports and our highways and transportation systems as well as many of our water projects.

No place has your leadership been more appreciated than in helping us to secure federal support for the Los Angeles Metro Rail that, as the backbone of a county-wide system of light, heavy, and commuter rail, will effectively serve the people of Los Angeles in the decades to come.

Chairman Mineta, whom I first became acquainted with when we were both City Councilmembers, is one of the most respected members of Congress, and is widely heralded for his leadership of the House Aviation Subcommittee before taking over the helm of the Surface Transportation Subcommittee from Chairman Anderson. Mr. Chairman, you are well suited to take on the enormous task of formulating the Post-Interstate Surface Transportation Programs that will establish the criteria for new transportation projects well beyond the 1990's.

The Need for Transit

Although this Committee will conduct field hearings throughout the Nation, nowhere will you find a greater need for alernatives to single passenger automobiles than in Southern California. Challenges of air quality, congestion and continuing population growth require ambitious solutions.

The people of California spoke up for just such solutions last month by voting for an increase in our state gasoline tax and rail bonds dedicated to transit and highway improvements.

While these measures will provide critically needed financial support, they do not diminish the need for a strong federal role in transportation which has, unfortunately, been eroded over the past ten years. In fact, federal spending for transit has declined from $4.6 billion in FY 81 to just over $3 billion in FY 90.

The impact of this declining federal investment has been devastating to Los Angeles at a time when we should be increasing the number of shared rides as well as the market share for transit.

The Los Angeles Metro Rail

A continued federal commitment to Metro Rail is critical to the expansion of transit capacity which is needed to relieve congestion on our streets and highways.

It remains absolutely imperative that the Post-Interstate Surface Transportation Programs explicitly authorize funds for the completion of the Metro Red Line to the San Fernando Valley as well as for the beginning of the Orange Line extension to East Los Angeles and Westside.

Because of your existing legislative guideline for transit projects, the Metro Red Line stands out as the most promising new-start rail project nationwide, and as a model of strong local and private sector participation.

We are now more than 60% complete with the construction of the first 4.4 mile segment which extends from Union Station to MacArthur park. The full funding agreement was signed in a ceremony with the U.S. Department of Transportation on April 10, 1990 thereby providing the financial basis for construction of the next 6.7 miles referred to as MOS-2.

This extension proceeds northwest to a station at Wilshire/Vermont where the alignment branches north and west. The northern branch proceeds to an interim terminus at Hollywood and Vine while the western leg goes to an interim terminus at Wilshire and Western.

Provisions in H.R. 2 which allowed for the full-funding contract for MOS-2 were essential to our efforts to secure the $667 million federal share. Likewise, we estimate that the federal share of MOS-3, the 6.3 mile third segment from Hollywood and Vine to North Hollywood terminating at Lankershim and Chandler, to be $668 million, and we look to your leadership to include a specific authorization and contract authority for this funding in the reauthorization bill.

The light rail lines are entirely locally funded, including the Blue Line from Long Beach to Los Angeles which opens in less than two weeks. Therefore, overall, 75% of rail construction for light and heavy rail is being funded locally through Propostion A and other sources. In contrast with Section 3 policies, which require only a 25% local match, Los Angeles is providing 48% of the Metro Red Line funding locally.

The LACTC is pursuing a number of innovative strategies to control costs and accelerate design and construction of the Metro Red Line. We expect that MOS-1 will be open for service even before 1994 with the western extension of MOS-s open by 1996 and service to Hollywood and Vine by 1998. The full alignment to the Valley will be in operation by 2001, providing links with the Light Rail Lines including the Blue Line, the Green Line along the Glenn Anderson Freeway, as well as the Pasadena, Valley, and North Coast Lines providing more than 80 miles of rail transit.

This month, the LACTC submitted the documents for planning the route for the Orange Line, which will serve an identified corridor east of Union Station and west of the Wilshire/Western alignment.

A system planning study prepared by the Southern California Association of Governments (SCAG) found nearly 100,000 commuters traveling within the area between Santa Monica and Norwalk.

During the next two years, we will be studying potential routes for the Orange Line and conducting community hearings and other efforts to elicit public participation in selecting the final alignment.

We expect that the Orange Line will extend up to eight miles in both an east and west direction. This would enable us to connect Whittier and Arizona Boulevards in East Los Angeles to Century City and Westwood in West Los Angeles.

Although construction on the Orange Line will not begin until 1996, it is our hope that this reauthorization bill will earmark $50 million for preliminary engineering and final design of this new phase of Metro Rail.

We are very enthusiastic about the prospects for the Orange Line, and appreciate the support of this Committee in ensuring that progress continues for its planning and design.

Federal Aid Urban Program

The Los Angeles portion of the interstate system used to carry more than 60% of commuter trips, as congestion on the freeways increased, traffic has shifted so that now more than 60% of these trips are carried on our city arterial streets.

It is my understanding that with the completion of the interstate construction program, more funds will be available to repair and reconstruct exisitng interstate highways. I support this shift in priorities, but I would like to take this opportunity to point out the importance of increasing the Federal Aid Urban Program (FAU) which allows a pass-through of federal highway funds directly to counties and cities for the purpose of funding local highway projects.

Los Angeles, and I am certain other cities in the region, need an increased FAU program to fund projects which will meet this increasing demand on our local streets from traffic which used to be carried by the interstates. We must act as we have to keep this added traffic moving smoothly on our arterial streets in order to protect local residential streets from intrusion. The City of Los Angeles has made good use of its $10 million in annual entitlements for such projects as street widening and roadway reconstruction and signal synchronization.

In addition, ATSAC, Los Angeles' internationally recognized smart streets program, has and must continue to rely heavily on FAU funds matched with local funds for its development and expansion. It gives us automated traffic signal synchronization based on measurement and communication of intersection traffic flow. This also provides our control center information about areas where accidents or incidents have tied up traffic so we can exercise hands-on control and immediately alleviate the problem with changes in signal timing and dispatch of personnel and equipment. We need this program implewmented citywide as soon as possiblw. An increased FAU program will provide a crucial boost to allowing us to have this in place in less than ten years.

The effectiveness of this system has led to another local project I would like to bring to your attention.

Smart Corridor

The technology developed in the City's ATSAC Smart Streets Program has become a major component of the Smart Corridor Demonstration Project. This $50 million project is a cooperative inter-agency effort of the City Transportation and Police Departments, CALTRANS, California Highway Patrol, and LACTC. The Smart Corridor Project is one of the leading-edge Intelligent Vehicle/Highway System (IVHS) projects in the country. Its success is recognized as crucial to the evolving national IVHS programs. I would therefore ask that you consider a specific allocation of $10 million from the IVHS program to the City for the implementation of the Smart Corridor Project.

The Smart Corridor Project will utilize the most advanced electronic and communications technologies available to improve the management of traffic and better utilize available highway infrastructure. Traffic signal timing will be adapted to changing traffic conditions, emergency response teams will be dispatched to clear major incidents, service patrols will aid disabled vehicles, and motorists will be provided with accurate and complete information on traffic conditions so that they can make more informed route choices. Another important benefit will be improved management of spillover traffic from congested interstate highways and arterial streets to local residential streets.

It is estimated that implementation of the Smart Corridor will reduce travel times by 15%, fuel consumption by 13%, and air emissions by 10%. Contingent on favorable results from the demonstration project, we plan to expand the utilization of this advanced traffic management to other corridors such as the Harbor Freeway and Ventura Freeway in the City and County during the 1990's. The technology developed will also be transferable to other metropolitan areas in the United States.

Although the funding for this demonstration is largely local, there remains the need for federal involvement and support with flexibility to the City of Los Angeles as well as the other funding partners. This is particularly true in regard to the use of the Smart Corridor as a test bed for evaluating the use of various advanced technologies to improve traffic management, and thereby increase the efficiency of our overcrowded interstate highway system while protecting our local residential streets. If this test bed proves successful, we would hope for significant allocations to the City from an expanded IVHS program. Federal support through the expansion of the IVHS program will make possible the accelerated deployment of Smart Corridor technology elsewhere in the City and County.

Consolidated Transportation Corridor (CTC)

Mr. Chairman, I know that one of the principles guiding this reauthorization is its ability to help America compete in a global marketplace. We should not forget for a minute the role of an effective and efficient surface transportation system in the growth of the commerce and industry of our region. Clearly, we in California cannot expect to maintin our preeminent economic standing in the world if we do not construct and maintain a comprehensive network of highways, rails and mass transit lines. In my travels abroad, it is made clear to me time and again that cargo is not moving efficiently through the Ports of Long Beach and Los Angeles into the heartland of the nation and indeed even on to European destinations through the "land bridge". For that reason, I would urge the Chairman to consider giving added priority to intermodal projects that address this deficiency. You will be taking testimony from Councilman Jeffery Kellogg, of Long Beach, about our local initiative to form a Joint Powers Agreement to carry out a rail and highway consolidation project along Alameda Street running between the ports and the downtown rail-yard area of the City. This project will allow a more rapid movement of cargo while reducing truck traffic on the interstate system and freeing up the flow of passenger vehicles on those same federal interstate highways. Implementation of my truck management program, which will include night movement of container truck traffic, may be tested very soon. This will help alleviate the current problem. But we must begin work now on the CTC for the long term solution.

In closing, I commend the Chairmen of both the full Public Works and Transportation Committee and the Surface Transportation Subcommittee for holding these hearings, the location of which I suspect is no accident, and I look forward to receiving legislative proposals as they are developed in Committee. I further pledge my active support in the early enactment of a reauthorization bill in the 102nd Congress. A strong national infrastructure is essential to the cities, states and the country, and I am and will continue to be a vigorous supporter of the national highway and transit network that builds on solid local planning and agreed-on national priorities.

TESTIMONY OF

EVAN ANDERSON BRAUDE

COUNCILMAN, FIRST DISTRICT
CITY OF LONG BEACH, CALIFORNIA

ON BEHALF OF

THE CITY OF LONG BEACH

AND

CITIZENS FOR RELIABLE AND SAFE HIGHWAYS (C.R.A.S.H)

UNITED STATES HOUSE OF REPRESENTATIVES
COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION
SUBCOMMITTEE ON SURFACE TRANSPORTATION

LONG BEACH, CALIFORNIA

JULY 2, 1990

CHAIRMAN ANDERSON, CHAIRMAN MINETA, AND DISTINGUISHED MEMBERS OF THE SUBCOMMITTEE, GOOD MORNING. MY NAME IS EVAN ANDERSON BRAUDE AND I AM THE COUNCILMAN FROM THE FIRST DISTRICT OF THE CITY OF LONG BEACH. I AM HERE TODAY REPRESENTING TWO ORGANIZATIONS: THE CITY OF LONG BEACH AND C.R.A.S.H. (CITIZENS FOR RELIABLE AND SAFE HIGHWAYS). LET ME WELCOME YOU HERE TODAY TO OUR GREAT CITY ON BEHALF OF MAYOR ERNIE KELL, THE CITY COUNCIL, AND ALL THE CITIZENS OF LONG BEACH. WE ARE HAPPY THAT YOU CHOSE LONG BEACH AS THE SITE OF ONE OF YOUR FIELD HEARINGS ON THE REAUTHORIZATION OF THE POST-INTERSTATE SURFACE TRANSPORTATION PROGRAMS.

LONG BEACH HAS MANY MODES OF TRANSPORTATION. WE HAVE THREE INTERSTATE HIGHWAYS AND A VARIETY OF STATE ROUTES RUNNING THROUGH OUR CITY. OUR PUBLIC BUS SYSTEM, LONG BEACH TRANSIT, IS RATED THE NUMBER ONE PUBLIC BUS COMPANY IN NORTH AMERICA. ON JULY 14TH, LONG BEACH WILL BE HOME TO THE METRO BLUE LINE LIGHT RAIL SYSTEM LINKING DOWNTOWN LONG BEACH WITH LOS ANGELES. THIS LINE, BUILT BY THE LOS ANGELES COUNTY TRANSPORTATION COMMISSION AND OPERATED BY THE SOUTHERN CALIFORNIA RAPID TRANSIT DISTRICT, WAS COMPLETED WITH NO FEDERAL FUNDS.

CLEARLY THE CITY OF LONG BEACH RECOGNIZES THE IMPORTANCE OF TRANSPORTATION. THESE IMPROVEMENTS HAVE TO BE ACCOMPLISHED THROUGH INTERGOVERNMENTAL AND PUBLIC/PRIVATE PARTNERSHIP IN ORDER TO ALLOW NECESSARY GROWTH WITHOUT ENDANGERING THE QUALITY OF LIFE OF OUR COMMUNITY.

TODAY I WOULD LIKE TO TALK ABOUT THREE PROJECTS THAT WITH THE SUPPORT OF THE CONGRESS WILL HELP MAKE A POSITIVE IMPACT ON OUR TRANSPORTATION INFRASTRUCTURE.

THE CONSOLIDATED TRANSPORTATION CORRIDOR PROJECT, A DEDICATED RAIL AND TRUCK ROADWAY FROM THE PORTS TO THE RAILYARDS IN EAST LOS ANGELES, IS ESSENTIAL TO MOVING GOODS IN AND OUT OF THE PORTS OF LONG BEACH AND LOS ANGELES. IMPROVED ROAD AND RAIL ACCESS TO THE PORTS WILL NOT ONLY HELP THESE PORTS GROW BUT REDUCE NOISE AND DISRUPTION IN NEIGHBORHOODS IN LONG BEACH.

THE REASON THAT THIS PROJECT MAKES SENSE IS THAT IT WILL INSTALL DOUBLE TRACKING OF THE SAN PEDRO BRANCH OF THE SOUTHERN PACIFIC RAILROAD AND INSTALL CENTRALIZED TRAFFIC CONTROL. THE GOAL IS TO HAVE ALL THREE RAIL CARRIERS (THE UNION PACIFIC, THE SANTA FE, AND THE SOUTHERN PACIFIC) USE THIS ONE UPGRADED ROUTE. THE SOUTHERN PACIFIC SAN PEDRO BRANCH RUNS THROUGH A PREDOMINATELY INDUSTRIAL CORRIDOR, WHICH IS MORE COMPATIBLE WITH HEAVY FREIGHT TRAINS THAN THE

OTHER RAILROAD BRANCH LINES, WHICH INCLUDE PORTIONS OF RESIDENTIAL WEST LONG BEACH.

THE PROJECT ALSO INVOLVES WIDENING ALAMEDA STREET FROM FOUR TO SIX LANES FROM THE PORTS TO INTERSTATE 10. FUNDS FOR THREE OF THE GRADE SEPARATIONS AND FUNDS FOR THE WIDENING OF ALAMEDA STREET SOUTH OF STATE ROUTE 91 ARE ALREADY AVAILABLE THROUGH THE ASSISTANCE OF CHAIRMAN ANDERSON AND MEMBERS OF THE COMMITTEE. THE PORTS ACCESS DEMONSTRATION PROJECTS, FUNDED IN 1982 AND 1987, HAVE BEEN A MAJOR FACTOR IN THE PORTS' CONTINUED SUCCESSES.

SUPPORT FOR THIS PROJECT HAS ALSO COME FROM THE CITIZENS OF CALIFORNIA. THANKS TO THE PASSAGE OF STATE PROPOSITION 116 LAST MONTH, $80 MILLION HAS BEEN SPECIFICALLY EARMARKED FOR GRADE SEPARATIONS ALONG THE ALAMEDA STREET CORRIDOR.

THE STATE OF CALIFORNIA AND LOCAL GOVERNMENTS THROUGHOUT THE AREA ARE ALREADY MAKING SIGNIFICANT CONTRIBUTIONS TO THE PROJECT, HOWEVER, WE FEEL THAT FEDERAL ASSISTANCE IS ALSO JUSTIFIED. THE PORTS OF LONG BEACH AND LOS ANGELES PLAY AN IMPORTANT ROLE IN NATIONAL DEFENSE, TRADE AND ECONOMIC DEVELOPMENT FOR THE NATION. SPECIFIC FEDERAL SUPPORT IS APPROPRIATE TO ADD TO THE SUPPORT THAT THE STATE, LOCAL GOVERNMENTS AND THE CITIZENS OF CALIFORNIA HAVE ALREADY GIVEN IN SUPPORT OF THE COMPLETION OF THIS PROJECT.

THE SECOND ISSUE OF CONCERN TO THE CITY IS THE IMPROVEMENT OF THE INTERSTATE HIGHWAYS THAT CURRENTLY RUN THROUGH LONG BEACH. THE LONG BEACH (INTERSTATE 710), SAN DIEGO (INTERSTATE 405), AND SAN GABRIEL RIVER (INTERSTATE 605) FREEWAYS ARE AN IMPORTANT PART OF THE REGION'S TRANSPORTATION SYSTEM.

THE CITY OF LONG BEACH SUPPORTS THE ADDITION OF HIGH OCCUPANCY VEHICLE LANES TO THESE FREEWAYS IN EACH DIRECTION SO THAT BUSES, CARPOOLS, AND VANPOOLS CAN AVOID CONGESTION AND PROVIDE EFFICIENT AND EFFECTIVE COMMUTER MOBILITY. FUNDING FOR SUCH FREEWAY HIGH OCCUPANCY VEHICLE LANES SHOULD BE INCLUDED IN THE 1991 SURFACE TRANSPORTATION AUTHORIZATION ACT.

ONE INNOVATIVE WAY THAT THE CITY OF LONG BEACH IS TRYING TO MITIGATE TRAFFIC PROBLEMS IN THE CITY IS THROUGH THE LONG BEACH AIRPORT SURFACE ACCESS PROJECT. THIS PROJECT WOULD CREATE AN ASSESSMENT DISTRICT AROUND THE LONG BEACH AIRPORT TO FUND $24 MILLION IN TRAFFIC IMPROVEMENTS. THIS PROJECT IS UNIQUE IN MANY WAYS. FIRST, IT BRINGS THE CITY AND BUSINESS OWNERS IN THE AREA TOGETHER IN A JOINT PROJECT TO MAKE MANY NEEDED IMPROVEMENTS CAUSED BY THE CONTINUED DEVELOPMENT AT OR NEAR THE AIRPORT.

THE MC DONNELL DOUGLAS CORPORATION IS ON THE GROUNDS OF THE AIRPORT. DOUGLAS AIRCRAFT IS A LEADER AMONG AMERICAN

MANUFACTURERS OF COMMERCIAL AND MILITARY AIRCRAFT. LAST WINTER, DOUGLAS' LATEST COMMERCIAL JET, THE MD-11, WAS ROLLED OUT FOR THE FIRST TIME WHILE PRODUCTION CONTINUES ON THE C-17, A NEW MILITARY TRANSPORT. AS DOUGLAS CONTINUES TO INCREASE ITS PRODUCTION, OTHER COMMERCIAL AND OFFICE CENTERS HAVE GROWN AROUND THE AIRPORT.

THE LONG BEACH AIRPORT SURFACE ACCESS PROJECT WOULD BENEFIT OUR NATIONAL DEFENSE AND COMMERCIAL AVIATION INDUSTRY BY ALLOWING FOR NECESSARY MANAGEMENT OF THE INCREASED TRAFFIC CAUSED BY DOUGLAS AIRCRAFT'S OPERATIONS AS WELL AS STRENGTHEN OUR LOCAL AND REGIONAL ECONOMIES BY ASSISTING THE GROWTH OF THE BUSINESSES LOCATING NEAR THE AIRPORT. THIS PROJECT WILL ALLOW ALL OF THIS GROWTH TO OCCUR WITHOUT A NEGATIVE IMPACT ON THE NEARBY RESIDENTIAL AREAS.

THE PROJECTS I HAVE DISCUSSED SO FAR HAVE BOTH REGIONAL AND NATIONAL IMPACTS THAT INVOLVE BOTH THE STATE AND FEDERAL GOVERNMENTS AND THE PRIVATE SECTOR. LONG BEACH IS ALSO VERY CONCERNED ABOUT THE TRANSPORTATION NEEDS OF OUR OWN COMMUNITY.

THE CITY HAS IDENTIFIED A TOTAL PACKAGE OF $232 MILLION IN TRANSPORTATION IMPROVEMENTS THAT ARE ESSENTIAL TO THE GROWTH AND WELL-BEING OF THE COMMUNITY. THE PACKAGE IS BALANCED BETWEEN AUTO AND TRANSIT, AND ITS FUNDING IS DIVIDED BETWEEN PUBLIC AND PRIVATE SOURCES. THROUGH STATE-OF-THE-ART

COMPUTER MODELING, THE CITY HAS IDENTIFIED THE MAJOR TRAFFIC BOTTLENECKS IN ITS ROAD SYSTEM THAT CAUSE INORDINATE POLLUTION, CONGESTION AND DELAY.

ONE SUCH PROBLEM IS THE "IRON TRIANGLE" IN EAST LONG BEACH, WHERE THE PACIFIC COAST HIGHWAY (STATE ROUTE 1), SEVENTH STREET (STATE ROUTE 22), AND BELLFLOWER BOULEVARD ALL INTERSECT AND CAUSE OVER 100,000 VEHICLES PER DAY TO CRAWL THROUGH INADEQUATE AT-GRADE SIGNALIZED INTERSECTIONS THAT DO NOT HAVE THE CAPACITY TO MEET EVER-GROWING TRAFFIC VOLUMES TO AND FROM ORANGE COUNTY. THE SOLUTION IS A GRADE-SEPARATION TO INCREASE ROAD CAPACITIES FOR MAJOR TRAFFIC FLOWS. THE COST OF SUCH A PROJECT IN THAT LOCATION IS ABOUT $40 MILLION.

THE 1991 SURFACE TRANSPORTATION AUTHORIZATION ACT SHOULD PROVIDE FOR RELIABLE AND FLEXIBLE FUNDING TO CITIES THAT ARE READY TO IMPLEMENT A BALANCED, COMPREHENSIVE TRANSPORTATION PROGRAM SUCH AS THE ONE WE ARE NOW BEGINNING.

CHAIRMAN ANDERSON, CHAIRMAN MINETA AND MEMBERS OF THE SUBCOMMITTEE, THANK YOU ONCE AGAIN FOR COMING TO LONG BEACH TODAY. YOU COULD HAVE PICKED NO BETTER CITY TO FOCUS ATTENTION ON THE NEED FOR TRANSPORTATION IMPROVEMENTS. THE CITY OF LONG BEACH HAS TAKEN THE LEAD IN MANY AREAS TO ADDRESS IMPORTANT TRANSPORTATION ISSUES WITH THE HELP OF SURROUNDING GOVERNMENTS. WE WILL CONTINUE TO IMPLEMENT

SOLUTIONS TO MITIGATE TRAFFIC CONGESTION. HOWEVER, THE HELP AND SUPPORT OF CONGRESS IS ALSO NEEDED TO SEE US THROUGH ALL OF THESE SOLUTIONS.

THE OTHER HAT THAT I AM WEARING TODAY IS TO REPRESENT C.R.A.S.H. (CITIZENS FOR RELIABLE AND SAFE HIGHWAYS). THIS IS AN ORGANIZATION OF CITIZENS WHO ARE CONCERNED ABOUT A VARIETY OF TRANSPORTATION ISSUES. I WOULD LIKE TO TALK ABOUT TRIPLE AND TWIN FORTY-EIGHT FOOT TRAILERS BEING ALLOWED ON OUR NATION'S STATE HIGHWAYS AND STREETS. THE USE OF THESE TRAILERS WOULD NOT ONLY CAUSE MUCH UNNEEDED CONGESTION ON OUR HIGHWAYS, BUT ALSO PRESENT SEVERAL SERIOUS SAFETY HAZARDS.

THE AMERICAN TRUCKING ASSOCIATION HAS PROPOSED THAT TWIN 48'S AND TRIPLES BE ALLOWED NOT ONLY ON THE 44,000 MILES OF INTERSTATE HIGHWAYS, BUT ALSO ON AN ADDITIONAL 100,000 TO 120,000 MILES OF SECONDARY ROADS. THE PRESIDENT OF THE CALIFORNIA TRUCKING ASSOCIATION HAS EVEN BEEN QUOTED AS SUGGESTING THAT TWIN 48'S MIGHT BE ALLOWED ON CITY STREETS. HOWEVER, EVEN IF TRIPLES AND TWIN 48'S ARE NOT EXPRESSLY ALLOWED ON CITY STREETS, THEY WILL STILL BE ALLOWED ON ALMOST ALL CITY STREETS BECAUSE OF THE "REASONABLE ACCESS" PROVISIONS THAT WILL ALLOW THOSE HUGE TRUCKS OFF THE HIGHWAYS SO THEY HAVE "ACCESS" TO "TERMINALS," FUEL AND FOOD.

I HAVE CONDUCTED A QUICK ANALYSIS OF WHERE IN LONG BEACH TWIN 48'S AND TRIPLES WILL NOT BE ALLOWED. AS YOU CAN SEE FROM THIS MAP, THEY WILL BE ALLOWED JUST ABOUT EVERYWHERE IN LONG BEACH.

THE AMERICAN AUTOMOBILE ASSOCIATION FOUNDATION IN AN 1985 STUDY CONCLUDED THAT THE COST OF TRUCK ACCIDENTS IN LOS ANGELES COUNTY WAS $190 MILLION. $120 MILLION OF THAT COST WAS THE LOST TIME FOR PASSENGERS IN AUTOS STUCK IN GRIDLOCK CAUSED BY TRUCK ACCIDENTS. TRIPLES AND TWIN 48'S WILL ALSO TAKE UP MORE SPACE ON HIGHWAYS AND STREETS THAT ARE ALREADY OVERCROWDED. THE STUDY WENT ON TO FIND THAT IF TRIPLES AND TWIN 48'S ARE APPROVED, NOT ONLY WILL THERE BE MORE ACCIDENTS, BUT THE ACCIDENTS WILL BLOCK MORE LANES OF TRAFFIC.

THIS FINDING WAS BORNE OUT THIS PAST MAY 27TH IN PORTLAND WHERE A 37-YEAR-OLD MAN WAS KILLED AND SEVEN OTHERS WERE INJURED WHEN A TRIPLE TRAILER SLAMMED THROUGH A CONCRETE BARRIER ON INTERSTATE 5 AND COLLIDED HEAD ON WITH ONCOMING TRAFFIC. THE COLLISION OCCURRED WHEN THE TRAILER LOST CONTROL GOING THROUGH A POOL OF WATER THAT COLLECTED ON THE HIGHWAY DURING A HEAVY RAIN. AS THE TRAILER WENT OUT OF CONTROL, THE DRIVER OVER-CORRECTED, WHEN HE STRUCK A CONCRETE WALL, HIS TRUCK CAREENED ACROSS THE SOUTHBOUND LANES SLAMMING INTO THE CONCRETE BARRIER ON THE OTHER SIDE. THIS ACCIDENT BLOCKED LANES OF INTERSTATE 5 FOR EIGHT HOURS.

THIS ACCIDENT IN PORTLAND NOT ONLY DEMONSTRATES THE CONGESTION PROBLEMS AN ACCIDENT LIKE THIS CAN CAUSE, BUT ALSO RAISES MANY CONCERNS ABOUT THE SAFETY OF TRIPLES AND TWIN 48'S.

ALL OF US HAVE DRIVEN HIGHWAYS SURROUNDED BY TRUCKS. THE POTENTIAL HAZARDS THAT THESE TRAILERS TODAY PRESENT ARE STAGGERING, BUT THE THOUGHT OF HAVING EVEN LARGER TRAILERS ON OUR STREETS AND HIGHWAYS SEEMS TOTALLY INCOMPATIBLE WITH AUTOMOBILE TRAFFIC.

NOT ONLY WOULD THESE TRAILERS PRESENT A HAZARD ON THE STREETS, BUT THE ON-AND OFF-RAMPS IN LONG BEACH FOR OUR INTERSTATE HIGHWAYS ARE NOT LARGE ENOUGH TO ACCOMMODATE THE SWEEPING TURNS THAT TRIPLES AND TWIN 48'S MUST TAKE WHEN TURNING. WITHOUT NECESSARY COSTLY ADJUSTMENTS, THESE TRAILERS WOULD RUN OVER SIDEWALKS, LAWNS AND POSSIBLY EVEN PEDESTRIANS.

THE TRUE DANGERS ASSOCIATED WITH TRIPLES AND TWIN 48'S WERE DETAILED IN A STUDY BY THE CALIFORNIA HIGHWAY PATROL. SOME OF THE HAZARDS ASSOCIATED WITH THESE TRAILERS IF THEIR USE WERE EXPANDED INCLUDE:

- VAST AMOUNTS OF HAZARDOUS MATERIALS WOULD BE DIVERTED FROM RAILROAD TANKCARS TO HIGHWAY TANK TRUCKS;
- DOUBLE TRAILER TANK TRUCKS HAD A SIGNIFICANTLY GREATER PROPORTION OF CRASHES INVOLVING OVERTURNS THAN SINGLE TRAILER TANK TRUCKS;
- TANK STRAIGHT TRUCKS AND SINGLE TRACTOR TRAILERS OVERTURNED IN 50% OF THEIR CRASHES;

- STRAIGHT TRUCKS PULLING A SINGLE TRAILER OVERTURNED IN 60% OF THEIR CRASHES;
- TANK TRUCKS WITH DOUBLE TRAILERS HAD OVERTURNS IN 70% OF THEIR CRASHES.

OF PARTICULAR IMPORTANCE WERE THE NUMBER OF DOUBLE CRASHES INVOLVING OVERTURNS OF THE LAST TRAILER. I QUOTE FROM THE CHP REPORT:

> "THE LAST TRAILER IN A SET OF DOUBLES WAS PARTICULARLY SUSCEPTIBLE TO OVERTURN. THE REAR TRAILER WAS THE ONLY VEHICLE THAT OVERTURNED IN ALMOST TWO-THIRDS OF THE OVERTURNS INVOLVING SETS OF DOUBLES AND IN CLOSE TO HALF OF THE OVERTURNS INVOLVING TRUCKS AND FULL TRAILERS."

THESE ACCIDENTS INVOLVING OVERTURN OF ONLY THE SECOND TRAILER WOULD NOT HAVE OCCURRED HAD THE INVOLVED TRUCK BEEN HAULING ONLY ONE TRAILER.

CHAIRMAN ANDERSON, CHAIRMAN MINETA, AND MEMBERS OF THE SUBCOMMITTEE, TRIPLE AND DOUBLE 48 TRAILERS SHOULD NOT BE ALLOWED ON THE STREETS AND STATE HIGHWAYS OF LONG BEACH, CALIFORNIA OR ELSEWHERE IN THE UNITED STATES. IT IS CLEAR THAT THE CONGESTION THAT THESE TRAILERS WOULD CAUSE WOULD AGGRAVATE AN ALREADY HEAVILY IMPACTED TRANSPORTATION INFRASTRUCTURE ADDING TO OUR TRAFFIC GRIDLOCK. IN ADDITION, THESE TRAILERS WOULD POSE A GRAVE SAFETY HAZARD IN THE EVENT OF A COLLISION. THIS DANGER COULD COME FROM THE SPILL OF

TOXIC CHEMICALS, TRAILERS RUNNING INTO AUTOMOBILES OR OTHER TRAILERS, OR FROM VEHICLE COLLISIONS CAUSED BY SPILLED CARGO FROM THE TRAILERS, OR A COMBINATION OF ALL THREE.

THANK YOU FOR THE OPPORTUNITY TO SPEAK TODAY ON BEHALF OF C.R.A.S.H. I WOULD BE HAPPY TO ANSWER ANY QUESTIONS.

Testimony of Governor Edmund G. "Pat" Brown
Surface Transportation Subcommittee
Long Beach, California -- July 2, 1990

Chairman Mineta, Chairman Anderson and members of the Subcommittee: I am Edmund G. "Pat" Brown, former governor of the state of California and a member of the board of CRASH -- Citizens for Reliable and Safe Highways. I am here today to voice my opposition to proposals that would allow Congress to authorize triple trailer trucks and twin 48-foot trucks.

It is a particular pleasure for me to appear before Chairman Anderson, who was my running mate when I was a candidate for governor, and then Lieutenant Governor during the eight years I was governor. I believe we made a fine team.

One of Chairman Anderson's and my finest accomplishments while we governed California was to pioneer the California freeway system. I believe we provided our state not only with the best highway system in the nation, but also with the safest.

I worry, however, that California's highway system is breaking down. Not only is the pavement itself deteriorating, but the urban parts of our state seem to be approaching gridlock.

Our highways are no longer reliable. We cannot rely on what should be a twenty-minute trip taking twenty minutes. Frequently, what should be a twenty-minute trip takes forty minutes or even an hour. Sometimes this is because there are just too many cars and trucks on the road. Sometimes it is because of an auto accident. All too frequently, however, it is because a big truck overturned, like the double trailer tank truck that overturned last Thursday ten miles from here on the Lakewood Blvd. on-ramp to the Artesia

Freeway.

That double trailer tank truck crash spewed seven hundred gallons of diesel fuel onto the freeway and caused congestion all day long.

I believe double trailer trucks -- like the one that overturned last Thursday -- are unstable and unsafe. As a California Highway Patrol study demonstrated, double trailer tank trucks have a substantially higher incidence of overturn than do single trailer tank trucks.

I do not pretend, however, to be an expert on truck safety, or even to have read all the complex and apparently conflicting studies on the subject. My conclusion that double trailer trucks are unsafe comes from conversations with experts on the subject.

If double trailer trucks with three articulation joints are unsafe, common sense tells me that triple trailer trucks one-third the size of a football field must be even more dangerous. The experts tell us the same thing.

The experts tell us that triple trailer trucks have five articulation joints and that the more articulation joints a vehicle has, the more dangerous the vehicle.

The experts tell us that the third trailer of a triple trailer truck sways back and forth as much as four feet on a windless day on a straight freeway.

The experts tell us that the "crack-the-whip" effect -- which causes trucks to overturn -- is three and one-half times as great for triple trailer trucks as it is for single trailer trucks.

The experts give us many other reasons not to like triples and

the even more mammoth twin 48's. But I do not need an expert to tell me that it takes much longer to pass a triple or twin 48 on dangerous two-way highways. Nor do I need an expert to tell me that the freeway on and off ramps here in Long Beach were not designed to accommodate these monster trucks.

In my opinion, if Congress authorizes triples and twin 48's, there will be many more truck crashes than there are today. Many more lives will be lost. Many more will live the rest of their lives with crippling injuries. And congestion will become radically worse as triples and twin 48's block traffic for miles.

Therefore, I urge you to adopt the goals of CRASH -- Citizens for Reliable and Safe Highways -- as your own. Let's work together to make our highways reliable and safe.

AMERICA'S COALITION FOR

TRANSIT NOW

TESTIMONY OF

Mr. Thomas Conneely
President
Association of California Insurance Companies

Mr James Snyder
President
Personal Insurance Federation of California

on behalf of

AMERICA'S COALITION FOR
TRANSIT NOW

before the

COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION

UNITED STATES HOUSE OF REPRESENTATIVES

Field Hearing
Long Beach, California
Council Chamber
City Hall
3 P.M.
July 2, 1990

AMERICA'S FUTURE RIDES ON TRANSIT
BUS • SUBWAY • LIGHT RAIL • HOV LANE • CARPOOL • VANPOOL • COMMUTER RAIL • HIGH SPEED RAIL
1317 F STREET, NW 6TH FLOOR WASHINGTON, DC 20004 202-638-0215 FAX 638-7045

Mr. Chairman, we are pleased to appear before you today on behalf of America's Coalition for Transit NOW.

The Transit NOW coalition is made up of over sixty national organizations, including the three major insurance trade associations, labor unions, environmental groups, senior citizen advocacy organizations, investment bankers, transit systems and others who provide public transportation, consumer groups, and other varied organizations.

As many have observed, this is a very unusual array of interests. We have come together to support a major increase in federal funding for public transportation. The diversity of Transit NOW's membership demonstrates the breadth of benefits that expanded and improved transit systems and services offer for all Americans.

Too often, Americans think of transit as the other way people get around, if they think about it at all. But as each of us confronts increasing problems of mobility and congestion, dirty air and inefficient land use, declining productivity and growing reliance on imported oil, we must come to see that public transportation offers solutions to each of these problems.

I will touch briefly on each of these points and then more specifically address the benefits transit offers to control the cost of insurance.

ECONOMIC IMPACT/COMPETITIVENESS

Everywhere, congestion is a major cause of declining economic productivity. Nationally, 2 trillion hours are wasted each year while we sit in traffic. In the next 20 years urban and suburban travel is projected to increase by 400 percent on the nation's freeways, and by 200 percent on other roads.

And as congestion diminishes our productivity, our economic competitors are making massive investments in their transportation infrastructure:

- Spain is investing $22 billion to rebuild its national rail network.
- West Germany is investing $12 billion to build an intercity high-speed rail network.
- Scandinavian countries are building Scanlink at a cost of $6 billion to connect Scandinavian rail and road systems to Europe.
- Switzerland is spending $8 billion to build trans-Alpine rail tunnels to Italy and an additional $5 billion on a new rail and bus network.
- The British and French are building the Channel Tunnel at a cost of $12 billion to accommodate 80 mph rail traffic.
- The French high-speed rail network is being expanded to Lille and Calais tying France, and all of Europe, into a network including Brussels, Amsterdam, Cologne and London.

These figures are just for the emerging European Community. Japan's bullet trains are legend, and they, too, are being expanded and improved.

The U.S. is the world's leading debtor nation. A major contributor to our trade imbalance is the growth in oil imports. In January 1990, 54 percent of the nation's oil supply was imported. The impact on our balance of trade is substantial. The Department of Energy recently reported that in the first 11 months of 1989, the cost of imported energy, nearly all oil, represented 38.5 percent of the $102.4 billion trade deficit in those months. Transportation accounts for 65 percent of petroleum use.

Reducing the use of oil products for transportation by increasing the use of shared ride modes of transportation will result in a decline in the demand for imported oil. For instance, 30 million to 40 million gallons of gasoline would be saved each day if average commuter vehicle occupancy were increased from 1.1 passengers per vehicle to 2.1 passengers per vehicle:

Mr. Chairman, we can't continue down this road.

ENVIRONMENT/AIR QUALITY/HEALTH

Similarly, the quality of our air has declined in virtually every community. As a result, our environment and our health have suffered. It is well documented that the major source of air pollution is motor vehicles.

- One third of carbon dioxide -- the most significant cause of global warming -- comes from transportation sources.
- Transportation sources cause 40 to 60 percent of pollution that produces ozone. Ozone standards were violated regularly in 101 U.S. cities in recent years.
- Transportation also accounted for 70 to 80 percent of carbon monoxide emissions, with those standards being exceeded in 44 metropolitan areas.
- A consequence of this motor vehicle pollution is 110 million Americans breathing dirty air, according to the federal Environmental Protection Agency.
- The cost to our health is staggering, with over $40 billion spent on air-pollution related illnesses each year. The American Lung Association reports that 110,000 people die yearly from auto pollution.

Mr. Chairman, we can't continue down this road.

We all hope that the soon to be enacted Clean Air Act will result in improving our air quality. But even these efforts will not be enough. Integral to our nation's efforts to clean the air must be a renewed commitment to making public transit available to all Americans, to offering meaningful transit choices other than one person per car.

MOBILITY

However, economic competitiveness and air quality are not the only reasons America needs an improved public transportation system.

For 65 million transportation disadvantaged Americans -- people with disabilities, older Americans and rural residents in particular -- our under funded transit system has meant less mobility and fewer opportunities to contribute to society and maintain their independence. Limited public transit also condemns many rural communities to slow economic death.

THE IMPACT OF CONGESTION ON AUTO INSURANCE RATES

In recent years the high cost of auto insurance in some of our urban areas has become a major political issue. That is certainly the case in California, where auto insurers are confronted with myriad problems, including more claims and skyrocketing medical, legal, and auto repair bills. Urban areas often face the most severe problems, largely due to congestion, higher accident rates, and higher costs associated with losses.

A recent study by the Insurance Services Office and the National Association of Independent Insurers, entitled "Factors Affecting Urban Auto Insurance Costs," found that bodily injury liability claims in Los Angeles occurred 2.4 times more frequently than in the State of California as a whole. Similar rates of frequency are being experienced in Philadelphia, Baltimore, Newark, Boston, Chicago, Cleveland, Miami, and New York City.

Insurance statistics are very clear. Increased congestion leads to greater insured losses and higher auto insurance rates. However, the insurance industry is not satisfied to simply record this phenomenon and pass it on to consumers in the form of higher insurance rates. Insurers are engaged in a variety of efforts to make our roads safer, reduce drunk driving, and to lower the costs of repair.

Greater use of mass transit and improved mass transportation systems will lead to a reduction in congestion and ultimately to fewer accidents, injuries and fatalities. Insurers have a vested interest in these issues and will continue to work with organizations with similar goals such as those in Transit NOW. We are proud to join with business, labor, and consumers in urging increased funding for mass transit.

We need more effective public transportation and greater education on public transportation services to reduce traffic injuries and deaths, for a cleaner environment, for the economy and for insurance consumers.

We need more Transit NOW!

Mr. Chairman thank you for the opportunity to appear before the Committee, and I would be happy to answer any questions you or the other Members of the Committee may have.

SENATOR ED DAVIS TESTIMONY
JULY 2, 1990
HOUSE COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION
HEARING ON HR 3389-FREEWAY BILLBOARDS
LONG BEACH, CALIFORNIA

IT IS MY PLEASURE TO HAVE THE OPPORTUNITY TO PRESENT TESTIMONY TO YOU TODAY IN SUPPORT OF CONGRESSIONAL EFFORTS TO AMEND THE FEDERAL HIGHWAY BEAUTIFICATION ACT TO ALLOW LOCAL GOVERNMENTS TO MORE EQUITABLY DEAL WITH NON-CONFORMING LAND USES IN THEIR JURISDICTIONS.

I HAVE BEEN A CALIFORNIA STATE SENATOR SINCE 1980 AND HAVE HAD THE PRIVILEGE OF REPRESENTING AREAS IN VENTURA COUNTY, SANTA BARBARA COUNTY, AND NORTHERN LOS ANGELES COUNTY. THESE REGIONS ARE BEAUTIFUL AREAS WITH CONTRASTING NEW URBAN COMMUNITIES AND EXTRAORDINARY NATURAL AREAS. IN MANY CASES THESE AREAS ARE DEFINED BY THEIR SURROUNDING MAJOR FREEWAYS. FOR EXAMPLE, INTERSTATE 5 BISECTS NORTHERN LOS ANGELES COUNTY ON ITS WAY TO OREGON, WHILE THE 101 FREEWAY WINDS ITSELF THROUGH THE SANTA MONICA MOUNTAINS NATIONAL RECREATION AREA UP THE CALIFORNIA COAST.

FOR THE PAST SEVERAL YEARS I HAVE ATTEMPTED TO ASSIST THE LOCAL GOVERNMENTS IN MY DISTRICT, SPEARHEADED BY THE CITY OF AGOURA HILLS, TO IMPROVE THE SCENIC BEAUTY OF THEIR COMMUNITIES BY ADOPTING STATE LEGISLATION.

PAGE TWO
SENATOR ED DAVIS TESTIMONY
HR 3389
JULY 2, 1990

IN 1988 MY LEGISLATION, SB 1879 (CHAPTER 654, STATS. 1988) ADOPTED SCENIC HIGHWAY DESIGNATION FOR THE 101 FREEWAY FROM THE SAN FERNANDO VALLEY, THROUGH AGOURA HILLS, WHICH IS LOCATED WITHIN THE SANTA MONICA MOUNTAINS NATIONAL RECREATION AREA, UP TO SANTA BARBARA COUNTY. I AUTHORED THIS MEASURE BECAUSE THE 101 FREEWAY IS THE NATURAL DESCENDANT OF THE VENERABLE EL CAMINO REAL OF ANTIQUITY, AND CONSTITUTES AN INTEGRAL LINK WITH OUR RICH SPANISH HERITAGE THAT MUST BE SAVED. THE 101 FREEWAY WINDS THROUGH TERRAIN NATIONALLY RENOWNED FOR ITS UNIQUE SPLENDOR. THIS LEGISLATION IS THE FIRST STEP IN THE PROCESS THAT COULD RESULT IN THE ADOPTION OF VERY STRICT ENVIRONMENTAL CONTROL ALONG THIS FREEWAY.

UNDER CALIFORNIA STREETS AND HIGHWAYS CODE SECTION 261, AND STANDARDS ADOPTED BY THE STATE TRANSPORTATION DEPARTMENT, A CITY MUST TAKE ADDITIONAL STEPS TO REGULATE THE DENSITY OF LAND USE; HAVE NATURAL AREAS MAINTAINED, OR APPROPRIATELY LANDSCAPED; AND CONTROL OUTDOOR ADVERTISING.

THE PROBLEM FACING THE CITY OF AGOURA HILLS, AND SEVERAL OTHER CITIES AND COUNTIES IN CALIFORNIA, IS THAT THE FEDERAL HIGHWAY BEAUTIFICATION ACT MAKES IT FINANCIALLY IMPOSSIBLE FOR LOCAL GOVERNMENT TO ENACT REASONABLE SIGN ORDINANCES WHICH REMOVE BILLBOARDS WITHIN 660 FEET OF A FREEWAY. WHEN I ATTEMPTED TO

38-253 O--91——69

PAGE THREE
SENATOR ED DAVIS TESTIMONY
HR 3389
JULY 2, 1990

PASS LEGISLATION IN THE STATE SENATE TO ALLOW LOCAL GOVERNMENTS TO COMPENSATE THE BILLBOARD COMPANIES BY AMORTIZING THE BILLBOARD OVER A SEVEN YEAR PERIOD, WHICH IS NOW ALLOWED FOR POLE SIGNS, I WAS INFORMED THAT WE WERE IN CONFLICT WITH THE FEDERAL LAW AND WOULD LOSE 10% OF OUR FEDERAL GAS TAX IF WE ENACTED IT.

THE INFORMATION CENTER FOR THE SANTA MONICA MOUNTAINS NATIONAL RECREATION AREA IS NOW LOCATED IN THE CITY OF AGOURA HILLS, WHICH IS RAPIDLY BECOMING A DESTINATION POINT FOR TOURISTS. IT SHOULD BE GIVEN THE OPPORTUNITY TO CHANGE ITS IMAGE FROM THE BILLBOARD CAPITAL OF THE LOS ANGELES AREA, BUT THAT CAN ONLY HAPPEN IF YOU ALLOW THEM TO MAKE LAND USE DECISIONS AT THE LOCAL LEVEL.

BILLBOARD COMPANIES' RIGHTS ARE NO GREATER THAN THOSE OF THE CITIZENS OF MY DISTRICT. I URGE YOU TO RETURN THE ISSUE OF THE REMOVAL OF NON-CONFORMING BILLBOARD USES TO LOCAL GOVERNMENTS. THANK YOU FOR YOUR CONSIDERATION.

TESTIMONY BY GERALD G. GEISMAR
CHAIRMAN OF THE BOARD
EL SEGUNDO EMPLOYERS ASSOCIATION

Presented to:

THE SURFACE TRANSPORTATION SUBCOMMITTEE
of the
HOUSE PUBLIC WORKS COMMITTEE

FIELD HEARING ON
THE REAUTHORIZATION OF THE POST-INTERSTATE
SURFACE TRANSPORTATION PROGRAM

Long Beach, California
July 2, 1990

THE GREEN LIGHT FOR COMMUTERS

Good afternoon Mr. Chairman and members of the Committee. My name is Gerald G. Geismar and I am Vice President and General Manager of the TRW General Services Division. I also serve as Chairman of the Board of Director of the El Segundo Employers Association - ESEA - and it is this latter capacity that I am here before you today.

ESEA is a privately funded, non-profit coalition of aerospace and defense contractors, other major employers, and commercial property owners. ESEA's members, who employ more than 75,000 people in the South Bay area of Los Angeles County alone, include (among others): TRW Inc.; Hughes Aircraft Company; Rockwell International; Northrop Corporation; Xerox Corporation; Computer Sciences Corporation; and Chevron U.S.A.

Since its founding in 1981, ESEA's sole mission has been to help improve the transportation system and to reduce traffic congestion in our area. As such, ESEA is vitally interested in the future of the Federal highway and mass transit programs, and we welcome this opportunity to share our views in regard to what we consider to be a most important issue: good intermodal access, especially as it relates to ports of national and regional significance.

First, however, I'd like to spend just a few moments telling you about ESEA's approach to our surface transportation problems.

- ESEA was perhaps the first Transportation Management Association in California, if not the United States. Almost a decade ago, ESEA's members began to develop and implement Demand Management Strategies such as vanpooling, carpooling, employer subsidized public transit, and alternative work schedules. Long before the term "public-private partnership" became commonplace, ESEA recognized that the private sector has the ability, the opportunity and, indeed, the responsibility to help address our transportation problems. Today, ESEA members are continuing and increasing these efforts to help achieve critical mobility and air quality objectives for our area.

- At the same time, ESEA believes that demand management strategies cannot do the job alone. Public investment in transportation infrastructure - at all levels of government - must be in line with the needs of today and tomorrow. This constitutes the other part of ESEA's overall approach: advocating capacity enhancements on a selective basis to reduce congestion and enhance the South Bay as a place to work, live and do business.

ESEA continues to advocate a multi-modal approach: ridesharing, HOV lanes, rail transit, intersection improvements and arterial widenings are all integral to ESEA's philosophy and strategy. I've asked that copies of ESEA's brochure, which summarizes our approach and accomplishments, be made available to you.

ESEA has long recognized that a good transportation system is critical if American business is to meet the challenges of the global marketplace. One issue which we think deserves special attention is the need to ensure good, intermodal access to airports and seaports. When trips involve transfers from one form of transportation to another, good connections between modes are essential. There is an important and legitimate role for the Federal government to play with regard to this issue, since intermodal access projects tend to be complex, costly and beyond the financial resources which are normally available to state and local jurisdictions.

Here locally, for example, the new interstate I-105 Anderson Freeway, sometimes called the Century Freeway, will be completed in 3 or 4 years, and will terminate just south of Los Angeles International Airport. The key link between the Freeway and the Airport is a tunnel on a local arterial, and studies have shown that this link will be massively overloaded once the Freeway is in operation. ESEA believes this is an excellent example of where the Federal government can and should play an important

role: the cost of expanding the tunnel is simply beyond the reach of State and local government, even with the recent passage of Proposition 111.

It should also be remembered that LAX is in the middle of one of the most highly developed and growing corridors in Los Angeles County. Good surface access is important not only for the over 40 million annual passengers who use LAX and for the billions of dollars worth of freight which are imported and exported there every year, but also for the hundreds of thousands of daily commuters in the area who must use this same congested arterial to get to work. The irony is that completion of a portion of the Federal Interestate system will make access to LAX worse, not better, and will negatively impact area commuters as well.

While the particulars may differ, my impression from traveling throughout the United States is that this is hardly a unique example, but rather one which is typical of en entire genre. As we move into the post-interstate era, ESEA recognizes that roles and responsibilities of all levels of government, and the private sector, with regard to transportation may be changing. We also recognize that budgetary considerations play a role as well. We believe, however, that it is appropriate for Congress and the Administration to take the lead: when national interests are clearly at stake; when the need - in this case, good intermodal connections - is nationwide in scope; when the

solution is beyond the financial capability of local and state governments; and when other Federal programs or projects have significant though unintended adverse impacts.

Thank you very much for your time and attention; I'll be happy to try to answer any questions which you may have.

THE AEROSPACE CORPORATION

AEROSPACE/LAAFS

BICYCLE getting to work THE BEST WAY

Mail to: Commuter Services
M2/351 or call extension 6-POOL

Name _____ Mail Station or AF Office Symbol _____ Ext. _____

Building location _____

Please send me the folloiwng bicycle information:

- ☐ Bike route maps
- ☐ Bike Club
- ☐ Bike locker request

Why not bicycle to work?

As the traffic in El Segundo gets more and more congested and as the cost of owning a car continues to increase, why not bike to work? If you're driving during peak traffic hours, biking may not take much longer.

Many employees already commute to Aerospace by bike on a regular basis. Because bicycling is an efficient way of commuting for individuals who live close to work, Aerospace provides certain conveniences to assist bikers.

Facilities available to bike riders

BICYCLE STANCHIONS are located at the south end of Buildings A2 and A3. These high-security stanchions clamp to your bicycle frame and provide a cable to secure your wheel. You only need to provide a padlock.

Enclosed BICYCLE LOCKERS are located at Buildings A2, A6, and D5. Lockers are assigned by the Bike Club. You need not be a member. Call Commuter Services for current club extension.

BICYCLE RACKS, located at Buildings D4, D6, and D8, are available to employees using their bikes on interfacility visits.

SHOWERS are available for both men and women at Building D3 and at the Air Force gym.

What is the Bike Club?

The Bike Club, part of the AEA Outdoor Sports Club, offers special films and workshops on bicycle repairs, safety in bicycling, and other useful topics. To help you determine the best route to bike to Aerospace, the Outdoor Sports Club can give you the name of an experienced bicyclist who lives near you. An experienced cyclist can ride with you the first time you bike to work and tell you about the shortcuts, bad intersections, potholes, etc.

How can I get more information?

El Segundo and regional bike route maps and information are available f.om Commuter Services. Contact that office at extension 6-POOL or send in the form on the back.

M2/351 or call extension 6-POOL

Name Mail Station or AF Office Symbol Ext

☐ Please send me information about vans from the (city) area.

☐ I would like to start my own vanpool from the (city) area.

☐ with my own van ☐ with a company van

What is a vanpool?

A vanpool consists of approximately 8 to 15 people commuting to work in a van. Generally, one vanpool member acts as the operator in charge of the group. The operator may also be the driver, or several members can share driving responsibilities. The group determines its own rules regarding route, pickup locations and times, smoking, etc., to allow flexibility for individual needs and circumstances. Usually, a vanpool will have one or two central locations near the riders' homes where everyone meets.

Is vanpooling for me?

Vanpooling is ideal for employees who travel 30 miles or more round-trip to work. More than 600 employees at Aerospace and Space Division commute to work in a vanpool. Vanpools are operating from Orange, Riverside, San Bernardino, Ventura, and Los Angeles counties.

What are the advantages?

Statistics indicate that vanpooling is one of the safest forms of transportation—safer than driving alone in a car. The Aerospace vanpool program has accumulated more than 13 million miles since 1975 without a serious accident.

Vanpoolers ride in air-conditioned comfort, with individual seats and reading lights in most vans. Passengers can relax on their way to and from work while reading, catching up on work, or sleeping.

Vanpooling costs less than driving alone.

What does it cost?

Fares are based on the cost of operating the vehicle, which varies depending on the number of miles driven and the number of seats. Vanpool members share these costs on a monthly basis. The driver usually rides for free or shares the free ride with other drivers. The average cost per person for an 80-mile round trip is $68 per month.

Who provides the van?

Three types of vanpools are operated at Aerospace:

- **Company vehicles**. Aerospace provides an in-house vanpool program. Employees pay a monthly fare that covers the company's cost of operating its vans.
- **Owner-operated**. If you own a passenger van, you can use that for commuting with other employees to work. Your passengers help pay the cost of commuting.
- **Vanpool vendors**. Vendors lease a vehicle to a group of commuters for vanpooling. The monthly lease cost includes insurance, maintenance, and licensing.

Will vans allow occasional riders?

Employees who can't ride on a daily basis because of travel, overtime, or other commitments can be casual riders. When a seat is available, casual riders pay to ride on a day-to-day basis.

Tell me more!

If you want more information about a vanpool near you OR you would like to start your own vanpool, fill out the card on back and mail to Commuter Services, M2/351, or call extension 6-POOL.

THE GREEN LIGHT

VOLUME 4 • NUMBER 1 | A PUBLICATION OF THE EL SEGUNDO EMPLOYERS ASSOCIATION | SUMMER 1990

ESEA Board Elects Officers for 1990

At their January meeting, the ESEA Board of Directors unanimously approved the slate of new officers for 1990, including two new positions: Deputy Director-Transportation Demand Management; and Deputy Director-Air Quality and Alternative Fuels. These positions were created to respond to the increase in environmental issues facing ESEA member corporations.

The 1990 officers are: Chairman: Gerald G. Geismar, TRW Inc.; Vice Chairman: Phil Humphries, Chevron, USA-El Segundo; Secretary-Treasurer: Hugh Greenup, Kilroy Industries; Deputy Director-Legislative Affairs: Michael Jackson, TRW Inc.; Deputy Director-Membership: Karen Ackland, Continental Grand Associates; Deputy Director-Transportation Demand Management: Lenny Courselle, Xerox Corporation; Deputy Director-Air Quality and Alternative Fuels: Todd Gerstenberger, Northrop Corporation.

Chairman Gerald G. Geismar is Vice President and General Manager of the General Services Division for the Redondo Beach based Space and Defense Sector of TRW. Mr. Geismar has been involved with major aerospace programs for more than 30 years. Prior to joining TRW, he was Project Manager for Sperry Gyroscope Company and for the U.S. Army at Aberdeen Proving Ground, and Manager of Planning and Control for ARMA Division of AMBAC Industries. He received his B.S. degree in electrical engineering from Union College, Schenectady, New York, and an M.B.A. from Columbia University, Graduate School of Business. Mr. Geismar is active in the community and is an Associate Fellow of the AIAA.

esea

ESEA Successfully Opposes Cuts to Norwalk - El Segundo Light Rail Line

Following five months of intensive lobbying by ESEA and the City of El Segundo, the Los Angeles County Transportation Commission (LACTC) has decided not to eliminate essential features of the Norwalk - El Segundo light rail project. By a 9-2 vote, the LACTC opted to retain all stations and fully automated train control. Power to the system will be via overhead catenary instead of third-rail as originally proposed.

At a special briefing by LACTC staff in early June, 1989, ESEA members were stunned to learn of a cost-cutting proposal which would have limited the system's effectiveness and ability for accommodating future demand on the line. "We understand the need to save money wherever possible," noted Donald Camph, ESEA's Executive Director, "but we felt it would be short-sighted to compromise the system's long term capability to respond to the mobility, air quality and energy conservation challenges of the next 30 years."

El Segundo Mayor Carl Jacobson echoed this sentiment: "The cost-cutting proposal was penny-wise and pound-foolish and would have severely compromised the line's fundamental mission. I'm glad the LACTC chose to keep its commitment to build a system which will meet the community's needs well into the 21st Century."

Although a fully-automated system will cost about $30 million initially, ESEA analyses showed that this will be more than offset by lower operating costs and higher revenues due to increased ridership. "The LACTC staff has estimated that ridership on the line will be as much as 30% higher due to the increased frequency of service made possible by full automation," Camph noted; "this will be critical as ESEA member companies strive to meet their transportation demand management and air quality objectives."

Funding Approved for Aviation-Rosecrans Project

In June, 1989 the Los Angeles County Transportation Commission approved the first phase of the City of Hawthorne's application for $3.0 million in regional Federal Aid Urban (FAU) funds for the Aviation/Rosecrans intersection improvement project. The City of Hawthorne has been designated Lead Agency and will oversee the initial design and engineering phase of this project which includes preparing plans and specifications for the reconstruction of the Santa Fe freight bridge to allow for the widening of the intersection.

The City of Hawthorne has selected the firm of DeLeuw, Cather & Company to perform the design and engineering phase of the Aviation/Rosecrans intersection project. DeLeuw, Cather prepared the original study on the intersection at the request of ESEA in 1987-88. According to Jim Mitsch, Chief of General Services and Public Works for the City of Hawthorne, "DeLeuw, Cather has the qualifications we feel are important to successfully redesign this intersection and we are pleased the cities of Manhattan Beach and El Segundo agree with the selection." The consultants will begin the preliminary engineering phase of the project in the next few months.

ESEA led the effort to secure $900,000 in Federal funds during FY '89 for the design and engineering phase of this intersection project, as well as the extension of Douglas Street.

Major corporations contributing rights-of-way to the Aviation/Rosecrans project are Xerox Corporation, TRW Space & Defense and Continental Development Corporation. These

National Transportation Policy Sets Stage for 21st Century

by Dr. Thomas D. Larson
Federal Highway Administrator

[Ed. Note: Dr. Thomas D. Larson was sworn in as the Nation's 12th Federal Highway Administrator on August 10, 1989. Prior to joining FHWA, Dr. Larson served as a Professor and Administrator at Pennsylvania State University from 1962 to 1979. He was Secretary of Transportation in the Commonwealth of Pennsylvania from 1979 to 1987. Dr. Larson received his B.S., M.S. and Ph.D. in Civil Engineering from Penn State, and has completed post-doctoral studies at M.I.T. and Oklahoma State University.]

Thirty-five years ago, President Eisenhower's goal in establishing the program to build the Interstate Highway System was to "Unite the Nation" in a way that only an effective interchange of people and goods can provide. The Interstate Highway System is now virtually complete, and we have extensive transportation facilities and services in place in other modes. On the ground, over the waterways, in air and space, our mission for the next decade and the next century is to build on those achievements, to ensure connections among all parts of the United States and with the world. Our competitive success in a global economy depends on it.

Toward that end, over the last twelve months, the U.S. Department of Transportation, under the leadership of Secretary Samuel K. Skinner and with the help of thousands of Americans who participated in the Department's outreach efforts, has given time and attention to rethinking our national transportation programs and policies. It has been my privilege to co-direct this effort along with Deputy Secretary Elaine L. Chao. The product of this year long effort, *A Statement of National Transportation Policy: Strategies for Action*, was announced by President Bush at the White House on March 8, 1990.

The National Transportation Policy presents a framework for decision making that will help our transportation system meet the needs of the 21st Century. Now all of us - the Federal government, State and local governments, industry, and private citizens - must work together to put this agenda in motion. To ensure continued vitality of our Nation, we must all participate in making the investments today that will spur productivity and allow transportation to be an engine of tomorrow's growth and prosperity. We need to focus our investment dollars on the areas with highest payback, and we need to take full advantage of new and emerging transportation technologies such as "smart cars and highways" or magnetically levitated trains. At the same time, we must ensure that transportation supports the interests of safety, national security, efficient use of energy, and environmental quality.

The basic direction for the National Transportaiton Policy are captured under six major themes:

- Maintain and expand the Nation's transportation system.
- Foster a sound financial base for transportation.
- Keep the transportation industry strong and competitive.
- Ensure that the transportation system supports public safety and the quality of life.
- Advance U.S. transportation technology and expertise.

The National Transportation Policy sets out the rationales, strategies and actions to accomplish these objectives and to help meet the goals which President Bush has established.

The Nation has short-term and long-term milestones and objectives for our transportation system, and the agenda for achieving them must be phased accordingly. With the issuance of the National Transportation Policy, the Administration has taken an important step in providing guidance and leadership on the direction of transportation policy for the future. The Congress plays the key role in authorizing structural changes and providing funds for the policies and programs administered by the Department of Transportation. State and local governments and the private sector are crucial to the overall execution of sound transportation policy. The entire process is incremental and on-going.

The steps are many; the solutions diverse. The strengths of the Federal, State, and local goverments and the

Dr. Tom Larson

private sector must be brought together in a new partnership to move the Nation toward a sound and balanced transportation system, that will meet our Nation's multiple and varied needs for the future.

One Third of El Segundo Employees Say "YES" to Rail Transit

Results released from a survey of employees in the El Segundo Employment Center conducted to determine their interest in riding Light Rail Transit (LRT) to work demonstrated that of 5,100 respondents, 1,758 or 34.4% said they would commute on rail transit if the service were available today.

"This is a stunning result," stated Gene Diamand, former ESEA Board Chairman and Executive with Xerox Corporation in El Segundo. "It clearly demonstrates how critical rail transit is to solving our transportation problems in the South Bay."

The survey was conducted by the Los Angeles County Transportation Commission (LACTC) with the cooperation of ESEA and area employers. Of the 15,000 surveys distributed, about one-third were returned, a relatively high percentage for a survey of this type and another indicator of the strong interest in rail transit.

To avoid "pie in the sky" answers, survey respondents were asked to examine a map of the three lines currently under construction or design (Century-El Segundo; L.A.-Long Beach; Metro Rail Phase 1) to enable them to locate their homes and workplaces in relation to those lines. They were than asked, given their work schedules and on-the-job requirements, how they would get to work if the service were available today.

Light Rail Extension Status Report

In March, 1990 the Los Angeles County Transportation Commission voted to approve the next light rail transit projects to be built in Los Angeles County. The three lines are: the North Coast extension of the Norwalk-El Segundo line; the San Fernando east/west line; and the Pasadena-Los Angeles line. Environmental Impact Reports have been prepared on all three of these lines.

The North Coast extension is proposed to follow Aviation Boulevard north from Imperial Blvd., turning west at Century Boulevard through the Airport area via 96th Street to Westchester Parkway and Lincoln Boulevard north to Culver Boulevard. The initial phase of this extension will likely terminate at LAX Parking Lot C.

Local efforts encouraging the Commission to support the North Coast extension were substantial, including support from ESEA and the Westchester Chamber of Commerce. Toni Reina, Chairperson of the Chamber's Traffic and Transportation Committee states, "Business and community groups in and around Westchester realize the importance of the North Coast extension not only to enhance the Norwalk-El Segundo line currently under design, but as an important element in the overall management of traffic in the region." Ms. Reina goes on to stress the importance of this extension "To provide access to several planned developments in the area such as the Playa Vista project; the Northside project at LAX and Continental City."

ESEA Supports Completion of Douglas Street

Kathleen A. Meyers, Deputy Executive Director of ESEA, testified at a January 8 hearing of the California Public Utilities Commission (PUC) in support of the City of El Segundo's application for an at-grade crossing of the AT&SF tracks at Douglas Street. This crossing would complete the southern extension of Douglas Street to Rosecrans Ave. The City presented testimony from business and industry located in the area citing specific benefits which would result from the extension of Douglas Street, such as providing an alternative route for the transportation of spacecraft from the TRW Redondo Beach facility to LAX. If the Public Utilities Commission approves a grade crossing at Douglas Street the extension will not only help alleviate north/south arterial congestion but will provide greater access to the Douglas Street LRT station. In addition, a study sponsored by ESEA has shown that completion of Douglas Street will significantly enhance the effectiveness of the Aviation/Rosecrans intersection reconstruction project.

Richard Lundquist, ESEA member and President of Continental Development Corporation, notes "This project has been an important focus of ESEA members as well as the City of El Segundo. The proposed extension of Douglas Street would provide an alternative north-south artery and thus relieve a portion of the present congestion at the Aviation/Rosecrans intersection."

In an effort not to increase the number of grade crossings in the area, the Santa Fe Railroad indicated the City's request for an at-grade crossing at Douglas might be considered if another crossing in the area were closed. The City of El Segundo has offered to close the 118th Street crossing which is one of three ingress/egress points into the Northrop parking lot on Aviation. The possibility of closing 118th Street remains under discussion.

The PUC is expected to render its decision on this issue later this year.

ESEA Participates in LACTC's Art for Rail Transit Program

Five ESEA member companies are participating in the Los Angeles County Transportation Commission's Art for Rail Transit program which will commission works of art for five passenger stations in the El Segundo Employment Center on the Norwalk-El Segundo "Green Line". An Art Advisory Committee, comprised of representatives from neighborhood citizens groups, local businesses and other area interests, has been established to involve the local community in the selection and installation of art works for these stations.

See page 8

Aviation-Rosecrans *Continued from page 1*

contributions, along with financial contributions from the cities of Hawthorne, Manhattan Beach and El Segundo, comprise the local match that was required to secure $900,000 in Federal funding FY88/89 for the design and engineering of the intersection as well as the extension of Douglas Street.

ESEA Chairman and Aviation/Rosecrans project oversight committee participant, Gerald Geismar, states "The reconstruction of this intersection is vital to the economic stability of the region". Once labeled the second worse intersection in the County, Mr. Geismar goes on to state, "We are pleased the consultant is on board and the business community will assist wherever necessary to keep this project on a critical path".

The Long Beach - Los Angeles Blue line officially begins service June 14, 1990.

Municipal Area Express "MAX" Bus Service Begins in April

The new Municipal Area Express "MAX" bus service, which was designed to shuttle South Bay commuters to their jobs in the El Segundo Employment Center, began operation April 18, 1990. Formerly the CTIP progrm, MAX operates three weekday routes into the El Segundo area with busses running every 20 minutes during the morning and evening peak rush hours. The first route will travel through the South Bay beach cities; the second originates in the Palos Verdes Peninsula and the third begins in the San Pedro-Torrance area.

Each MAX bus carries 25 passengers and offers amenities such as highback reclining seats, air conditioning, overhead luggage racks and reading lights. For $1.50 per ride, or $54.00 for an unlimited monthly pass, riders can relax and enjoy the daily commute in an atmosphere of comfort.

Jacki Bacharach, MAX Chairwoman and member of the Rancho Palos Verdes City Council is enthusiastic about the significance of the MAX Program. "One of the most important things about MAX," she states, "is that it brings all the cities and the private sector together to solve a regional transportation problem".

The MAX bus service is sponsored by a coalition of South Bay jurisdictions including: El Segundo, Hermosa Beach, Lawndale, Los Angeles, Manhattan Beach, Rancho Palos Verdes, Redondo Beach, Rolling Hills Estates, Torrance, and Los Angeles County, with Torrance serving as the administrator. The project is funded by these jurisdictions in partnership with the Urban Mass Transportation Administration, the Los Angeles County Transportation Commission, and the Southern California Association of Governments.

Hermosa Beach City Council Votes to Retain Parking on Pacific Coast Highway

In spite of a majority approval from the City Planning Commission in November to remove parking on the west side of Pacific Coast Highway (PCH) during p.m. peak hours, the Hermosa Beach City Council voted at their January meeting not to include the parking ban as part of the revised circulation element of the City's general plan.

The Hermosa Beach Chamber of Commerce opposed the parking ban claiming a revenue loss to those businesses who rely on on-street parking would be significant. Business owners located on the west side of PCH stated the increase in traffic volume resulting from the parking ban would create a hardship on their operations. The City Council expressed concern over the possible increase in parking on residential streets, and called for El Segundo aerospace companies to start a transportation system and work harder at persuading their employees to rideshare.

Hermosa Beach residents, and some business owners, concerned with the volume of commuter traffic using residential streets, support the parking ban as a way to alleviate congestion on PCH and help deter commuters from using alternative residential routes.

The City of Hermosa Beach's longstanding policy of allowing on-street parking on PCH during the p.m. peak continues to act as a major impediment to the flow of southbound commuter traffic. Traveling on 3 lanes through Westchester, El Segundo and Manhattan Beach, commuters are forced to merge to 2 lanes in Hermosa Beach.

MAX REGIONAL ROUTE MAP

SCAG Develops Regional Employer Fare Subsidy Program

The Southern California Association of Governments (SCAG) has developed a Regional Employer Fare Subsidy Program to create a transit voucher that employers can buy and disseminate to employees as a form of subsidizing transit costs.

The program, modeled after one in the New York City area, is designed to allow greater flexibility in subsidizing employee transit expenses by providing a voucher that can be accepted by any transit carrier in the region. The voucher will be produced for sale to employers, who will in turn distribute the vouchers to their employees. The employees then have the opportunity to decide for themselves which operator is best for them based on individual transportation requirements.

Phase One of the program has been completed by SCAG staff and the program's working group. The working group includes regional and local transit operators, county transportation commissions, and several other public and private entities. Phase Two will include implementing an 18-month demonstration project, while Phase Three will focus on program review and analysis.

The program is envisioned to be partially funded through an UMTA Section 8 grant covering implementation, administrative, marketing and analytic expenses. Additional costs will be paid through revenues generated by the program, which are expected to lead to a self-sustaining program.

The program requires four players: the employer; employees; the transit operator; and the program manager or vendor. The vendor produces a voucher worth the subsidy amount (expected to be $15 due to tax regulations). The voucher is then sold to the employer, who in turn distributes it to the employee. The employee takes the voucher to the operator and applies it toward the purchase of some type of transit pass, coupon book, or tokens. The operator returns the voucher to the vendor in exchange for a full refund of the voucher amount.

The advantage for employers is that they need only work with one entity to provide a transit subsidy good on many different transit systems using diverse fare structures and forms of payment. Transit operators benefit by reaching a broad range of employers while maintaining their own fare program. Commuters benefit by receiving a subsidy for the transit option of their choice.

Ticket to Ride(share) at TRW: Southern California Program Aims for Smogless Skies

The San Diego Freeway is jammed tighter than a free Bruce Springsteen concert. The dirt-brown blanket of smog over Los Angeles stings in your bloodshot eyes, and as you crawl along too fast for first gear and too slow for second, you notice a commanding similarity among the surrounding sea of automobiles: the vast majority have but one occupant.

Regulation XV aims to drastically alter this picture. The South Coast Air Quality Management District (SCAQMD), armed with the responsibility to enforce the legislation, is getting tough. That means TRW and other employers are required to help solve, or at least drastically reduce, Southern California's chronic air quality problem.

On November 29, 1988, S&D submitted a plan outlining means to reduce the number of cars that take TRW employees to and from Space Park each day. Other TRW locations that fall under SCAQMD's jurisdiction (Ballistic Missiles Division, Capistrano Test Site, Domin- guez Hills, etc.) followed suit in 1989. The mandate is to increase TRW's average vehicle ridership (AVR) from about 1.1 riders per vehicle to 1.5 for Space Park, that means a minimum of 3,750 fewer automobiles daily.

"Some companies with longtime ridesharing involvement have AVRs of 1.25, so for TRW to jump from 1.1 to 1.5 is a pretty tall order," says S&D's newly hired ridesharing expert Craig Rogers, Supervisor of Transportation Services. "When people think of ridesharing, they usually think of the negatives. The challenge is to make it more convenient than driving solo."

And challenge it is; failure to develop an acceptable plan can result in a possible fine of $25,000 for each day of non-compliance.

"Regulation XV is a dramatic way to say the good old days are gone and that we must do something before we choke on our indulgence in the automobile," says Red Baisden, Director of Procurement and Material Services who is charged with the responsibility to implement Space Park's ridesharing plan.

Just what will Regulation XV mean for TRW's Southern California employees? "Effective ridesharing results in time and money saved and a more enjoyable commute to and from work," maintains Bill Wells, Manager of Transportation and Traffic. "But these gains come with some pains—healing a mental addiction to the automobile and overcoming a sense of losing privacy, for example." Both pains can be cured on a voluntary basis according to Wells, and the Company will create incentives to attract employees to ridesharing in vans or cars and other alternatives to solo commuting. The details aren't final, but potential means to attain the 1.5 AVR goal include company-subsidized van pools, preferred parking for carlvan pools, computerized ride sharing match services and noontime shuttle services. But there's also a more difficult barrier — the powerful role the automobile plays in Southern California culture, where you are what you drive and where the automobile provides a certain sanctuary.

"These are all legitimate concerns," says Wells, "and we'll devise ways to address them, such as improved transportation between buildings, a lunchtime shuttle to local malls or restaurants and the availability of a ride home in an emergency."

Regulation XV is destined to make "ridesharing" a household word in Southern California. And it won't just be affecting big corporations like TRW — companies employing as few as 100 people at a single work site will eventually be required to develop transportation plans.

Though the prospect of relinquishing the privacy of their own automobiles may be a dark cloud hanging over car-conscious Southern Californians, perhaps the potentil for Regulation XV to clear the air and the freeways means that cloud has a silver — instead of brown — lining.

California Voters Approve Proposition 111 A Spending Limit for the 1990s

On June 5, 1990, California voters approved Proposition 111 The Traffic Congestion Relief and Spending Limitations Act and Proposition 108 The Passenger Rail and Clean Air Bond Act. What is Proposition 111? It is probably the most significant fiscal policy achievement to emerge from the Legislature in decades. It directly and responsibly addresses vital State needs in the most expedient way possible.

Prop. 111, originally Senate Constitutional Amendment 1, authored by Senator John Garamendi and passed by the Legislature June 30, 1989, was the culmination of months of negotiations led by a coalition inspired by Cal-Tax to solve serious problems plaguing State fiscal policy. "These problems are so great as to threaten the delivery of essential State and local government services, and endanger the State's current and future economic health." Larry McCarthy, President of Cal-Tax states "This package represents an important investment in a comprehensive transportation program that will produce higher productivity and a smoother flow of everything traveling on our State highways."

An $18.5 billion plan... Prop. 111 is a comprehensive effort to address California's mounting transportation crisis. In conjunction with Prop. 108, $18.5 billion will be raised over the next ten years in the following way:

- A five-cent per gallon increase in the gasoline and diesel user tax effective August 1, 1990 and additional annual one-cent per gallon increases until the total reaches nine cents - $12.9 billion.
- Increased sales tax on the sale of gasoline and diesel fuel due to the increase in the gasoline and diesel user tax. - $600 million.
- A 55% weight fee increase for trucks over 4,000 pounds starting August 1, 1990 and a 10% increase on January 1, 1995. - $2.0 billion.
- General obligation bonds to raise funding for passenger rail transportation, $1 billion approved by voters on the June 1990 ballot, $1 billion on the November 1992 ballot, and $1 billion on the November 1994 ballot. - $3.0 billion.

Prop. 111 will adjust the State spending limit to accommodate the higher gas tax and truck weight fees. Prop. 111 will also let increased sales tax revenues attributable to a gas tax increase be spent on transportation. "These measures will work to reduce traffic congestion and ensure cleaner air" notes Mr. McCarthy, "drivers on California highways now spend 300,000 to 400,000 hours a day in grid-lock with cars operating inefficiently under these conditions and causing pollution."

Gerald G. Geismar
ESEA Chairman
1990

Transportation Needs ....

- California's current transportation spending program (State Transportation Improvement Program, or STIP) is underfunded by an estimated $4 billion.
- The State may be unable to match available Federal transportation dollars.
- California rates last among all States in per-capita spending on transportation - even behind the District of Columbia.

New Programs... Prop. 111 creates a new funding category, called flexible congestion relief. Any capacity enhancement project designed to reduce or eliminate traffic congestion, including local road and mass transit guideway improvements, will qualify for funding... An interregional road system, with defined routes, will be prepared by the Department of Transportation, for completion within 10 years. $1.25 billion in high priority projects will be funded and included in the STIP." A state-local demonstration program that was created by SB 140 in 1988 will become permanent and funded annually. Cities and counties will receive 11.5% each of the new fuel tax revenues. Distribution of these revenues to cities will follow current law, based on population. County funds will be apportioned based on a formula that allows the state controller to compute two different apportionments and select the highest for each county. "Propositions 111 and 108 are critically important to California's economic and environmental future," states Mr. McCarthy.

ESEA Employers Form Commuter Discount Task Force

The City of Redondo Beach, Xerox Corporation, TRW Inc., The Aerospace Corporation and a number of other employers have formed a task force to jointly develop a regional Commuter Discount "pilot" program. Commuters of all participating Reg XV employers will receive a discount card which will enable them to receive various discounts on food, merchandise, and services offered by the businesses that elect to support program efforts to reduce vehicle miles traveled. The task force is confident that the participating businesses, as well as employers and card holders, will benefit from the implementation of this program. For more information call Cara Rice at (213) 373-1171 x 2275.

TIPS...On The Road

(Reprinted courtesy of the South Coast Air Quality Management District (SCAQMD). If you would like to know more about any of these tips to clean the air, please contact them at the AQMD, 9150 Flair Dr., El Monte, CA 91731, (818-573-6283)

RIDESHARE - you can cut down on the pollution coming from motor vehicles by sharing a ride. Carpooling or vanpooling also strike at another woe: freeway congestion. LEAVE THE DRIVING TO THEM - use public transportation. The bus reduces car repairs and commuting costs, along with stress. For bus schedules, call 213/626-4455 in LA County; 714/636-7433 in Orange County; 714/682-1234 in Riverside County; and 714/825-8341 in San Bernardino County. RIDE A BICYCLE OR WALK - cycling and walking are great for short trips. Human power produces no emissions and the excercise has benefits of its own. COMBINE ERRANDS INTO ONE TRIP - instead of hopping in the car whenever you need something, set aside time to plan your errands. Cluster as many as possible. And, when you're out doing those errands, walk into, don't drive through, banks, cleaners and fast food restaurants. Vehicle idling produces large amounts of carbon monoxide and other pollutants. Drive-through lanes may be tempting, but they're also serious smog factories. MAKE SURE YOUR CAR'S AIR CONDITIONER IS WORKING PROPERLY - leaky air conditioning in cars is the single greatest source of chlorofluorocarbons (CFCs), another greenhouse gas. Check your auto air conditioner to make sure it's leakproof and, if it needs to be recharged, have its CFCs recycled. Ask your mechanic if he has a system for recycling freon. PREVENT GAS SPILLAGE. NEVER TOP OFF YOUR TANK - topping off fills your tank with gas and the air with contaminants. Remember, gasoline is another source of smog since it contains pollutants such as benzene. KEEP YOUR CAR ENGINE WELL-TUNED - dirty carburetors, clogged air filters, worn points and plugs not only waste gas and lower engine performance, they cause increased emissions of particulate matter and nitrogen oxides (NOx), two of our most persistent smog problems. DRIVE ON RADIAL TIRES - radial tires produce less air-damaging particulate matter per mile traveled than bias-ply tires do. Properly inflated tires can save up to 10% of your fuel consumption. COOPERATE WITH THE STATE'S SMOG-CHECK PROGRAM - by obtaining a smog check on your car and making any necessary repairs, you'll be helping a statewide program to reduce emissions. Remember that removing a catalytic converter or other smog control equipment is illegal. REPORT SMOKING VEHICLES BY CALLING. 1-800-CUT-SMOG - you can call our toll free number to report cars, buses and trucks that emit visible smoke exhaust for more than 10 seconds. Drivers are advised in writing to make repairs. We get about 8,000 reports each month. So, if you see a smoking vehicle, we're ready to take your call.

Art Program *Continued from page 3*

ESEA members participating on the Advisory Committee include: TRW Inc.; Northrop Corporation; Kilroy Industries; Hughes Aircraft Company; and Xerox Corporation. "This is an important program for us to be involved in," notes ESEA's Executive Director, Don Camph, "as the voice of the local community, the Advisory Committee will be able to create an individual identity at each station by utilizing visual enhancement to depict community identification and pride."

The Green Line will traverse the length of the Century Freeway and wind through the El Segundo Employment Center terminating at Compton Blvd. near TRW's Space Park complex. It is scheduled to begin operation in 1984.

March 1990

Message from the Chairman of the Board:

Enormous challenges face the residents of the Los Angeles basin in the 90's, and transportation and air quality issues are at the forefront.

The South Bay business community will have to provide a strong private sector leadership role in addressing these issues. ESEA, as the representative of a significant number of employers in this region, will continue to provide leadership in cooperation with local government and community leaders to assure that such issues are aggressively addressed and resolved for the overall benefit of the area's employers, employees and citizens.

Sincerely,

Gerald G. Geismar
Chairman of the Board,
El Segundo Employers Association

Vice President and General Manager
TRW General Services Division

esea

March 1990

TO OUR FRIENDS AND ASSOCIATES:

In the very near future Congress will act to reauthorize the Federal highway and mass transit programs. ESEA looks forward to working cooperatively with our local elected officials and members of Congress in this watershed opportunity to negotiate a new transportation partnership with Federal, State and local governments and the private sector. As this process begins, we must recognize the framework for this partnership has changed, and that issues such as clean air, balanced land use and quality of urban life have taken on new importance. Our approach to solving our transportation problems must change to reflect and embrace this new reality.

As we enter a new decade and prepare for the 21st Century, the business community in Los Angeles must be committed to maintaining and enhancing its role in solving this region's transportation problems. Our quality of life and economic vitality depend on an effective transportation system which serves all Angelenos.

We need to anticipate and respond to the transportation challenges and new realities we face. We must focus on moving people and goods, not just vehicles. We must focus on performance and productivity, not just spending. We must encourage flexible and innovative approaches to planning, funding and decision-making and not be complacent with "business as usual." We must be aggressive in developing and deploying new transportation technologies. We must be continually mindful of transportation's role in global economic competition.

Finally, we need to remember that it is the quality of our lives and our environment that our transportation system must serve and support. Our transportation system does not function in a vacuum: it must be responsive to the complex and deeply-held societal values which comprise the very fabric of our lives and well-being.

I invite our friends and partners everywhere to join with ESEA in meeting this challenge.

Sincerely,

Donald H. Camph
Executive Director
El Segundo Employers Association

esea

El Segundo Employers Association

What is ESEA and why was it started?

Located in El Segundo, California, just south of Los Angeles International Airport, ESEA is a non-profit coalition of employers and commercial property owners seeking joint solutions to their companies' — and the community's — transportation needs.

Founded in 1981 as a 501(c)(4) non-profit, mutual benefit corporation, ESEA evolved out of a growing concern among the area's employers that rapidly increasing employment in the area could lead to traffic congestion and adverse impacts on the El Segundo area as a place to live and conduct business.

Reflecting their desire for a cooperative solution to emerging transportation problems and needs, and realizing that solving them was beyond the capabilities of any single company, several major employers and developers voluntarily joined together to form ESEA.

The El Segundo Employment Center is a major aerospace, defense and electronics complex that encompasses parts of four South Bay Cities: El Segundo, Hawthorne, Manhattan Beach and Redondo Beach. ESEA members include (among others):

Chevron U.S.A.
Computer Sciences Corporation
Continental Development Corporation
Hughes Aircraft Company
Kilroy Industries
Northrop Corporation
Pacific Corporate Towers
Rockwell International
TRW Inc.
Wyle Laboratories
Xerox Corporation

In the early years, ESEA and its members concentrated on establishing effective *transportation demand management* programs. Today, these ridesharing and alternative work schedule programs remain an integral part of the overall transportation strategy for the area.

By the late 1980's, with members representing nearly 75,000 employees, ESEA's focus had expanded to include proactive strategies designed to head off potentially greater transportation problems in the future.

Expanded Function for the 1990's

Today, ESEA acts as a bridge between employers, commercial property owners, local cities, and all levels of government to help respond to the challenge of growth and its effects upon the region's transportation systems.

ESEA is the business community's voice when it comes to advocating specific transportation solutions and facilitating government legislation and regulations for effective transportation decision-making. As such, ESEA serves as the forum for the evolving public/private partnerships on transportation issues and their solutions.

ESEA Philosophy

ESEA takes a multi-modal approach as it seeks to enhance the efficiency and effectiveness of transportation systems in the area.

ESEA works cooperatively with local and regional government and elected representatives in Sacramento and Washington, D.C. to build a balanced transportation system so as to guarantee a continued high level of mobility in and around the South Bay/El Segundo/LAX region.

ESEA takes a balanced approach to solving transportation problems. In order to ease congestion and smooth the traffic flow in the short run, ESEA members practice *demand management*, thereby reducing the number of vehicles seeking to use the existing transportation system. For the longer term, ESEA seeks approval and funding for projects that will provide *capacity enhancements* to the system.

ESEA Activities

Board of Directors: ESEA's activities are governed by a 12-member Board of Directors, which meets monthly to discuss topics of current interest. In addition, the Board:

- Sets association policy;
- Adopts an annual work program and budget;
- Maps strategy;
- Takes positions on legislation;
- Reviews progress toward accomplishment of the annual work program objectives.

Competition for Project Approval and Transportation Grants: ESEA represents the transportation interests of the El Segundo Employment Center to outside agencies. Through ESEA, local jurisdictions are in a better postition to compete for project funding from federal, state and regional sources.

Liaison to Government Agencies: ESEA represents members' interests in regulatory, legislative and transportation planning issues at all levels of government.

■ **Transportation Studies:** ESEA sponsors transportation studies to support specific project objectives; for example, studies to quantify the costs and benefits of reconstructing a particular intersection, adding a station to the light rail line, and widening a major arterial in the area.

■ **Transportation Systems Management Plans:** ESEA members have developed transportation systems management (TSM) plans that increase mobility for their employees. Member companies are aggressively implementing these plans for ridesharing, staggered work hours, etc.—all in compliance with the South Coast Air Quality Management District's Regulation XV—resulting not only in more mobility, but also cleaner air.

■ **Ad Hoc Task Forces:** ESEA forms *ad hoc groups* to focus on specific issues that are of significant interest to members. These task forces often include representatives from local cities and other interested organizations.

■ **"Quick Response" to Problems:** ESEA acts to expediently bring specific issues or problems to the attention of appropriate public agencies, and then provides the necessary follow-through to resolve them in an effective and timely manner.

■ **Newsletter:** An ESEA newsletter is published twice a year to keep members informed on new developments and provide timely information on issues.

ESEA Budget and Dues

■ **Budget:** ESEA's annual budget is approximately $160,000.

■ **Dues Structure:** Although there is no membership fee to join ESEA, member employers contribute $2 per employee per year, and commercial property owners contribute $2 per 200 square feet of leasable area per year.

■ **Funding of Association Activities:** ESEA's staff and administrative expenses are entirely underwritten by member contributions, without subsidy from public sources. On an as-needed basis, members may contribute additional funds for special projects of particular interest to them.

Specific ESEA Accomplishments

The following are some of ESEA's major accomplishments:

■ **1984** Responding to an ESEA-led advocacy effort, the Los Angeles County Transportation Commission (LACTC) decided to build a light rail line in the median of the Century Freeway.

In addition, the California Transportation Commission (CTC) allocated $3.4 million in state highway funds to widen Sepulveda Boulevard in El Segundo. These funds were also used to add left-and right-turn lanes at major intersections.

1985 The CTC allocated over $10 million in federal highway funds to add a lane to the South Bay curve of the San Diego Freeway. Approval of the project came after a joint request from ESEA members to the governor that stressed the need for improved transportation to respond to the continuing expansion of the El Segundo Employment Center.

1986 Caltrans agreed to redesign the Douglas Street on-ramp to the Century Freeway in response to ESEA concerns about traffic circulation in the area. ESEA sponsored a technical study that resulted in a new ramp design and a revision to the city's local circulation plan.

The state legislature re-enacted ride-sharing tax credit legislation (SB 1794) authored at the request of ESEA by Senator Robert Beverly, representing El Segundo and the South Bay.

After a broad-based advocacy effort led by ESEA, $150 million in funding was approved for construction of the El Segundo Extension of the Century Freeway Light Rail Transit Project. Los Angeles Supervisior Deane Dana played an important leadership role in securing approval.

Congressman Glenn Anderson, in response to a request from ESEA, secured $2.4 million in federal funds (requiring $600,000 in local matching funds) to examine the feasibility of expanding the Sepulveda Boulevard tunnel under the Los Angeles International Airport.

1987 Local jurisdictions lined up in support of the Sepulveda Tunnel (at LAX) traffic study. In a formula proposed by ESEA, the $600,000 local matching funds agreement involved contributions from the L.A. Department of Airports, the County of Los Angeles, and five South Bay Cities.

1988 The LACTC voted to make the Century/El Segundo Light Rail Line the first fully automated, driverless light rail system in the United States.

At the urging of Congressman Mel Levine, Congress approved $900,000 in funding for ESEA's proposed program for re-construction and widening of the the intersection of Aviation Boulevard and Rosecrans Avenue.

1989 The LACTC approved the Aviation/Rosecrans project for Regional Federal Aid to Urban Systems (FAUS) funding. The City of Hawthorne was named lead agency and the project implementation process began.

Following an intensive five-month lobbying effort led by ESEA, the LACTC rejected a proposal by its staff which would have severely compromised essential features of the Century/El Segundo Light Rail Line.

2186

TRW

commuter services information package

commuter services

Commuter Services

Eager to enjoy a relaxing commute to and from work? Care to cut commuting costs? Like to leave the driving to someone else? Isn't it about time you checked into commuting alternatives?

This packet contains much of the information you need to choose the commuting alternatives that are right for you. And, if you contact your Commuter Services coordinator, he will provide more details about the following alternatives, programs, and incentives:

- Carpools
- Public transit
- Preferential parking
- Vanpools
- Park-and-ride lots
- Interfacility shuttle bus service
- Bicycling

guaranteed ride home

Guaranteed Ride Home Program

TRW's Guaranteed Ride Home Program provides registered rideshare program participants (only) transportation in the event of an emergency. For example, the program enables a parent to pick–up sick children from school and take them home, or enables participants to get home if the driver must leave in an emergency. (Missing a ride or overtime is not a bona fide emergency.) The service is provided through a local taxi agency at no cost (up to four times a year) to registered rideshare participants only. The participant must reimburse TRW for taxi use should the four time use limit be exceeded.

How To Use Guaranteed Ride Home

When registered rideshare participants encounter situations requiring emergency transportation they must:

1. Call the Commuter Services Office at Ext. 34431 and provide name, TRW badge number, and the TRW building where the pick–up is to take place. (Participants must be in the lobby when the taxi arrives.) Commuter Services will verify participation and have the taxi dispatched. The taxi driver will ask the passenger to identify him/herself and take down the name and badge number.

2. If, for some reason, Commuter Service cannot be reached, call Ext. 25825, the Chauffeur/Courier Dispatcher and provide the same information as in #1 above. If the request is routed through the dispatcher, the participant's supervisor must certify that the caller is a registered participant and provide his/her name and badge number.

poolmatch

In–House Rideshare Matching

TRW Rideshare Matching List Registration

To assist employees wishing to carpool, vanpool, or take public transit, and to comply with the Air Quality Management District's Regulation XV requirements, TRW has established its own in–house, rideshare matching program: "Poolmatch."

Poolmatch is an on–line data processing system that provides personalized matching for employees interested in getting information on carpooling, vanpooling, and bus transit from within TRW.

At orientation you are requested to provide such information as your home location, work hours, work extension, and present method of commuting to work. All information is strictly confidential and used only for ridesharing purposes.

From the information provided, "Poolmatch" develops a Ridesharing Match List of neighboring co–workers with whom you may rideshare either on a regular basis, or on smog alert days, personal emergencies, fuel shortages, etc.

savings

How much do you spend commuting to work? Next to food and housing, the largest percentage of your annual income is spent on your automobile.

But this story could have a happy ending. Sit down and figure out how much money you now spend commuting to work. Then, using our formula, calculate how much you would save by ridesharing. Your answer just may surprise you.

Fixed Costs

Insurance – Add the premium of all policies directly related to car operation: property damage and liability, comprehensive and collision.

License, Registration Fees, and Taxes – These are usually once–a–year costs added to your total fixed costs. Sales or excise taxes paid when the car is bought are part of the purchase price and should not be included.

Depreciation – Basically, this is the difference between what you paid for your car and what you sell it for. To arrive at your annual depreciation expense, subtract the trade–in value of your car from the purchase price and divide by the number of years you plan to keep the car.

Finance Charge – If you finance the purchase of your car, the annual interest charges should be included in the fixed costs.

Want To Figure Out What You Can Really Save? No Problem. Start Here.

Your costs of driving alone to work:

1. Mileage–related operating costs for your vehicle–gasoline (price per gallon divided by miles per gallon) plus cost of oil, tires, maintenance, and repairs (use 5.95 cents per mile for subcompacts; 8.04 cents per mile for compact; 8.86 cents per mile for standard) _____Cts/Mi.
2. Annual mileage to work _____Mi.
3. Annual mileage–related operating costs (line 1 x line 2) $_____
4. Annual parking costs $_____
5. Annual operating costs (line 3 + line 4) $_____
6. Annual ownership cost – for all travel (See Fixed Costs above as a guide for your calculations)
   a. Depreciation $_____
   b. Insurance $_____
   c. Taxes $_____
   d. Fees $_____
   e. Finance Charge $_____
   f. Total for annual ownership cost $_____
7. Annual over–all mileage _____Mi.
8. Percent of ownership cost allocated to the work trip (line 2 ÷ by line 7) _____%
9. Annual ownership cost for work trip (line 6f x line 8) _____
10. Total cost for driving to work alone (line 5 + line 9) $_____

For A Shared Driving Carpool:

11. Total annual operating cost for the work trip (line 5 ÷ by number of people in carpool) $_____
12. Annual ownership cost (from line 6f) $_____
13. Annual work trip mileage for vehicle in a shared driving pool (line 2 ÷ by number of people in carpool) _____Mi.
14. Percent of ownership costs allocated to the work trip for a shared driving carpool (line 13 ÷ by line 7) _____%
15. Annual ownership cost allocated to the work trip for each person in a shared–driving pool (line 12 x line 14) $_____
16. Total cost for commuting to work in a shared–driving carpool (line 11 + line 15) $_____

bus

Bus Services

Public transit lines and private commuter buses are readily available as commuting alternatives for TRW employees. These buses provide a convenient and economical means of commuting.

Public and Private Transit
The **Southern California Rapid Transit District (RTD)** has more than 200 bus routes which provide safe and convenient transportation in the Los Angeles region. Many of its lines directly serve the TRW Greater Space Park sites.

In addition, a number of Municipal bus lines intersect RTD routes providing a comprehensive bus network.

Examples are:

- South Bay Transit (Torrance, Gardena, Carson)
- The Wave (Hermosa and Redondo Beach)
- The Lawndale Trolley

C–Tip (Commuter Transportation Implementation Plan) is being created to assist South Bay residents in getting to and from work. Nine South Bay cities are involved in this cooperative effort. Initial bus service is expected in the Winter of 1990.

The **Antelope Valley Bus Company** serving Palmdale and the Valley, operates a coach equipped with air conditioning, reading lights, and reclining seats.

Transit schedules, maps, and brochures are available from your Commuter Services Coordinator.

bus

Bus Services

Public transit lines and private commuter buses are readily available as commuting alternatives for TRW employees. These buses provide a convenient and economical means of commuting.

Public and Private Transit
The **Southern California Rapid Transit District (RTD)** has more than 200 bus routes which provide safe and convenient transportation in the Los Angeles region. Many of its lines directly serve the TRW Greater Space Park sites.

In addition, a number of Municipal bus lines intersect RTD routes providing a comprehensive bus network.

Examples are:

- South Bay Transit (Torrance, Gardena, Carson)
- The Wave (Hermosa and Redondo Beach)
- The Lawndale Trolley

C–Tip (Commuter Transportation Implementation Plan) is being created to assist South Bay residents in getting to and from work. Nine South Bay cities are involved in this cooperative effort. Initial bus service is expected in the Winter of 1990.

The **Antelope Valley Bus Company** serving Palmdale and the Valley, operates a coach equipped with air conditioning, reading lights, and reclining seats.

Transit schedules, maps, and brochures are available from your Commuter Services Coordinator.

van

Vanpooling

Let Us Give You A Lift

Traveling to and from work can be a demanding and a frustrating part of your day. TRW's Vanpool Program provides a commuting alternative that offers significant benefits to you, the Company, and the community.

A Quick Look At Vanpooling

The program offers you the opportunity to commute in a Company–sponsored van that is economical, reliable, and more fun than driving alone. Each morning passengers board a van that drops them off at their work location. At night, they are returned to their pick–up point.

Pooling Your Resources

Vanpool groups and routes will be established wherever enough interested employees live in an area convenient for pick–up and drop–off. The driver/coordinator will be a Company–approved employee interested in assuming driver responsibilities. In addition, each pool will need one or more passengers to serve as back–up drivers.

The Commuter Services Office will provide interested driver/coordinators with names and extensions to help organize vanpool groups. Once the driver/coordinator has a sufficient number of prospective passengers, a van will be assigned based on availability. Van poolers will then be invited to a brief meeting to get acquainted with each other and the vanpool administrator, and to discuss the best possible route.

It Makes Sense. . .As Well As Dollars

The employees will lease the van and pay for the program's organization and administration. Passengers split the monthly commuting costs, which consist of fixed costs – depreciation, license, and insurance – and operating costs – gas, oil, and maintenance.

The cost sharing results in direct out–of–pocket savings as well as considerable indirect savings in personal vehicle insurance. It also eliminates the need for an extra family car.

According to the nation's largest car rental company, the cost of operating an average car is 50.2 cents per mile. Compact automobiles cost 47.64 cents per mile to run. Intermediate cars cost 52.8 cents per mile. And full–sized cars cost 63 cents per mile.

See how much money you can save by leaving your car at home and taking a TRW van.

We Need Driver Coordinators

Each vanpool will need a driver/coordinator. Those who are approved by the Company will receive a free ride to and from work each day, as well as a free unlimited mileage allowance each month for personal use.

Sound Interesting?

If you are interested in participating in the vanpool program, complete the attached form and mail it to your Commuter Services Office. You will be notified if there is a vanpool that can accommodate you. If none is available, your name will be put on a waiting list.

Vanpool Interest Form

I am interested in ridesharing the vanpool as a:

☐ Driver ☐ Back–up Driver ☐ Passenger

Name _____

Address _____

City _____ Zip _____

Nearest Major Cross Streets _____

Badge Number _____

Phone (Work) _____ Phone (Home) _____

Bldg/Mail Station _____

Time Start Work _____

Time Leave Work _____

To Be A Driver/Coordinator, You Will Need To. . .

- Hold a current driver's license and have a good driving record
- Pass a California Department of Transportation physical examination and successfully complete a Company–sponsored defensive driving course
- Pick up and drop off passengers promptly each day
- Maintain the minimum number of passengers in the pool, with the assistance of the Commuter Services Office
- Arrange for fueling, washing, and servicing of the van
- Furnish a safe place for the van at home
- Provide monthly reports for operating expenses, and income

What We'll Do For You

- Help employees lease passenger vans equipped with air conditioning, AM/FM stereo, and front and rear speakers
- Assign approved driver/coordinators and back–up drivers
- Assist in organizing interested employees who live in the same area
- Help provide passengers to replace vanpool "drop–outs"
- Establish vanpool fares based on fixed and operating costs of the van
- Offer reserved, preferential van parking

It's Beneficial To Everyone. . .

Vanpooling gives a lift to the employee by providing safe and efficient transportation and lowering commuting costs.

The Company benefits by broadening its labor market, reducing the need for parking facilities, and increasing employee productivity.

And since the program helps reduce energy consumption, air pollution, and traffic congestion, it's good for the community as well.

auto

Carpooling

A carpool consists of several people driving to and from work in one automobile. Actually, carpooling is easier, friendlier, and a lot more relaxing than driving alone. In fact, carpooling is a good arrangement whether you commute 5 or 150 miles, or carpool only two to three days a week. For every person carpooling, there's one less car on the road consuming gas, producing smog, and congesting the streets, freeways, and parking lots.

One of the benefits of carpooling at TRW is preferential parking. Check with the Commuter Services Coordinator for details and registration.

Park–and–Ride lots and freeway commuter lanes are another carpooling advantage. If you would like a list of park–and–ride and commuter lane facilities in the Greater Los Angeles area, simply contact the Commuter Services Coordinator.

To start a carpool quickly and easily, contact your Commuter Services Coordinator for a personalized match list of people who live and work in your area. If you know another TRW employee with whom you can carpool, fill out and send in the attached form. When you contact potential carpoolers, you'll want to discuss the following carpoolers' do's and dont's.

The daily drive to work and back with the same poolmates works to your benefit. That's its purpose. It should be as pleasant an experience as can be made possible.

To make it so, nothing beats straight talk. Over time, some people may find that riding together can get on one's nerves. Generally, this happens because the habits or mannerisms one person may seem annoying. Often a problem can blow itself out of proportion simply because the carpoolers involved are hesitant to talk about it.

The best time to discuss potential problems is before they happen. A friendly discussion on the subject of courtesies and procedures — before the wheel turns — will do wonders.

Get together. Discuss "the Rules of the Road." What to do about the bore, the conversation monopoilzer, the snoozer, the muncher, the chain smoker, the rock fan, and other irritants that can break up a carpool faster than it came together.

The Rules of the Road come straight from experience. Read them and you're miles ahead.

Carpool Do's And Dont's

1. **Likes and Dislikes** – This is mostly a matter of courtesy. You like the news, but the others prefer soft music on the way to work. How much is too much conversation? What do you do about the fellow who uses the commute to catch up on his sleep (and snores)? Or the guy to your left who feels it's his duty to coordinate all conversation? The chain smoker amongst non–smokers? These are questions you will want to settle in the beginning. Once done and in agreement, you can expect smooth riding.

2. **Communication** – It's mainly a point of coming to an agreement. Establish a chain of communications among pool members so that adjustments can be made at a moment's notice. If illness or other problems occur, have an alternative plan. If the driver can't make it, he should call the first passenger on his route and ask him to drive. If a rider changes his plans, he should notify the carpooler who is picked up immediately before him. This is a simple procedure to follow once the sequence of pick- ups is established. Carpoolers should also appoint one of the group carpool captain — the person responsible for maintaining communications.

3. **Who Drives** – Agree upon who will drive and when. Generally, it works best to alternate drivers weekly or monthly to avoid confusion. Even driving daily works well if arrangements are made on a pre–arranged schedule. Some carpools have found it easier and more dependable to have one permanent driver with whom they share the cost.

4. **Agree on Cost Sharing** – Make arrangements in advance on reimbursement for driving expenses and set regular payment dates. To determine what a non–driver pays, it usually works best to calculate the number of miles driven in a day multiplied by the driver's cost–per–mile, divided by the daily total of the number of occupants of the car.

5. **Establish Meeting Places** – Pick the place where members will be picked up to leave for work. Decide whether to drive to a common spot or be picked up at home, then set the time and place where carpoolers can meet for the drive home.

6. **Determine Route and Schedule** – Once you have chosen the most efficient route and schedule that allows for the occasional traffic tie–up, or a late member, stick to it.

(continued on back)

Send To: Commuter Services
108A/1481

7. **Replacing a Member** – Expect an occasional adjustment. People move or change jobs often. Your TRW Commuter Services Coordinator can help you find more riders, or you can re-apply for an updated ridesharing matchlist.

8. **Avoid Side Trips** – One of the easiest traps to fall into is "Oh, would you mind stopping at the market?" or, "Can we stop? I've got a prescription to pick up." Try to avoid the "shopping syndrome" and everyone will be happier. Straight to work and straight home again. Errand-running and carpooling do not mix.

9. **A Clean, Safe Car** – Make policy and stick to it. The car that carries you to and from work must be clean, safe and comfortable.

10. **Driving Safety** – No one should tolerate speeding, taking chances, or just plain negligence. Set the safety policy at the beginning and don't hesitate to straighten out a member who strays from the path.

11. **How Long to Wait** – Everyone must get to work on time. Wait one minute, perhaps two at the most, for the procrastinator. It's up to him to be ready. Don't honk. That upsets the neighbors. Wait the agreed length of time, then drive on.

12. **Plan Ahead for Car Service** – Schedule routine vehicle maintenance in advance so that alternate driver arrangements can be made for the day of the service.

13. **If at First You Don't Succeed** –If your first efforts to join a carpool don't work out, or only partially succeed, keep trying. More and more names are added regularly to the TRW Commuter Services Office matching file.

TRW Carpool Agreement

So that your carpool may use the preferred parking areas assigned to carpools only, the following procedures and requirements must be met:

1. Two (2) or more TRW employees riding to work together constitute a recognized carpool and are eligible for preferential carpool parking.

   1.1 One of the carpool members must be designated as the captain. This individual will coordinate all needs of the carpool with the Commuter Services Office.

   1.2 All carpool members must complete a carpool registration form.

   1.3 Regular members must carpool an average of four (4) days per week.

   1.4 Part-time members must carpool a minimum of one (1) prearranged day per week. Carpool permits will state effective days.

   1.5 Members may be registered in only one carpool at a time.

2. Each carpool group will be issued one permit with a current decal.

   2.1 The carpool permit is to be hung from the vehicle's windshield rearview mirror.

   2.2 If the permit is not showing, the preferential parking area may not be used. Should the permit become damaged or stolen, contact the Commuter Services Office, or the vehicle will be cited when parked in carpool parking areas.

   2.3 All carpool vehicles must also display appropriate TRW parking decals originally assigned by the Parking Office.

3. Preferential carpool parking will be provided in areas designated by the Commuter Services Office. These stalls will be properly marked.

4. Notification of changes in the carpool must be made to the Commuter Services Office as soon as possible.

   4.1 Should the carpool need a replacement rider/driver, the Commuter Services Office will refer persons from the same home/work area to the carpool captain.

   4.2 If carpool revalidations are not met on a semi-annual basis, each person in the carpool will lose carpool privileges for 6 months.

   4.3 All persons in the carpool are responsible for the carpool permit.

   4.4 Carpool permits are not to be given to or used by any person outside the assigned group.

   4.5 All carpool permits are to be returned upon termination of employment or disbandment of the carpool group.

   4.6 Failure to notify Commuter Services of additions and deletions to your carpool can result in loss of carpool privileges.

TRW Carpool Registration Form

Before signing, please read statement at the bottom of this card.

Name (Print) / Signature	Address	Bldg/MS	Work Ext	Badge No

I certify the information provided on this card is correct. I have read the carpool permit agreement for TRW. Under these requirements, I qualify to participate in the carpool. I will continue to comply with the requirements for as long as I participate in the carpool and enjoy carpool benefits.

bike

Bicycling

If you live less than 7 miles from work, try riding a bike. It's a great way to get exercise and, depending on your route and distance, it can be almost as fast as driving. Also, a bike is a lot easier to park.

Bike racks are located at various locations around the plant site. Shower facilities may also be available. Look for the location nearest your work place or check with your Commuter Services Coordinator.

Why Bike To Work?

Save Money
On a monthly basis, bicycle commuters spend 40 times less on transportation than motorists. In addition, many insurance companies offer lower rates to those who do not use a car for commuting.

Save Time
Mounting traffic congestion causes auto trip time to increase while travel time for bicyclists generally remains constant.

Improve Your Health
Cycling is excellent exercise. With continued use, it will benefit a person's cardiovascular system, improve muscle tone, as well as aid in weight loss.

Improve the Environment
Bicycles produce no adverse environmental impacts. Unlike motor vehicles, they are quiet, use no fossil fuels, and emit no pollutants.

Enjoy Your Commute
Moving under their own power gives bicyclists a sense of independence and accomplishment.

Tips For The New Commuter

Bicycling to work takes some planning:

Bicycle and Other Essential Equipment
Most bicyclists prefer a 10–speed bike, but some find a 3–speed bike sufficient. Whatever you choose, be sure your bike is adjusted to fit you and is kept in good working order.

A headlight and reflectors are legal requirements for traveling during darkness.

Saddlebags, racks, and handlebar bags are good ways to carry a change of clothing or a briefcase. **Do not carry heavy packs on your back.**

Head injuries are the most common serious injury bicyclists suffer. A helmet is a wise investment.

Riding and Repairs
Know and obey all bicycle laws.

Become thoroughly familiar with the operation of your bike before your first commute trip. Practice riding on low–traffic streets and in empty parking lots.

Learn to make simple repairs and to take care of routine bicycle maintenance.

Route Selection
It is a good idea to drive the street portions of the route first and to ride them again on a weekend.

If possible, the first day ride in with an experienced bicyclist who is familiar with the route.

Bicycle Security
Wherever you leave your bike, secure it carefully to protect against tampering, theft, and the weather.

Register your bicycle in the city/county where you live. This will help in tracking down your bicycle if it is stolen.

Clean-up and Work Clothes
For short commute trips, a quick "alcohol bath" will be sufficient to freshen you up once you arrive at work. Showers are also available to you (check with your Commuter Services Coordinator).

You can take a change of clothes on your daily bike commute or you may use the clothes storage facilities available to you at TRW (check with your Commuter Services Office).

The Open Road

CORPORATE COMMUTER SERVICES SUMMER 1990, ISSUE: 1

Welcome to the first issue of

"THE OPEN ROAD Commuter Newsletter"

Our main objective in developing this newsletter is to increase awareness of the transportation and air quality issues that plague our city. It's important that all of us become more open to alternate commute modes and believe me that's the hardest issue for you and me to deal with!

From left to right: Gordon Williams, Ed Clifford (in van), Dale Worrell, Brenda Derby, Jon Garrison, Rosena Brown, Cynthia Avery, Noemi Santos, Jim Di Bella, Supervisor Transportation, Carole Klement, Commuter Services, Don Armstrong (in van), Sara Jones, and Bob Yribe.

The open road graphic on the masthead (thanks to Art Designer, Kim Ige!) is an idea of what the quality of life in Los Angeles should be. Wouldn't it be marvelous to get to work on an uncrowded road or freeway and be able to see the mountains and skyscrapers that are the hallmark of this Southern California metropolis? We can make a difference through the commute choices we make.

We're really excited about two new programs that are being introduced to you in this issue . . . The Guaranteed Ride Home and the Transit Subsidy programs, both offered as incentives to become involved in an alternate commute mode (other than driving alone!). There is an article on carpooling, ridesharing tips, vanpool availability, registration for forming new carpools and, much more.

In future issues, we'll have a section on legislative issues that can affect all of us now and in the future. We'll talk with long-time vanpoolers and carpoolers who will share with you the many advantages of ridesharing. There will be a question and answer section where you can send us your questions and we'll get you the answers. We'll also have a section for carpool and vanpool information and availability.

So please, take a few minutes and read through our first issue . . . remember we're all in this together, and if we work together, we can make a difference and improve the quality of our lives.

Why Have a Commuter Program? One Company's Answer:

By John Lenz
AVCO Financial Services
Transportation Coordinator

(Editor's note: the following article is an abbreviated excerpt from the ACT Southern CA chapter newsletter, and is reprinted with permission of the author.)

As we move into the future of ridesharing, please remember why we are here. The Earth has had enough. This industry holds one of the master keys to the future of life as we know it on this planet. As this crisis "heats up," we will become more valuable representatives of hope. By continuing to push for change in peoples' lives we give the Earth the respect she deserves. We didn't inherit this Earth from our parents, we're borrowing it for our children.

Why are we here? Because:

• Children growing up in this (greater Los Angeles) region will only have use of 85% of their lungs.

• Every 10,000 miles a car releases its own weight in carbon into the air.

• We will have doubled the Earth's C02 by the year 2000.

• We have destroyed over 5% of the Earth's ozone layer.

• As Earth's air gets uglier, scientists find the human immune system begins to break down and becomes more susceptible to disease.

• The 6 hottest years on record were in the last 8 years.

Scientists have said a 3 degree global warming is a given. We can't turn back on that. And if we continue exactly as we are now by growing, expanding, driving, producing, and profiting more at the Earth's expense, we then are also bringing with us an 8 to 12 degree global warming. What does a 3 to 8 degree increase in temperature mean? Here is NASA's answer as supplied by the Goddard Space Institute:

• New York City will go from 4 evenings, where temperatures stay above 80 degrees, to 68.

• Dallas: the number of 100-degree days goes up from 19 to 78.

• Phoenix: heat waves approaching 130-140 degrees instead of the 120 tops

Commuter programs are more than just meeting some invisible state board of evaluators. They're a way to show a company's dedication to its employees, the community, and even on a much larger scale, its statement to support a battered environment.

Transit Subsidy Available NOW

Effective immediately, any Corporate employee who uses public transit to commute to and from work is now eligible for a maximum of $15.00 per month subsidy. All participants must sign a statement confirming that their use of the subsidy is for THEIR PERSONAL transportation to and from work.

Contact the Commuter Services office for more details.

Alert! Alert! Alert!

Vanpool riders are needed in the following areas: Long Beach, Cypress, Corona, Los Coyotes, Cerritos, 1800 Oak, and Fullerton Buena Park. Contact Commuter Services or ext. 7766.

Prepared by Carole Klement, Corporate Commuter Services, ext. 568-7766, C1/A128.

Guaranteed Ride Home

How will I get home if I have an illness or family emergency? This is the number one question asked by potential ridesharers. Corporate now has an answer to that all important question...Guaranteed Ride Home Program.

Available now, this new commuter program will guarantee a ride home to any employee who uses an alternate commute mode such as, vanpool, carpooling, biking (non-motorized), walking, and public transit. To take advantage of this new program you must be registered with the Commuter Services office and if you carpool you must also display a carpool placard. Registration Form 18250CO is now available for use.

"Emergency" is defined as illness or severe crisis for the employee or immediate family member.

This program is not designed to serve non-emergency or planned trips for such reasons as personal errands, pre-planned medical appointments, pre-arranged overtime, business related travel, working late without a request from Supervision, or injury on the job. Work injuries are handled through the Medical Department and Security. We feel this program makes ridesharing an attractive option to the drive-alone commuter.

So how about it? Why not give ridesharing a try? Contact Carole in the Commuter Services office for more details on this great new program.

TALKBACK

If you have any questions or ideas regarding ridesharing, or alternate commute modes, please feel free to call Carole Klement on extension 7766 or send your thoughts to Commuter Services C1/A128. Also, if you have any articles that you think may be of interest to our employees please pass them on and we'll publish them in our next issue.

ARE YOU READY TO TAKE THE PLUNGE!

Are you just on the verge of maybe taking that plunge into carpooling?? We're now in the process of developing lists of potential carpoolers from all different areas. So, if you haven't already matched up with someone in your area or you're having trouble finding a fellow carpooler, please fill out the Carpool Registration Form found at the bottom of this page and send to Commuter Services C1/A128 for a possible match-up in your neighborhood.

CARPOOL REGISTRATION FORM

NAME: _____

HOME ZIP CODE: _____

WORK HOURS: _____

EXTENSION: _____

How many days a week are you willing to carpool? _____

Please return to Commuter Services C1/A128.

Twice a Week is All We Ask.....

NO SINGLE OCCUPANCY VEHICLES

It's not easy to start carpooling!! Most people can come up with any number of reasons why they can't carpool: I might need to make stops after work . . . What if my child gets sick? . . . I have class one night a week . . . I like the solitude of driving alone . . . the list goes on and on.

The truth of the matter is, if you're not part of the solution, you're part of the problem. And that problem is only going to get worse unless we start to tackle it NOW.

The South Coast Air Quality Management District (SCAQMD) estimates that by the year 2010, 42 percent more vehicles will be using Southland roads. Average road speeds will decrease from 31 to 11 mph, and rush-hour trips will take up to three times longer.

A ROUND OF APPLAUSE

We would like to take this opportunity to thank all Corporate employees presently vanpooling, carpooling, or using an alternate mode of transportation, for your cooperation and support in our clean air efforts. Remember to register at Commuter Services to be eligible to take advantage of our Guaranteed Ride Home Program.

These are pretty scary statistics. Air quality in the Los Angeles basin already fails to meet minimum federal health standards more than 200 days out of each year. Unless we act quickly, our lungs as well as our roads will be almost completely clogged.

The AQMD has outlined a 20-year plan to reduce traffic congestion and air pollution. A major component of the plan is Regulation XV, a California state law that requires organizations to reduce the number of vehicles that arrive at work sites between 6 and 10 am. It states they must do so through an alternate commute mode . . . in other words no SOV's (Single Occupancy Vehicles). We must achieve an average of 1.5 employees per vehicle.

Presently at Corporate approximately 250 employees live within a 15-mile radius of our worksite. This is perfect for carpooling. Call Carole in the Commuter Services office and she will provide you with a list of potential carpoolers from your area.

The time has obviously come for employees to stop making excuses and start ridesharing — if not everyday, then at least 2 or 3 days a week.

Remember, if you're not thinking of yourself, think of your children . . .

TRW

TRW Clean Air Program

Preferred Space Park(ing)

Industry experience shows that one of the strongest incentives for employees to rideshare is preferential parking for car/vanpools. TRW has committed to preferential parking as a rideshare incentive in its Trip Reduction Plan required by South Coast Air Quality Management District Regulation XV.

Preferential parking is not a return to named reserved spaces, but is being made available to all employees. It is an employee incentive gained by contributing to a cleaner environment, reducing traffic congestion, and helping the company meet its mandated goals.

In July, preferred parking spaces will be available for employees who are registered as a TRW car/vanpool participant. Spaces will be distinctively painted. Authorized users will receive a special permit to display on their vehicle's rearview mirror.

If you do not have someone for ridesharing, contact the Commuter Services Office at Extension 34431 for a registration form. A computer match list of TRW employees in your immediate home vicinity will be sent to you.

Every employee at greater Space Park is eligible to take advantage of this rideshare preferred parking incentive. To join in the rideshare program, contact Commuter Services Office located in Building 108A, Room 1481.

Commuter Services Office

TRW Clean Air Program

This Is MAX!!

MAX, the 1st Class Commuter Bus, begins service on April 18, 1990. Buses from the South Bay to the El Segundo employment center will arrive at 20 minute intervals. Comfortable airline-style seats and individual reading lights will make your commute a delight.

MAX Commuter Kits (containing free rides, schedule, and map) will be sent the week of 4/2/90 to employees who reside in the MAX service area. Monthly passes will be $54 and $45, depending upon whether you live north or south of Pacific Coast Highway. Beginning April 25, Employee Services will be selling passes in S/1470 and M5/1437 for the month of May. Sales will continue through the 10th of May. Buy one month's pass for full price, get your second month's pass FREE! Thereafter TRW will subsidize your pass at $15 per month.

Bike To Work Day

More than 36% of TRW's Space Park population lives within a 5-mile radius. If you fit into this category (or even if you don't), please join us on Tuesday, May 15 for **National Bike To Work Day** and ride **your bike** to work. We will be serving a continental breakfast in the S Waitress Dining Room between the hours of 6 and 9 a.m. Buttons and tickets for noontime drawings will be passed out, and Security will be provided for the bikes on the patio during breakfast.

Noontime activities on the S-patio between 11 a.m. and 1:30 p.m. include specialty booths, prize drawings and bike fashions for the 90's.

Join us in the fun and in demonstrating to others that the auto can be left at home for some trips.

Please return the portion below to Commuter Services, 108A/1481 if you plan to ride your bike to work on May 15 and attend the breakfast in the Waitress Dining Room. Hope to see you there!

Rideshare Week '89

Keep California Moving

Governor George Deukmejian has proclaimed October 2 through 6 California Rideshare Week. His challenge is to make all Californians aware of ridesharing benefits and encourage them to rideshare at least one day a week.

In support of the Governor's proclamation, TRW has set aside October 5 as "No Solo Day" at Space Park. Please join your fellow employees on this day and rideshare with a friend, walk, bicycle, or take a bus. Show the community we are committed to clean air.

Accept the "No Solo Day" challenge. Leave your wheels at home for just one day. See the difference you can make.

Take the pledge and become eligible for the October 5 "No Solo Day" raffle. Complete the pledge card below, detach, and drop in the company mail by October 3. This card is your ticket for a chance to win one of many great prizes at the "No Solo Day" raffle on the S-Patio, 11:00 a.m. to 1:30 p.m.

Don't forget! Thursday, October 5

"No Solo Day"

Prizes ★ Free Popcorn ★ Live Music

Commuter Gifts ★ Poolmatch Information ★ Car/Vanpool Registration

(Detach here and place in company mail)

"No Solo Day" Pledge Card

☐ Yes! I pledge to share the ride and "Keep California Moving" on Thursday, October 5!

I plan to commute by:

☐ Carpool ☐ Bicycle
☐ Vanpool ☐ Walk
☐ Bus

I am a "registered" ridesharer

☐ Yes ☐ No
☐ Carpool
☐ Vanpool

Optional Information
Please check as many as apply:
☐ I want to add passengers to my car or share the driving.
☐ I want to join a carpool as a passenger.
☐ I want to join a vanpool as a passenger.
☐ I want to be a vanpool or backup driver.

TRW

TRW Clean Air Program

Prize Drawing For All Registered Commuters

TRW's Commuter Services office is delighted to announce the Clean Air Program's first quarterly drawing. All ***registered*** carpoolers, cyclists, walkers, van and transit riders are possible winners. There is nothing to fill in or return; the names are available on our Poolmatch program.

The drawing for ***registered commuters*** will be held on June 27, 1990. Winners will be contacted by phone and the names will be published in the Read-out.

The next commuter quarterly drawing will be held near the end of September. If you are not currently a part of this program, call us at x34431 and register ***now***. Join the thousands of others here at TRW who are doing their fair share to clean up the air. Everyone wins!

- ★ **Weekend trip to San Francisco (air fare, accommodations–2 people, 2 nights)**
- ★ **Cordless telephone ★ 13" Color TV**
- ★ **Portable Stereo ★ Ice Cream Maker**
- ★ **Portable Compact Disc Player ★ Bicycle**
- ★ **Galleria Mall Gift Certificates in the following amounts: (1) $200, and (2) $100 gift certificates**

TESTIMONY BY
THE HONORABLE RAY GRABINSKI, VICE CHAIR
LOS ANGELES COUNTY TRANSPORTATION COMMISSION
BEFORE THE SUBCOMMITTEE ON SURFACE TRANSPORTATION
HOUSE COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION
JULY 2, 1990 - LONG BEACH CITY HALL

Members of the Committee:

Thank you for this opportunity to share the views of the Los Angeles County Transportation Commission (LACTC), as this Committee prepares next year to reauthorize the Surface Transportation Act.

Our mission in Los Angeles County, "leading the way to greater mobility," addresses the very same goals which led to the enactment of the Federal-Aid Highway and Highway Revenue Acts of 1956 and the Urban Mass Transportation Act in 1964.

The Commission sets policies and funds the county's rail development, streets and highways, buses, shuttles and paratransit services. Through Proposition A, the half-cent sales tax dedicated to public transit improvements we raise over $390 million annually which has been used to fund rail construction, support our bus system, and provide roughly 25% as a local return to the 87 Cities within Los Angeles County for a wide range of transit improvements.

We are grateful for the strong support which this Committee has provided to transit and highway programs in Los Angeles, especially the construction of the Los Angeles Metro Rail. Chairman Anderson, your personal leadership has made the difference to the people of Los Angeles in terms of securing federal support for the development of our county-wide rail system and other transportation improvements. Chairman Mineta, we very much look forward to working with you on these important issues.

Local Commitment to Transit

In 1980, the people of Los Angeles County demonstrated their commitment to alternative means of mobility with the enactment of Proposition A and its identified goal of developing a 150-mile county-wide rail transit system.

With your help, we have been able to embark upon an ambitious program of design and construction. On July 14, our first line, the LA Metro Blue Line begins operation from Long Beach to Los Angeles. By 2000, the Blue Line, which was built entirely with local funds, will carry 54,000 daily riders

Recognizing our tremendous need and local commitment, Congress has strongly supported authorizations and appropriations for the Metro Red Line, our 17.4 mile subway from Union Station to the San Fernando Valley.

In 1990, the people of California demonstrated their commitment to the completion of this system, as well as highway, commuter and inter-city rail projects throughout the state with their approval of gas tax increase and rail bond measures. Just as in 1980, these measures address funding of specific projects which can end our reliance upon single passenger vehicles for mobility.

As you begin work upon the reauthorization of the Surface Transportation Act, we ask that you again look at our needs, which continue to grow, and our strong local and state commitment as you identify projects which merit federal support. Transit must be broadened to include all high-occupancy, shared-ride services with goals of meeting diverse travel needs while reducing vehicle miles travelled.

We also recognize that you need national involvement and support to win Congressional and Presidential approval of the type of Surface Transportation Act which America needs to restore the Intergovernmental Funding Partnership.

Those Senators and Congressmembers not serving on the authorizing Committees for this act must recognize that mandates for clean air, accessibility and infrastructure repair cannot be achieved when the federal share of transit funding declines from 47% to 29% and highway funding declines from 30% to 23% as it has during the period from 1981 to 1987.

It is clear that revenues and taxes are major concerns for the President and Congress and we must ensure that any consideration of these issues provides an increase in the dedicated revenue directed to transit and highways. Chairman Anderson has championed this cause with his resolution specifying that any federal gas tax increase remain directed to our pressing national transportation needs, not simply for deficit reduction. We must also ensure that revenues in the mass transit account of the trust fund are fully spent.

I want to share with you the LACTC's key thoughts regarding next year's reauthorization and provisions which are essential for our local efforts.

LA Metro Red Line

The LACTC is the lead agency managing the planning, design and construction of our rail system, including the Red Line subway currently under construction. The Red Line represents the backbone of this 150-mile system, serving the central business district and its most heavily travelled corridors with transfers to locally constructed lines.

The need for the Red Line remains critical as congestion in the regional core will increase substantially over the next ten years. Vehicle miles travelled in the core, without the Red Line, are projected to increase over 25% from 14.2 to 17.8 million miles daily by the year 2000.

MOS-1

We are nearing 65% completion of the first 4.4 mile segment from Union Station to MacArthur Park, known as MOS-1. Congress was instrumental in overcoming objections by the previous Administration to participate in the 50% federal share of this $1.3 billion project which includes the starter segment, operational systems and maintenance yard and shops. This segment is fully funded and begins service by 1994.

MOS-2

On April 10, both Chairmen Anderson and Mineta joined Secretary Skinner and UMTA Administrator Clymer for the signing of the full-funding grant agreement which provides the financing for construction of the next 6.7 miles and eight stations, known as MOS-2. This extension proceeds northwest to a station at Wilshire and Vermont where the alignment branches both north and west. The northern terminus extends to Hollywood and Vine (1998 opening), while the western terminus extends to Wilshire and Western (1996).

Provisions in the Surface Transportation Act of 1987 requiring a full-funding contract for MOS-2 were critical to winning approval for the $667 million federal share, representing 46% of financing for this segment.

While Congress has continued a strong level of appropriations annually for the Red Line, we expect that between $180-200 million of this contract will not have been appropriated when this Act expires next year. As such, depending upon the legal interpretation of the contract in light of the congressional budget process, your support may be needed to extend the authorization and allow Congress to finish the funding of this segment in 1992.

MOS-3

MOS-3 consists of 6.3 miles and three stations which will extend the Red Line into the San Fernando Valley, extending west from Hollywood and Vine to Hollywood and Highland and then northwest to Universal City and on to North Hollywood terminating at Lankershiem and Chandler Boulevards. In North Hollywood, the Red Line will connect to a locally funded line serving West Valley communities expected to begin when the final Red Line station opens in 2001.

It is critical that this reauthorization mandate a full-funding contract for MOS-3, as was required for MOS-2. We are seeking an authorized federal share of $688 million of this $1,087. billion overall project. Because of the magnitude of this project, it is imperative that Congress convey its belief that the project must be completed to this administration.

Only your continued support can ensure that we proceed with the construction of this final segment without the delays which have contributed to cost increases in the first two segments. While these increases are funded locally without an increased federal share, their impact is to lessen available local support for construction of other lines which contribute to the success of the overall system.

Metro Orange Line

As you know, Congressional mandates required the realignment of the Metro Red Line and led to the establishment of the route now under construction. During this planning process and consultation with our Congressional delegation, the strong need and desire for eastern and western extensions of the heavy rail subway have been firmly established.

Through a system planning study prepared by the Southern California Association of Governments (SCAG) we have identified several routes within the identified residential and business corridor that extend from Santa Monica to Norwalk which meet UMTA's criteria for cost effectiveness and ridership.

The LACTC has designated this future heavy rail route as the Metro Orange Line extending west of Wilshire/Western and east of Union Station. Following UMTA's process for project development and approval, we have completed and submitted both the System Planning Study prepared by SCAG, demonstrating the existence of an east-west corridor and future ridership, and the Transitional Analysis which identify potential routes.

We have consulted with members of our Congressional delegation and have received an extremely positive response to the Orange Line and their commitment and interest in supporting public participation to select a final route through the Alternatives Analysis process.

Over the next two to three months, we will work closely with UMTA to secure their approval of the Transitional Analysis so that we can advance to Alternatives Analysis. Members of our Congressional delegation have pledged support to win UMTA approval.

We have met with this Committee's staff to provide these planning documents and pledge to consult with you on our progress. We also seek your support for authorization of $50 million to match local funds for the final design and preliminary engineering work which will be necessary to secure project approval and a full funding grant agreement.

Although specific authorizations for construction of the Orange Line will likely wait until the 1997 authorization, we anticipate that extensions of up to eight miles in east and west directions can begin construction by 1996 and last six years with a total project cost of $2.2 billion and 50% federal share.

Overall Funding of Rail Construction

To provide perspective on these funding requests, and the extent to which we overmatch Section 3 support, federal funding accounts for 52% of the entire Metro Red Line project. When you factor in our funding for the entire Light Rail system, comprising over 60 miles which will be in operation by 2001, federal funding represents just 21% of total rail construction dollars spent.

Highway Programs

As you know, the Federal Highway Act of 1987 authorized the Combined Road Plan (CRP) Demonstration Program. California joined the CRP on June 1, 1989 which tests pooling of funding categories of Federal-Aid Urban, Federal Aid Secondary and Highway Bridge Replacement and Reconstruction.

These block grants provide greater coordination of funding throughout the State. The California Department of Transportation is taking the lead in implementing these programs in consultation with local governments and specifically the LACTC. LACTC staff is participating on the statewide CRP committee and we are implementing a program to accelerate expenditure of CRP resources by giving higher preference to ready-to-go projects in Los Angeles County.

Recognizing that California was added late to the five-state demonstration of CRP, our support of its continuation is contingent upon continued emphasis on local decision making and funding allocations.

Smart Street Demonstration Programs

An area that is gaining interest at the national and local level is advancing Intelligent Vehicle Highway Systems (IVHS) and locally the multi-agency Smart Street Demonstration Program.

Smart Streets utilize advanced technology to reduce congestion, pollution, and travel delays through improved traffic management and information so drivers can make informed decisions about alternate routes when accidents or delays occur.

LACTC is involved in a local-state-federal demonstration using the Santa Monica Freeway, recognized as one of the world's most heavily travelled and congested freeways.

Based upon our experience during the LA Olympics using elements of this technology in the USC-Coliseum area, we believe that motorist on the Santa Monica Freeway can reduce travel times by 15%, with a resulting reduction in fuel use of 13% and pollution emissions of 10%.

Although the Federal Highway Administration is involved in this effort, there are currently no federal research or demonstration funds dedicated to the Santa Monica Smart Street Project. The project, scheduled to begin in 1993, costs $50 million for implementation and evaluation, and shortfall of $3 million has been identified for which federal funds are being sought.

A recently concluded statewide Smart Corridor study found 16 corridors among 120 candidates covering over 1,000 miles of California freeways that would yield a benefit in excess of three times their cost to construct and operate. It is no surprise that half of the top 16 candidates are in Los Angeles County.

There is currently proposed $15 million for IVHS research and programs within the FHWA 1991 budget. We encourage this Committee to look at the potential of such programs and the role which the federal government should have in providing matching funds for local projects which advance our understanding of the potential benefits of making smart our busiest corridors.

Secure Funding for Bus Operations

Today, you will hear from bus operators within the County, including the Southern California Rapid Transit District, which until this month has been this nation's largest all-bus transit system.

LACTC is a major funding partner to the District, providing more than 25% of its budget through Proposition A funds. We are also strongly involved with the twelve other municipal bus operators within Los Angeles County. (For example Long Beach, Santa Monica, etc.)

The continued availability of Section 9 operating assistance is absolutely vital to the health of our bus system which will continue to have an integral role in future mobility. Reductions in operating assistance, especially when combined with clean fuel requirements, will have a devastating effect on all of our municipal operators. The impact is particularly harsh for smaller operators who often rely, to a greater extent, on this subsidy than do larger operators.

Such subsidies must encourage cost-effectiveness and service quality, and we have been involved in a variety of strategies to achieve this goal. We have also led the establishment of the Foothill Transit Zone which has demonstrated that competitive bidding can result in a operators can complement a regional bus system through quality, cost-effective service which would otherwise not be provided.

Conclusion

Mr. Chairman and members of the Committee, I greatly appreciate this opportunity to share with you the exciting challengers which we are facing in the effort to improve mobility and meet needs of Southern California.

This decade can revolutionize the way that people of Los Angeles travel. We are implementing an ambitious program, and we have strong local and business support. However, there is no substitute for a federal role in funding a comprehensive approach here and nationwide which leads to mobility and environmental quality.

We have a responsibility to work not only as financial partners but as strong advocates for the federal role in transit. The LACTC pledges to make every effort to support this Committee in its efforts to fashion a solid reauthorization bill for the future of this region and the country.

RAIL TRANSIT IN LOS ANGELES COUNTY

- Proposition A is Los Angeles County's half-percent sales tax for public transit, passed by county voters in 1980.

- 35 percent of these tax revenues (about $130 million per year) is dedicated to the construction and operation of a rail transit system serving the entire county. Rail lines will be built in the transportation corridors outlined on the map below.

- The Red Line, whose initial 4 miles will run underground from Union Station to Wilshire Blvd./ Alvarado St., will serve the densely populated regional core of the county; it is being built with federal, state, private benefit assessments, and Proposition A funds.

- The Blue line from downtown Long Beach to downtown Los Angeles is funded entirely with Proposition A funds.

- The LACTC also is building the Green line with Proposition A funds in the middle of the new I-105 Freeway. The line turns southward near LAX to serve the El Segundo employment area; in the future, plans call for extensions north and south along the coast.

- Projects are being developed in other corridors as well. The LACTC is studying possible routes for an east-west rail line in the San Fernando Valley and for a line from downtown L.A. to Pasadena. In the San Gabriel Valley, when passenger-demand warrants, the El Monte Busway can be converted to rail. Caltrans is designing an exclusive busway along the Harbor Freeway, which will serve the needs of that corridor and also may be converted to rail at some time in the future.

For more information, please call the LACTC's rail hotline

TESTIMONY BEFORE THE SUBCOMMITTEE ON SURFACE TRANSPORTATION

OF THE HOUSE PUBLIC WORKS AND TRANSPORTATION COMMITTEE

LONG BEACH, CALIFORNIA

JULY 2, 1990

BY:

HONORABLE JEFFREY KELLOGG
COUNCILMAN, CITY OF LONG BEACH

REPRESENTING THE

CONSOLIDATED TRANSPORTATION CORRIDOR JOINT POWERS AUTHORITY
6550 MILES AVENUE
HUNTINGTON PARK, CALIFORNIA 90255

TESTIMONY OF

THE CONSOLIDATED TRANSPORTATION CORRIDOR

JOINT POWERS AUTHORITY

BEFORE THE SUBCOMMITTEE ON SURFACE TRANSPORTATION

OF THE HOUSE PUBLIC WORKS AND TRANSPORTATION COMMITTEE

LONG BEACH, CALIFORNIA

JULY 2, 1990

CHAIRMAN MINETA, CHAIRMAN ANDERSON, AND DISTINGUISHED MEMBERS OF THE SUBCOMMITTEE, GOOD AFTERNOON. MY NAME IS JEFFREY KELLOGG. I AM THE COUNCILMAN FROM THE EIGHTH DISTRICT OF THE CITY OF LONG BEACH, AND LONG BEACH'S REPRESENTATIVE TO THE CONSOLIDATED TRANSPORTATION CORRIDOR JOINT POWERS AUTHORITY. I ALSO SERVE AS CHAIRMAN OF THE JPA'S LEGISLATIVE COMMITTEE.

ON BEHALF OF THE ENTIRE GOVERNING BOARD OF THE JOINT POWERS AUTHORITY AND ITS CHAIRPERSON, LOS ANGELES CITY COUNCILWOMAN JOAN MILKE FLORES, I WOULD LIKE TO ADD MY WELCOME TO YOU THIS AFTERNOON. WE ARE EXTREMELY GRATEFUL FOR THE SUPPORT THAT YOU HAVE SHOWN FOR THE TRANSPORTATION NEEDS OF SOUTHERN CALIFORNIA. THANKS TO YOUR LEADERSHIP, CHAIRMAN ANDERSON AND CHAIRMAN MINETA, AND TO THAT OF YOUR COLLEAGUES ON THIS COMMITTEE, THE ECONOMIC BENEFITS FOR OUR COUNTRY ASSOCIATED WITH THE GROWTH OF THE PORTS OF LOS ANGELES AND LONG BEACH CAN BE PRESERVED. YOU HAVE CHAMPIONED THE CONCEPT THAT PORT GROWTH CANNOT BE SUSTAINED WITHOUT COMMENSURATE INCREASES IN ROAD AND RAILWAY ACCESS TO THE PORTS. WE CANNOT AGREE WITH YOU MORE. WE STRONGLY BELIEVE THAT THE CONSOLIDATED TRANSPORTATION CORRIDOR IS THE KEY TO FACILITATING PORT GROWTH,

WHILE ASSURING THAT NEIGHBORHOOD QUALITY OF LIFE IS PRESERVED.

THIS PROJECT WILL CREATE A HIGHWAY AND RAIL SYSTEM OF NATIONAL SIGNIFICANCE, CONNECTING THE ECONOMIC CENTER OF THE SAN PEDRO BAY PORTS -- THE LARGEST PORT COMPLEX IN THE UNITED STATES -- TO THE INTERSTATE HIGHWAY SYSTEM AND THE NATIONAL RAILROAD SYSTEM, THEREBY FACILITATING THE MOVEMENT OF INTERNATIONAL CARGO. THE PROJECT IS DESIGNED TO FACILITATE PORT ACCESS, WHILE MITIGATING POTENTIALLY ADVERSE IMPACTS OF PORT GROWTH, INCLUDING HIGHWAY TRAFFIC CONGESTION, AIR POLLUTION, VEHICLE DELAYS AT GRADE CROSSINGS, AND IMPACTS OF TRAIN NOISE IN RESIDENTIAL AREAS.

THESE ARE TRULY EXCITING TIMES. AS THE GATEWAY TO THE PACIFIC RIM, THE PORTS OF LOS ANGELES AND LONG BEACH ARE EXPERIENCING DRAMATIC GROWTH. IN 1989, THE TWO PORTS COMBINED HANDLED A TOTAL OF 139 MILLION METRIC REVENUE TONS OF CARGO, UP 6 PERCENT FROM THE PREVIOUS YEAR. GROWTH IN INTERMODAL, OR CONTAINERIZED, CARGO ACCOUNTS FOR A SIGNIFICANT SHARE OF THE PORT'S RECENT SUCCESS. THE TWO PORTS HANDLED A TOTAL OF 3.6 MILLION TWENTY-FOOT-EQUIVALENT UNITS (TEUS) IN 1989, AN INCREASE OF NEARLY 14 PERCENT OVER THE PREVIOUS YEAR.

BY THE YEAR 2020, THE PORTS ANTICIPATE NEARLY 12 MILLION TEUS ANNUALLY. TRAIN TRAFFIC TO AND FROM THE PORTS IS EXPECTED TO INCREASE FROM 31 TRAINS PER DAY CURRENTLY TO 106 TRAINS PER DAY BY THE YEAR 2020. TRUCK TRAFFIC TO AND FROM THE PORTS AMOUNTS TO ABOUT 17,000 TRIPS PER DAY NOW. THIS COULD TRIPLE BY THE YEAR 2020. WITH VOLUMES OF THIS MAGNITUDE, MAJOR IMPROVEMENTS IN RAIL AND HIGHWAY INFRASTRUCTURE WILL BE REQUIRED, AND SIGNIFICANT

38-253 O—91——71

INVESTMENTS IN MITIGATIONS, SUCH AS GRADE SEPARATIONS AND SOUNDWALLS, WILL BE NECESSARY.

WE STRONGLY BELIEVE THAT THE CONSOLIDATED TRANSPORTATION CORRIDOR WILL PROVIDE THE NECESSARY MITIGATIONS, AS WELL AS THE NEEDED IMPROVEMENTS IN TRANSPORT CAPACITY. THE CONSOLIDATED TRANSPORTATION CORRIDOR JOINT POWERS AUTHORITY IS THE AGENCY RESPONSIBLE FOR IMPLEMENTING THIS IMPORTANT PROJECT.

FORMED IN AUGUST OF 1989, THE JPA HAS A GOVERNING BOARD OF 15 MEMBERS, REPRESENTING THE CITIES OF LOS ANGELES AND LONG BEACH, THE LOS ANGELES COUNTY BOARD OF SUPERVISORS, THE LOS ANGELES COUNTY TRANSPORTATION COMMISSION, THE TWO PORTS, CALTRANS, AND EACH OF SIX CITIES ALONG THE CORRIDOR: CARSON, COMPTON, LYNWOOD, SOUTH GATE, HUNTINGTON PARK, AND VERNON. MEMBERS OF THE JPA ARE WORKING TOGETHER, IN A SUCCESSFUL COLLABORATIVE EFFORT, TO SOLVE THE INFRASTRUCTURE AND ENVIRONMENTAL PROBLEMS ASSOCIATED WITH IMPROVING PORT ACCESS.

THE ESTIMATED COST OF THE CONSOLIDATED TRANSPORTATION CORRIDOR IS $502 MILLION, NOT COUNTING THE COST OF PROJECTS ALREADY FUNDED THROUGH THE FEDERAL PORTS ACCESS DEMONSTRATION PROGRAM. ALSO NOT INCLUDED IN THIS ESTIMATE IS $297 MILLION OF IMPROVEMENTS IN HIGHWAY AND RAIL INFRASTRUCTURE WITHIN THE HARBORS THAT WILL BE FUNDED DIRECTLY BY THE PORTS.

THE CONSOLIDATED TRANSPORTATION CORRIDOR INVOLVES DOUBLE TRACKING THE SAN PEDRO BRANCH OF THE SOUTHERN PACIFIC RAILROAD AND INSTALLING CENTRALIZED TRAFFIC CONTROL. THE GOAL IS TO HAVE ALL

THREE RAIL CARRIERS (THE UNION PACIFIC, THE SANTA FE, AND THE SOUTHERN PACIFIC) USE THIS ONE UPGRADED ROUTE. THE SOUTHERN PACIFIC SAN PEDRO BRANCH RUNS THROUGH A PREDOMINANTLY INDUSTRIAL CORRIDOR, WHICH IS MORE COMPATIBLE WITH HEAVY FREIGHT TRAINS THAN THE OTHER RAILROAD BRANCH LINES, WHICH ARE HIGHLY RESIDENTIAL.

CONCENTRATING OUR INVESTMENTS IN GRADE SEPARATIONS AND OTHER MITIGATIONS IN THIS ONE CORRIDOR MAKES GOOD ECONOMIC SENSE. THE COSTS OF MITIGATING IMPACTS ON ALL THE RAILROAD BRANCH LINES SERVING THE HARBORS WOULD BE ASTRONOMICAL.

THE PROJECT ALSO INVOLVES WIDENING ALAMEDA STREET FROM FOUR TO SIX LANES FROM THE PORTS TO INTERSTATE 10, NEAR DOWNTOWN LOS ANGELES. FORTUNATELY, THROUGH THE ASSISTANCE OF CONGRESSMAN ANDERSON AND THE MEMBERS OF THIS COMMITTEE, FUNDS FOR THREE OF THE GRADE SEPARATIONS AND FUNDS FOR THE WIDENING OF ALAMEDA STREET SOUTH OF STATE ROUTE 91 ARE ALREADY AVAILABLE. THE PORTS ACCESS DEMONSTRATION PROJECTS, FUNDED IN 1982 AND 1987, HAVE BEEN A MAJOR FACTOR IN THE PORTS CONTINUED GROWTH AND PROSPERITY.

ON JUNE 5TH, CALIFORNIA VOTERS PASSED PROPOSITIONS 108, 111, AND 116, WHICH COMBINED WILL PROVIDE A TOTAL OF $18.5 BILLION IN ADDITIONAL REVENUE FOR TRANSPORTATION PROJECTS OVER THE NEXT TEN YEARS. $80 MILLION FROM PROPOSITION 116 IS SPECIFICALLY EARMARKED FOR GRADE SEPARATIONS ALONG THE ALAMEDA STREET CORRIDOR. WE HAVE ALSO APPLIED FOR $25 MILLION OF PROPOSITION 111 RELATED FUNDS FOR THE WIDENING OF ALAMEDA STREET BETWEEN ROUTE 91 AND THE GLENN M. ANDERSON FREEWAY.

ADDITIONAL FUNDING FOR THIS PROJECT COULD COME FROM MITIGATION FEES COLLECTED BY THE PORTS AND CONTRIBUTIONS FROM THE RAILROADS. WE ARE MAKING A SIGNIFICANT STATE AND LOCAL COMMITMENT TO THIS PROJECT, BUT WE ALSO FEEL THAT FEDERAL ASSISTANCE IS JUSTIFIED. THE SAN PEDRO BAY PORTS PLAY A VITAL ROLE IN INTERNATIONAL TRADE, ECONOMIC DEVELOPMENT, AS WELL AS NATIONAL DEFENSE. THUS, THERE IS A STRONG COMPELLING ARGUMENT FOR SPECIFIC FEDERAL ATTENTION TO THIS PROJECT. WE RESPECTFULLY REQUEST THAT THERE BE RECOGNITION AND FEDERAL FUNDING COMMITMENTS FOR THE CONSOLIDATED TRANSPORTATION CORRIDOR IN THE FEDERAL-AID HIGHWAY REAUTHORIZATION BILL, WHICH IS CURRENTLY BEING DRAFTED.

FAILURE TO BUILD THE CONSOLIDATED TRANSPORTATION CORRIDOR WOULD BRING CONTINUED ENVIRONMENTAL DEGRADATION TO THE COMMUNITIES SURROUNDING THE HARBOR AREA, AS WELL AS THREATEN A SIGNIFICANT DIVERSION OF CARGO TO OTHER WEST COAST PORTS. AT STAKE ARE ABOUT 37,000 TRADE RELATED JOBS THAT COULD BE LOST BY THE YEAR 2020, AND $6 TO $8 BILLION IN CUSTOMS REVENUES THAT WOULD BE LOST IF THE PORTS' PROPOSED EXPANSION WAS CURTAILED.

THE CONSOLIDATED TRANSPORTATION CORRIDOR REPRESENTS A SIGNIFICANT STEP FORWARD IN FACILITATING GOODS MOVEMENT, A SHARPER COMPETITIVE EDGE, AND ECONOMIC GROWTH FOR THIS COUNTRY WHILE ASSURING THAT NEIGHBORHOOD QUALITY OF LIFE IS PRESERVED. WORKING TOGETHER, I AM CONFIDENT THAT THESE GOALS WILL BE ACHIEVED.

THANK YOU VERY MUCH. I WOULD BE HAPPY TO ANSWER ANY QUESTIONS YOU MIGHT HAVE.

FAX (805) 642-4860

Mr. Chairman and Members of the Subcommittee, I am Ventura County Supervisor Susan Lacey, Chair of the Ventura County Transportation Commission, which represents 10 cities and County of Ventura. I am testifying today on behalf of the Commission, the South Coast Area Transit and the Port of Hueneme. Thank you for the opportunity to address the Committee on reauthorization of the federal surface transportation program. First, as it relates to the County's public transit operators, and then, the Port of Hueneme.

TRANSIT

South Coast Area Transit, or SCAT, is the major transit operator in Ventura County, serving over 300,000 residents. Approximately 32% of SCAT's annual budget, or $5 million, is comprised of Federal operating assistance under Section 9 of the Urban Mass Transportation Act.

SCAT's most immediate concern is the continuance of Federal capital and operating assistance under the formula grant program which was established through the Surface Transportation Assistance Act. Initially, when this Federal provision was enacted, SCAT was eligible to receive 50% of its operating budget from Federal funds. However, with the enactment of an operating cap in 1978/79, the agency was prevented from using more than $1.8 million in Federal operating assistance. Since that time, the Gramm-Rudman-Hollings Act has reduced the funds even further to $1.3 million. This has placed a substantial burden on the agency when mass transit is one of the prime alternatives to improve air quality and provide transportation mobility to the handicapped.

With the best of intentions, Congress in considering revisions to the Clean Air Act and is reviewing the Americans with Disabilities Act (ADA). However, there has been no consideration for funding the transportation alternatives that these legislative enactments mandate. It is most disturbing that the Administration's proposed transportation policy has targeted mass transit for further reductions or elimination of funding altogether, despite the needs for suburban and rural mobility.

Although support for transit funding is one of several local policy efforts, it is also one of national significance. We believe that the re-authorization of the Surface Transportation Assistance Act should include funding for both transit operating and capital programs at current or greater levels.

PORT OF HUENEME ACCESS IMPROVEMENTS

For those of you not familiar with the area, the Port of Hueneme is located about sixty miles north of Los Angeles. It is one of only four commercial ports in Southern California - a region that exceeds many nations in terms of economic impacts. The Port is located in the vicinity of the Naval Construction Battalion Center (home of the Navy's famous Seabees) and the Pacific Missile Test Center.

It is clear the economic impact of the facility like the Port of Hueneme extends beyond the local area's boundaries. The Port plays a vital role in the distribution of goods, but also provides substantial economic benefits to the State and the Nation, in terms of jobs, personal income, business revenue, and taxes. Port facilities operate as one of the main fronts in resolving the trade imbalance issue. Our Nation's ports, like the Port of Hueneme, play a vital role in international trade, economic development, and the national defense. The Port of Hueneme also serves as a facility for handling offshore oil developments in California.

The Port of Hueneme is connected by rail to other areas, but, unfortunately, is the only deep water port between Los Angeles and San Francisco without direct freeway access. Port traffic must travel on urban arterials to connect the docks with the nearest freeway, U.S. 101. Port and Navy traffic must also compete with background residential and commercial traffic for space on local roadways. To reduce congestion, noise, and damage to air quality additional highway capacity is needed. Lack of additional capacity could ultimately constrain the growth of the Port of Hueneme and interfere with important missions of the Naval facilities in the area.

To address these problems, local governments have developed the Port of Hueneme Access Improvement Plan. The Southern California Association of Governments (SCAG) has endorsed this plan and included projects in it in SCAG's Regional Mobility Plan. The Port of Hueneme Plan has received endorsement from the County and cities of Ventura, as well as from the Department of the Navy, the California Department of Transportation, Southern Pacific Railroad, offshore petroleum companies, the Automobile Club of Southern California, and the California Trucking Association.

I would be glad to send the Committee specifics about the access projects contained in the Port of Hueneme plan. We have made progress in implementing the Ports Access Plan since Congressman Anderson visited the Port in December of 1988. The three main projects listed in the plan are:

- Rice Avenue extension and State Route 1 Interchange
  (This road is a nonexistent "missing link" which must be constructed for the Rice Avenue/Hueneme Road corridor to function as the main access from south of the Port.)

- Hueneme Road improvements
  (This road widening is needed in conjunction with the Rice Avenue extension.)

- Victoria Avenue improvements
  (This work, including reconstruction of the Victoria Avenue and U.S. 101 interchange, is the third essential link in Port access improvements.)

At present, costs for the port access projects total $84.4 million. Thus far, we have been able to secure funding for the necessary local work. However, we will need federal assistance to make up the shortfall.

We are enthusiastic about this Committee's interest in the importance of intermodal and port access matters and believe it is essential that the reauthorization of the Surface Transportation Assistance Act specifically deal with this issue. We hope appropriate federal resources will be available to assist with implementation of access projects to keep the valuable natural resource of the Port of Hueneme an economic asset to this county and country.

Thank you for the opportunity to speak. On the other side of the folder is correspondence supporting my remarks. I'll be glad to answer any questions.

ORAL PRESENTATION BY
VENTURA COUNTY
SUPERVISOR SUSAN LACEY

"We are entering an era in which our ability to compete internationally is critical to our economic vitality and quality of life. To meet the changing demands of the international market place, we must have safe, efficient transportation to carry people where they want to go and to move the vast quantities of goods we produce and consume. Projected transportation needs for the 21st century eclipse our present public and private sector programs. We must broaden the base of support for transportation, reinvigorate investment, and tap new sources of ideas and capital to meet growing demands". --- Excerpted from "Moving America", A Statement of National Transportation Policy.

In today's global economy, the market for the interchange of imports and exports is no longer confined to the traditional, urban waterfront. Transportation facilities once constructed to support the general cargo steamship, today support new and different commercial interests and uses. The port facilities constructed on San Francisco's northern waterfront have been replaced with new and modern facilities located away from the traditional, downtown waterfront locations. In fact, as a result of this relocation the Port of Oakland has emerged as the primary container load center for Northern California.

In Southern California, the traditional Ports of Los Angeles and Long Beach have emerged as one of the world's largest container load centers, and they are today competing for the opportunity to serve the new "Post Panamax Container" vessel and the double-stacked intermodal, unit trains which are required to support them. This newer and larger vessel will require improvements outside of the traditional waterfront area.

As major container ports concentrate their efforts on the large container carriers, small ports, such as the Port of Hueneme, located in close proximity are becoming vital links for waterborne commerce that no longer fit into the large container port system. Small ports in the U.S. will have a service area of 200 miles, will serve non-containerized cargoes, and will transfer cargo primarily between truck and vessel; rail/truck/vessel transfers will however be important in regions that are served by main line rail service. (See Oxnard Harbor District Exhibit 1.)

In the 1990's and into the 21st century the handling of waterborne commerce will not be confined to historical, urban waterfront and large port load centers. The national transportation policy needs to include new policies and programs that recognize the

emergence of new port and intermodal regions, such as Ventura County's Port of Hueneme.

By 1989, the public investment made by individual California ports was approximately $2.4 billion (AAPA Survey).

The framework for this public investment is consistent with the themes identified in the National Transportation Policy.

The individual California port authorities have strived to:

- Maintain and modernize existing ports to avoid construction of new ports.
- Foster a sound financial base relying on port revenues to pay operation, maintenance, and modernization (user fees).
- Invest in cargo handling systems that improve the overall efficiency of port facilities.
- Protect the environment and the quality of life.

The California maritime and port industry comprises a partnership between public port entities and private sector steamship companies, terminal operators, and related industries.

The national transportation policy needs to recognize that the U.S. maritime/port industry is a private/public partnership.

The ports of California not only play a vital role in the distribution of goods, but they also provide substantial economic benefits to the State and the Nation, in terms of jobs, personal income, business revenue and taxes. (See Oxnard Harbor District, Economic Impact Study, Exhibit 2.)

"The California ports represent a $50-75 billion industry in the State, measured in terms of the direct, indirect, and induced effects on business revenues."

"Approximately 600,000-750,000 jobs statewide are directly or indirectly related to port activities."

"Federal customs receipts from California Customs Districts exceed $4 billion in 1988, up by more than 39% since 1984."

> "Combined total tonnage for California ports exceed 166 million metric revenue tons per year or over 56% of the total U.S. world trade. Nearly 14,000 vessels called at California's ports in 1988."
>
> Excerpts from "Improving Access to California Ports, February 1990.
>
> **The national transportation policy needs to recognize that port access projects are Federal transportation resources of national significance, and need not be directly linked with the interstate highway system.**

No waterborne transportation policy would be complete without addressing the need for our transportation system to remain competitive in international trade.

In 1986, the National Research Council, published Improving Productivity in U.S. Marine Container Terminals That report concluded:

> "U.S. marine terminals are generally employing state-of-the-art technology and engineering design.
>
> The best U.S. terminals are not as productive as the most productive foreign terminals for many reasons....
>
> Improvements in marine terminal productivity are important to the success of individual U.S. port interests in terms of their ability to compete in an economically deregulated, i.e. market driver, environment..."
>
> **The national transportation policy for highways needs to devote additional resources to the development of projects that foster new technological advances in marine terminal productivity, such as the development of highway improvements which support new automated terminal concepts. (See OMNIPORT® Hueneme Exhibit 3.)**

Finally, on October 17, 1989 the "Loma Prieta Earthquake" demonstrated the vulnerabilities of the transportation lifelines. The "Exxon Valez" accident in Alaska focused

national attention on the need for improvements in the nation's ability to prevent and respond to oil spills. The reduction of military spending in the upcoming years will place added reliance on joint public/private projects to maintain our national security.

To that extent, specific national highway projects should be funded when they provide access to U.S. military installations associated with our national sealift and airlift policy, when they provide access to U.S. response centers for oil spill prevention and clean-up, or when they provide access to ports that provide transportation lifelines during relief endeavors associated with national disasters such as the Loma Prieta earthquake.

PORT OF HUENEME

EXHIBIT 1

Map of State of California — Port Location

OXNARD HARBOR DISTRICT
PORT FACILITIES

The Oxnard Harbor District was organized under Act 3201 of the Californnia Statutes, 1931. The formation of the Oxnard Harbor District was approved by the voters at an election held on April 29, 1937, and validated by the 1937 California State Legislature. The Oxnard Harbor District is empowered by its authorizing statute and by the California Harbors and Navigation Code (Section 6000 et.seq.) to acquire, construct, own, operate, control or develop any and all harbor works or facilities within the limits of its established boundaries.

The initial Port of Hueneme harbor basin was dredged in 1938 and 1939, and the Port of Hueneme was officially opened on July 6, 1940. Less than two years later, on March 5, 1942, the U.S. Navy, through condemnation proceedings, acquired the entire Port of Hueneme property consisting of approximately 321 acres. The Navy subsequently built additional wharf facilities and has operated a military harbor at the Port of Hueneme from World War II to the present time. For thirteen years after World War II, the Oxnard Harbor District leased approximately 22 acres of it original holdings, including a 1,200 foot wharf from the U.S. Navy and operated it as the commercial segment of the harbor.

In 1985 with specific Congressional approval the Oxnard Harbor District purchased land and improvements from the U.S. Navy. This purchase was specifically for the expansion and enhancement of commercial port activities at the Port of Hueneme.

The port's facilities now consist of 3,200 linear feet of berth space, over 170,000 sq. ft. of transit shed space, and nearly 68 acres of terminal space valued at $33,893,498.

The Port of Hueneme has experienced a steady and strong vessel call and cargo growth rate throughout the 1980's. In the past four years, the number of deep draft ocean vessel calls has increased by over 30%.

It is projected that vessel calls at the Port of Hueneme will increase from 192 to over 350 per year by 1994.

Growth in vessel calls at the Port of Hueneme, over the next five years, will occur as a result of the following factors:

1. Growth in container vessel traffic at Los Angeles/Long Beach will result in a demand for more breakbulk type vessels to call at the Port of Hueneme. Additional customs, security and cargo handling capabilities must be available in Southern California to support all projected growth.

2. Noncontainer cargo vessel calls will continue to grow in Southern California resulting in an increased demand for service, specifically at the Port of Hueneme.

3. There are limited port expansion areas in Southern California due to environmental constraints from both Federal and State regulations. Therefore, vessel activities at the Port of Hueneme will grow naturally as a result of these constraints.

4. The Port of Hueneme is geographically situated to better serve the northern metropolitan Los Angeles area, the Central California area, and the Northern California area than other Southern California ports.

Like vessel calls, cargo import and export levels at the Oxnard Harbor District have increased. Since 1980, general cargo imports at the Port of Hueneme have increased by 129%, from 109,481 revenue tons to over 250,000 revenue tons in 1989. Cargo exports have increased by nearly 700% from 9,565 tons in 1980 to over 76,000 tons in 1989.

Shippers and carriers of noncontainerized cargo are seeking alternative port facilities away from the congested Los Angeles/Long Beach container load center. The Port of Hueneme provides this alternative.

Small semi-container carriers are seeking port facilities away from the congested Port of Los Angeles and Long Beach complex. For example, carriers and shippers, such as Tropical Shipping, Del Monte Tropical Fruit, NORSUL and Dole, are initiating service from Central and South America with semi-container vessels. These types of carriers traditionally call at small port facilities in the Gulf and East Coast regions of the United States.

The Port of Hueneme has approximately 1% of the total California market share of general cargo tonnage. By increasing its market share by an additional 1% the Oxnard Harbor District would add nearly one million tons of general cargo to its existing throughput. It is likely that the port will increase its general cargo market share.

IMPORT REVENUE TONNAGE
PORT OF HUENEME

Year	Based Upon Increased Import Vessel Calls	Based Upon OMNIPORT
Current	251,221	--
1991	550,352	--
1994	687,940	1,703,000

Tonnage increases are expected to come in part from the fresh fruit shipping locations such as Chile, New Zealand, Central America and Mexico; steel products from Brazil and Asia; and new liner services carrying cargo from Brazil, Equador, Costa Rica and Honduras. At the same time, the automobile imports from Japan, United Kingdom, and West Germany will produce an increase in cargo transactions.

As a result of a recent market study, conducted by the firm of Leeper, Cambridge and Campbell, Inc., the Oxnard Harbor District anticipates a marked increase in consumption entries and transaction work load.

By 1992, the Port of Hueneme market on the West Coast for non-containerized cargo is estimated to be 4,638,000 tons. This includes 1.7 million tons of imports and 2.9 million tons of export.

On December 11, 1989, the Oxnard Harbor District, Board of Harbor Commissioners, approved a contract with "CMT Systems" for creation of "OMNIPORT Hueneme".

CMT Systems is a partnership of Bechtel Civil, Inc. and Continental Marine Terminals (USA) Ltd. CMT Systems proposes to develop, finance, construct, own and operate an automated break-bulk cargo handling terminal at the Port of Hueneme.

It is estimated that the project cost will be between $80 million and $100 million. Modernization of facilities will be made by the Oxnard Harbor District. Terminal construction and improvements will be financed privately.

Currently, one OMNIPORT facility is in operation in the United States. OMNIPORT Houston initiated service this year and Hueneme is one of five OMNIPORT facilities planned for the United States.

The Port of Hueneme was selected because of its proximity to the Southern California market. Specific cargoes targeted include fruit, vegetables, meat, fish, grain, seeds, feed, cotton, woodpulp, lumber and steel.

OXNARD HARBOR DISTRICT
PORT OF HUENEME

ECONOMIC IMPACT REPORT

PORT OF HUENEME ECONOMIC IMPACT ON VENTURA COUNTY (1989)

I. INTRODUCTION

The following analysis estimates the economic impact of the Port of Hueneme on Ventura Country in 1989 dollars with and without the planned OMNIPORT® facility. Economic impact is defined as the local revenues, employment, income and taxes which result from activities associated with the port.

II. METHODOLOGY

The impact estimates are based on the Port Economic Impact Kit (PEIK) developed by the Maritime Administration. The model utilizes user-specified inputs on port and local economic activity in conjunction with implicit relationships defining various port, industrial and economic sectors. The model uses these inputs to estimate the direct impact of port and port-related activities and induced impacts resulting from secondary purchases in the local economy.

The model's input sets include the following groups:

- Port Industry/Cargo - Cargo volumes, inland transportation characteristics by mode (modal split, cost per ton-mile and average length of haul), and direct expenditure impacts (e.g., port services and supplies, cargo expenses and crew expenditures) by commodity type (breakbulk, autos, liquid bulk and "OMNIPORT®").

- Local Port User - Employment by industrial sector for county businesses "dependent" on the availability of a commercial port.

- County and City Economic - Employment and earnings by BEA industry, total personal income and earnings, local labor use, and local tax revenues for Ventura County.

The model utilizes the "cargo" inputs to generate direct revenue flows to transportation-related industries providing the various port- and cargo-support services and materials. Based on the industrial structure of the local economy (as defined by the "county economy" inputs relative to national industrial factors), direct port expenditures are either distributed to county businesses, households and government or "leaked" to those sectors outside of the county.

The employment levels for "local port users" are utilized to estimate direct revenue, income and tax impacts which are similarly distributed between "local" and "non-local" sectors.

Induced impacts include the local economic activity which results from secondary (and additional) purchases by local businesses, households and government using the direct impact receipts. The "multiplier" is the relationship between total and direct impacts and measures the extent to which local expenditures are retained within the county.

This application of the model utilized both default values in the model (updated to a 1989 timeframe) and port-specific data as available from the Oxnard Harbor District (OHD) and other sources. (Survey data from previous economic impact analyses for the port were utilized.) The following sections describe how the inputs were developed.

Port/Industry Cargo Inputs

The following cargo volumes were based on fiscal year 1989 figures as provided by OHD and CMT Systems (CMTS) estimates for new cargoes attracted to OMNIPORT® HUENEME:

Breakbulk	389,000 Tons
Automobiles	111,000
Liquid Bulk	247,000
	747,000 Tons
OMNIPORT® Estimate	2,000,000 Tons.

Total revenue tons as utilized in the model were based on actual cargo tons, except for automobiles which had a 7-to-1 ratio of revenue to cargo tons. It was estimated that one-third of all vessels for breakbulk, automobile and OMNIPORT® cargoes would bunker at the port, compared to only one-fifth of liquid bulk carriers. No locally refined bunker fuel was assumed.

The inland transportation characteristics were developed for each cargo group based on national productivity and cost averages and modal splits as estimated in the Transportation Systems Management (TSM) Study and by CMTS. The modal splits utilized were:

Breakbulk	100% Truck
Automobiles	70% Truck/ 30% Rail
Liquid Bulk[1]	17% Truck/ 83% None
OMNIPORT®	69% Truck/ 31% Rail.

The average length of haul for breakbulk cargoes were based on a weighted average of estimates for specific cargoes as derived from previous cargo studies. The unit transportation cost was

[1] Shipments to the SCE plant are delivered directly by pipeline while the offshore oil shipments utilize local trucking.

similarly a weighted average of the American Trucking Association's (ATA) 1987 average cost per ton-mile for refrigerated and general cargoes escalated to 1989 using the Consumer Price Index (CPI). The same average length of haul and unit cost figures were used for OMNIPORT® truck shipments. The length of haul for OMNIPORT® rail shipments was an estimate from CMTS studies and the average cost was a 1987 average from ICC data (also escalated to 1989).

The truck inputs for both automobile and liquid bulk shipments were also based on escalated 1987 ATA averages (for motor vehicle and petroleum common carriers respectively). Automobile rail inputs were based on the 1987 ICC averages for motor vehicle movements.

The PEIK contains default values for direct port industry expenditures which were based on a 1982/1983 survey of the port industry. These values were utilized (projected to 1989 based on CPI growth for all costs except bunkers which utilized the petroleum producers price index for that period), except in the following cases:

- Navigation Services - Total 1989 navigation service costs of $955,000 were based on 1,374,000 revenue tons and an average cost estimate of $0.70 per revenue ton (from Economic Impact of the Port of Hueneme in Ventura County by Natelson-Levander-Whitney - November 1989). This value was utilized for all cargo types.

- Stevedoring/Cargo Handling and Terminal Charges - Unit cargo handling costs were previously estimated by LCC for automobiles, breakbulk and OMNIPORT® cargoes. The model's default value for liquid bulk handling was used.

- Wharfage - Current tariff values for wharfage were used based on representative commodities within each cargo type.

- Crew Expenditures - The NLW study estimated total 1989 crew expenditures of $167,000 based on 1,374,000 revenue tons. ($0.12 per RT). This value was utilized for all cargo types.

Local Port Users Inputs

As described previously, "local port users" include firms which utilize the port, but which are not directly involved in cargo transfer or handling activities. These industries include the offshore oil industry, ocean cargo processing (including automobile detailing and storage), and commercial and sport fishing (including processing) as defined in the NLW study. The

local employment estimates were based on survey figures developed in that study as follows (shown with appropriate industry sector):

	Employment	Industry Sector
Offshore Oil Industry		
Component Fabrication	119	Fabricated Metals
Other Products & Services	435	Wholesale Trade
Ocean Cargo Processing	193	Misc. Manufacturing
Commercial/Sport Fishing		
Fishing Activities	100	Agric. Svcs, Forestry & Fishing
Fish Processing	50	Food Products

In addition, "port user" employment was included for government employees not directly related to port revenues, including the U.S. Coast Guard and Immigration Service (3.1 jobs to "federal government" sector) and the County Fire Department and Department of Agriculture (2.3 jobs to "state and local government" sector).[2]

County and City Economic Inputs

Total personal income and earnings and local government revenues were developed from the 1988 County and City Data Book. Employment and earnings inputs by industry sector were estimated from various state publications. In both cases, the input data was adjusted to 1989 based on the growth in national personal income and earnings (farm and non-farm).

III. SUMMARY OF RESULTS

Exhibit 1 summarizes the direct, induced and total impact on Ventura County of 1989 port activity and projected OMNIPORT® new cargoes at full operation. As indicated, the port currently accounts for 2,107 jobs (1,464 direct and 643 induced) with 867 jobs related to port industry and 1,240 jobs in the "port user" sector. OMNIPORT® HUENEME is projected to increase this total by 2,329 jobs.

---

[2] U.S. Customs employment and income are included in the indirect impacts of port industry activity.

Total income to county employees is estimated at $32.8 million for current operations and $70.9 million with OMNIPORT® HUENEME. Total sales to county businesses for current operations amounted to $153.0 million with $71.5 million for port industries and $81.5 million for port users. The OMNIPORT® sales impact would be $188.5 million. The combined city and country tax impact is $5.9 million for current operations and $12.9 million with OMNIPORT® operations.

"A Lot of Ride for a Little Money."

June 26, 1990

Honorable Glenn Anderson
Chairman, House Committee
on Public Works and Transportation
2165 Rayburn House Office Building
Washington, D.C. 20515

Dear Congressman Anderson:

As mayor of the City of Oxnard and former Chairman of South Coast Area Transit (the bus compay that serves our city as well as four other cities in the western Ventura County Area), please consider our request for Federal Re-Authorization of Operating and Capital Assistance to public mass transit.

South Coast Area Transit with the acronym SCAT is the major transit operator in Ventura County. SCAT operates 30 buses has 76 employees and serves a population of over 300,000 residents. The geographic area served is over 80 square miles comprising the Cities of Ojai, Oxnard, Port Hueneme, Santa Paula, San Buenaventura and the unincorporated area between these cities in western Ventura County. The transit systems annual budget is approximately 5 million dollars of which 1.375 million dollars or approximately 32% comprises the Federal operating assistance under Section 9 of the Urban Mass Transportation Act. SCAT operates in the urbanized area of Oxnard-Ventura-Thousand Oaks, an urbanized area of over 200,000 and is the designated recipient for UMTA Section 9 for this urbanized area.

SCAT operates approximately 1 million miles each year and has a ridership of over 2 million of which approximately 3,000 rides are by wheelchair passengers. 21 buses out of SCAT's 30 bus fleet are equipped with wheelchair lifts and with all buses that are scheduled for replacement, the balance of the fleet should be totally accessible by 1994.

SCAT's most immediate concern is the continuance of Federal capital and operating assistance under the formula grant program which was established through the Surface Transportation Assistance Act. Initially, when this Federal provision was enacted, SCAT was eligible to receive 50% of its operating budget from Federal funds and there were ample Federal funds within the urbanized area to accomplish this. However, with the enactment of an operating cap in 1978/79, the agency was forestalled from utilizing more than 1.8 million dollars in Federal operating assistance. In addition, since that time, the effects of the Gramm-Rudman-Hollings Act has reduced the amount of funds SCAT is eligible to collect from

Federal operating assistance to 1.375 million dollars. This has placed a substantial burden on the agency at a point in time wherein mass transit is one of the prime alternatives to improve air quality and provide transportation mobility to the handicapped.

As a matter of fact, Congress has passed the Clean Air Act and has enacted the Americans with Disabilities Act (ADA) with no consideration for funding the transportation alternatives that these legislative enactments have mandated. It is most disturbing that the Bush-Quayle budget has targeted mass transit for either further reductions in funding assistance or elimination of funding altogether. The alternatives for funding mass transit at the local level are problematical, especially in dramatically growing areas such as Ventura County. The needs for suburban mobility, rural mobility and volume as well as disparity of the trip demands by residents are increasing at an exponential rate.

The Gold Coast, as we refer to it, is so because of the climate and opportunity that is found in few places around this nation. The Gold, in intrinsic terms, does not always come with population increases or transportation demands. The needs of the current long-term residents, the growth in their family units, the rapidly vanishing available real estate has meant growing density and demand for housing. This has presented monumental problems for local elected officials such as housing for the homeless, senior citizen programs, the provisions for adequate water supplies, waste management and hazardous waste disposal.

The plea for greater and continued mass transit support is one of major local policy effort. It is certainly one of national significance and most especially in areas of my constituents - those of Ventura County residents. We all look to your advocacy in continuing and increasing the Surface Transportation Assistance Act. This means the re-authorization at current or greater levels of support through financing operating and capital transit programs.

Sincerely,

Nao Takasugi

Mayor Nao Takasugi

NAO TAKASUGI
MAYOR

June 27, 1990

Mr. Roger Slagle
c/o Representative Glenn M. Anderson
300 Long Beach Blvd.
Long Beach, CA. 90801-2349

Dear Mr. Slagle

Oxnard is the largest city in Ventura County and one of the 25 largest cities in California. California is often viewed as a region singularly gifted in resources, with a balanced and diversified economy which ranks sixth worldwide. Due to the unique nature of our situation, comparison to, and competition with, other States for Federal funding becomes a complex equation.

Based on our economic stability, the availability of relatively inexpensive land and a diverse labor pool, we are in the unique position to take advantage of the coming explosion in Pacific Rim trade. The opportunities for economic prosperity are unlimited and, in Oxnard, these opportunities are best represented by the deep water Port of Hueneme. The Port of Hueneme Access Study recently prepared by a local Task Force, and endorsed by the Southern California Association of Governments (SCAG), recognizes the coming boom in Port trade and addresses the impacts that an increase in Port activity would have on the region.

The Task Force established to prepare the study was composed of representatives from both public and the private sector organizations concerned with the growth of the port, and the impact on the existing regional infrastructure. This group is a true public/private sector partnership. The Task Force determined that the key to maximizing the benefits of increased Port activity was to be prepared. A list of the necessary improvements was developed by the group and methods of funding the necessary improvements were identified. Potential funding sources included the Cities of Oxnard, Port Hueneme and Ventura, the County of Ventura, the Navy Installations of Point Mugu and the Navel Construction Battalion Center at Port Hueneme, the Ventura County Transportation Commission, Caltrans, and the Oxnard Harbor District (Port) as well as private sector organizations like the Auto Club, Southern Pacific Railroad, and others.

To: Mr. Roger Slagle
Subject: Testimony To The Subcommittee on Surface Transportation
June 27, 1990
Page Two

Currently, this coalition has $22 million in funded or committed dollars for the necessary improvements. We still have a significant shortfall in our total funding requirement of $84.4 million. We are united in identifying additional resources for our projects. One of the most viable options open to us is the pursuit of the passage of a half-cent sales tax earmarked for transportation improvements in Ventura County. This will insure that the County has the matching funds necessary to meet the State Proposition 111 requirements. We are hoping that this measure will meet with success in November.

Recognizing that new surface transportation legislation will soon be considered, the Task Force would like to recommend that funds be established for intermodal and port access projects. This is a logical connection with the traditional funding of highway improvements recognizing that our ports play a key role, through the distribution of goods and the creation of local jobs, which significantly enhances both the local and national economies. Ventura County and specifically, the Oxnard Plain is home to the Port of Hueneme. The Port is linked to the economies of California, the Nation, and the Pacific Rim, and is the vehicle through which we can maximize our international trade opportunities. The expansion of port activities, however, is dependant upon our ability to fund the required infrastructure improvements which will allow increased activities. Keeping these tangible benefits in mind, I would ask you to strongly consider our request for the inclusion of intermodal and port access project funding in the upcoming surface transportation legislation.

Sincerely,

Nao Takasugi
Mayor, City of Oxnard

City of Port Hueneme

ATT: Susan Lacey, Chairman

RE: Port of Hueneme Access Study

A Task Force comprised of representatives from both public and private organizations concerned about Port of Hueneme growth and the impacts of Port generated traffic, made a comprehensive study of various accesses to the Port of Hueneme, which included Victoria Avenue and Rice Avenue extensions to Port Hueneme Road.

The City of Port Hueneme supports the results of the study and recognizes that the cost of improving those routes is extensive. However, we believe there has been a strong local effort by all the communities involved to try to upgrade the routes within their respective jurisdictions.

In order to make both routes fully usable, it will take continued cooperation. Therefore, we respectfully request Federal participation in order to implement the improvements set forth in the Port of Hueneme Access Study.

Sincerely,

JOHN R. VELTHOEN
City Manager

RE: Funding for Public Mass Transit - In Support

Dear Congressman Anderson:

The Bush administration has targeted mass transit for another funding cut. During your committee's hearing, please continue your strong support for re-authorization of support for public mass transit at the current (higher, if possible) levels through financing both operating and capital programs.

This union is pleased to represent a small, but vital public bus transit company serving a population of over 300,000 residents. Many of the riders of this company are transit dependent. Without the bus service, the battle for good air quality and compliance with the Clean Air Act and the Americans with Disabilities Act (ADA) seems impossible.

Ridership is up. Studies show South Coast Area Transit to be effective and needed here, as in many communities. Without the special funding provided through mechanisms like the Surface Transportation Assistance Act, our members and our citizens will lose out to the other demands such as housing for the homeless, adequate water, waste management and disposal of toxic waste.

If we need to coax our citizens out of their automobiles we must provide the working class with working solutions. Public mass transit is about the only answer.

Page 2
June 25, 1990

Please place our letter in evidence as support for additional funding for public mass transit.

Yours very truly,

Barry L. Hammitt
Executive Director

The Honorable Norman Y. Mineta, Chair, Surface Transportation Committee

TESTIMONY BEFORE THE SUBCOMMITEE ON SURFACE TRANSPORTATION
HOUSE COMMITTEE ON PUBLIC WORKS & TRANSPORTATION

WILLIAM E. LEONARD
CHAIRMAN
CALIFORNIA TRANSPORTATION COMMISSION

FIELD HEARINGS:
REAUTHORIZATION OF POST-INTERSTATE SURFACE TRANSPORTATION PROGRAMS

JULY 2, 1990
10:00 A.M.

City Council Chambers
City Hall
333 West Ocean Blvd., 1st Floor
Long Beach, California 90802

Mr. Chairman and Members of the Subcommittee:

I am William E. Leonard of San Bernardino, Chairman of the California Transportation Commission.

Thank you for permitting me as Chairman of the California Transportation Commission to share with you some of my colleagues' and my thoughts on the future of the federal-state relationship as you consider the theme of these hearings: "Reauthorization of Post-Interstate Surface Transportation Programs." I am delighted to report that California's electorate, through passage of Propositions 108, 111 and 116 at the polls on June 5 have expressed their support for a modern, integrated, multi-modal transportation system.

The Commission's role in the development of transportation policy in California is one of establishing and organizing program priorities and allocating the resources to meet those priorities. This includes the allocation of available federal assistance to state transportation programs. In times when funding for transportation programs has been limited, ours has been a challenging responsibility. We are impressed that California's voters saw that challenge too and willingly accepted their responsibility to increase the user's share of expanding our state's transportation network and improving its capacity and efficiency. In addition to California voters accepting state responsibility, I am pleased to report that 17 counties, representing 74 percent of state's citizens, have also imposed added taxes to augment state and federal revenue designed to enhance transportation infrastructure.

In evolving a new federal - state relationship in the post-Interstate period, the Commission has adopted a set of principles it hopes will govern that relationship. Let me discuss some of them with you.

First, the Commission believes that new federal programs must recognize a federal role which emphasizes the effective functioning of a limited national system that supports national defense, encourages economic development and improves interstate mobility.

Second, the new federal program must allow states to define the authority and responsibilities of each level of government within the state and provide states the flexibility to determine their own transportation priorities when there is no overriding national priority. The Commission urges the Congress to grant to states with certified planning processes the flexibility to use federal highway and transit funds for the modal solution that best serves the needs of specific regions or communities within the state.

The Commission is very troubled by the growing trend toward federally supported transportation demonstration projects -- not only because they command an increasing share of limited available federal funding, but also they require increasing sums of state/local resources. In short, when federal funds are directed to constituent-specific projects, and a state or local match is required, these federal priorities tend to divert state and local resources from projects selected through the established state/local planning process. Increased flexibility in federally programmed transportation funds would reduce the need for demonstration projects which address needs not included in current programs. The test for future federal demonstration projects should be more severe, federal funding for demonstration projects should be over and above normal apportionments and allocations and if any non-federal match is to be required, it should come from the local benefitted community and not from state resources that should be devoted to statewide priorites and programs.

The post-Interstate federal programs must eliminate duplication of engineering and environmental review efforts and, most importantly, excessive federal mandates that have been exemplified so clearly by demonstration projects and by current project approval procedures. Restoration of state and local responsibility and authority, particularly in those states that have clearly demonstrated the capacity to exercise that authority must be a hallmark of the post-Interstate reauthorization legislation. The bottom line is that post-Interstate federal priorities and programs should not undercut or usurp state programs and priorities, but rather they should supplement and complement these state efforts. The Commission calls for increasing reliance on federal certification of state and local project approval procedures where those procedures are found to be reasonable surrogates for direct federal approval procedures. The acceptance of this principle would materially reduce the cost in time and money of all transportation projects without in any way reducing the purposes or objectives of the federal procedures being certified for delegation to the states.

This is particularly true as the new concepts of the Highway System of National Significance (HSNS) and Transit System of National Significance (TSNS) emerge. The Commission believes that if there is truly to be a Transit System of National Significance, its focus, particularly from the federal perspective, should be on interstate and

interregional movement, and in particular on high speed rail, which makes sense only for inter-urban travel. The French, Germans and Japanese clearly have shown the way; their national governments have encouraged the development of an innovative, modern rail passenger network that enjoys enthusiastic public support evidenced by increasing ridership and an ever expanding high speed rail network throughout these nations. An industrial nation of the importance of the United States can ill-afford to abandon rail passenger services. Californians are reawakening to the need to revive rail passenger service throughout urban California, with new light rail systems such as San Jose's Guadalupe and Tasman corridors, and with improved commuter and urban rail services such as BART extensions to San Francisco Airport and hopefully to San Jose. Four corridor studies are examining expanded service on inter-city routes including Los Angeles-Fresno-San Francisco, and San Jose-San Francisco-Sacramento-Auburn. The voters emphatic endorsement of both rail transportation bond measures on the June 5 California Primary Election ballot is clear evidence of increased public awareness of the value of improving and expanding effective and feasible rail passenger service both in California and throughout the nation. Congested metropolitan airports, and clogged access routes to those airdromes have increased public awareness that an effective high-speed rail network would provide Californians a viable alternative to short and medium distance air travel and provide needed healthy competition for short-haul air travel.

It is in the federal interest to better connect the regional urban centers in California, the Southwest and the Pacific Northwest, in order to promote interstate commerce and mobility and to enhance American competitiveness in the Pacific Rim. The Commission recommends that TSNS programs receive at least 50 percent of the federal funding available for transit, particularly if there is no increase in the levels of funding for federal programs, so that adequate funds may be targeted to high-speed rail deployment. In this connection, it is important that Congress consider allocating federal transit funding through the state, so that state standards regarding the efficiency and effectiveness of transit service, at whatever level, can be enforced and rewarded.

Federal funding should avoid "stacking the deck" in favor of one program or mode over another. Federal programs should not undercut the broad objective of neutralizing structural differences between programs and modes so that the best conceivable project solution is funded rather than the one that happens to fill the available federal funding category. Care should be taken in defining HSNS and TSNS, the federal definition of transit should be expanded to include HOV lanes and ridesharing programs, and it should be possible to use HSNS funds for transit or TSNS funds for highways. Let the states tailor the program to meet intrastate, statewide needs. In short, the new post-Interstate national concept for transportation must address transportation issues on the basis of an integrated multimodal system rather than as a group of competing modes, categories, projects and jurisdictions.

With respect to funding of post-Interstate federal transportation programs, the Commission believes that both HSNS and TSNS should be placed on an equal footing: funding should be by formula with as little discretionary involvement and judgment by the federal government as possible. Funding distribution could occur, at least in part, in a manner similar to California's new State-Local Partnership program in which state and local funding efforts would be rewarded with federal funding. Non-federal funding for maintenance as well as capital investment should also be recognized and rewarded. In any event, federal funding under such a scheme should not be on a project-by-project basis, but rather based on overall expenditures or categories of expenditures.

Let me address a matter of increasing concern to the Commission. In the on-going negotiations between the Congress and the Executive Branch concerning the federal Budget deficit, the Commission believes that federally imposed transportation taxes and user fees must be preserved solely for transportation purposes. The federal Highway Trust Fund should be taken out of calculations designed to mask the extent of the federal deficit.

In fact the "obscene" balances in the Highway Account and Aeronautics Account have been maintained for far too long to mask the true extent of the federal deficit. These funds must be released within prudent levels for the purposes that these user fees were collected. The Highway Trust Fund could easily handle not less than a $6 billion spend-down spread over a four-year period. California voters burdened themselves with increased fuel taxes and weight fees dedicated exclusively to transportation, with bond measured dedicated exclusively to transportation, and with sales tax increases dedicated exclusively to transportation. Therefore it is only reasonable for Californians to expect that federal transportation user fees must go to transportation and not to offset or retire deficits in the federal General Fund. It is time to put highway and aeronautics trust funds to work for the purposes for which they were collected.

The new post-Interstate program must guarantee the earliest possible release and availability for obligation of all federally imposed transportation excise taxes and fees to states and local entities and allow maximum flexibility with respect to the use of these transportation funds. The California Transportation Commission recently communicated with members of the California delegation in Congress its continuing concern for the willingness of some congressional leaders to consider making increases in the federal motor vehicle fuel tax a key element in any deficit reduction "package". California's voters want highway transportation taxes and user fees used for transportation system improvements, and maintenance, and for no other purposes. That is the clear lesson of the public's endorsement of Proposition 111 on June 5th.

Let me touch on one aspect of federal transportation policy that, to date, has received too little attention: the matter of overweight trucks. The federal government has both a responsibility and a role to play in increase enforcement of truck weight limits and penalties for infractions of those limits. This is especially true as the truck

industry considers the introduction of the so-called "truck train" -- a vehicular transportation device that well could threaten the very fabric of the paved highway system if not controlled. Continuing studies by California's Department of Transportation clearly demonstrate that overweight trucks damage public property and require higher levels of public investment for repair, thus competing for limited resources desperately needed for other transportation programs.

The federal government has a proprietary interest in protecting its very substantial investment in the Interstate Highway System which has a total cost to date of $134 billlion and has a current value of over $500 billion and the future Highway System of National Significance. The federal government is in a position to ensure uniform enforcement of truck weight limits in all states so that one state's responsiveness to this problem does not result in the liability of lost commerce and shipping activity to neighboring states that are less stringent in their monitoring of truck traffic and enforcement efforts.

Finally, I want to conclude with a special plea to you as congressional leaders in the transportation area to lend your support in the new era of post-Interstate federal programming to ensure enhanced federal support for research and development. This need cannot be stressed too much. Through greater public and private investment in research and development lays the key to our future mobility while at the same time enhancing safety, energy conservation and air quality. The Commissioners believe that California will compete quite successfully under a federal discretionary program for research and development aimed at our land grant colleges and universities. If this nation, as well as California, is to remain in the forefront of development of innovative transportation systems and mechanisms to reduce congestion and air pollution, it is imperative that we must maintain, if not increase, our investment in R&D. This commitment includes not only public sector R&D programs, but also considerable effort being made in the private sector. The University of California's Institute of Transportation Studies at Berkeley and at its Richmond field laboratories continues to make impressive contributions to engineering advances in improving this state's transportation network. We Californians think the Congress should have a similar objective at the national level.

In summary, let me say we support program flexibility by the states in the use of federal transportation funds, reliance on state and local project approval procedures, protection of user fees for the purposes for which they were collected, and increased research and development. Thank you for allowing me to share our views as to how California can best contribute to, and fit in with, the development of post-Interstate federal transportation programs and policies.

INTRODUCTION OF RICHARD SUENISHI BY CAROL MARGOLIS

ASSISTANT PROGRAM MANAGER, THE BETTY CLOONEY CENTER

BEFORE THE HOUSE PUBLIC WORKS AND TRANSPORTATION COMMITTEE

SURFACE TRANSPORTATION SUBCOMMITTEE FIELD HEARING

LONG BEACH CITY HALL -- LONG BEACH, CALIFORNIA

JULY 2, 1990

Hello, my name is Carol Margolis, and I am assistant program manager at the Betty Clooney Center, a treatment and rehabilitation facility for brain injured persons in Long Beach. We appreciate the opportunity to testify before you.

I am here to introduce Richard Suenishi, who attends the Clooney Center. Unfortunately, Richard is only one of many member/clients who are at our center because they were in motorcycle crashes and were not wearing helmets.

Richard wanted to speak to you today because it is our nation's highway safety laws which have the greatest influence on how many young men and women will suffer severe, life-long disability and will thus join Richard at facilities such as the Clooney Center because they did not wear motorcycle helmets.

Carol Margolis, Page Two

A recently released study by the San Francisco Injury Center indicates that helmet use is the single most important factor in preventing death and head injury in motorcycle crashes. The report concludes that the most effective method to prevent head injuries is to mandate helmet use by all motorcyclists.

If every California motorcyclist wore a helmet, as many as 160 lives would be saved annually, one thousand serious injuries would be prevented, and California could save an estimated 74 million dollars in medical costs, property loss and lost productivity.

In Richard's case alone, the medical and long-term care which he needs has cost his insurance company and U.S. taxpayers more than $1 million so far.

We at the Clooney Center hope not just for an all-rider helmet law for California, but for all states. Federal leadership is necessary if this hope is to be achieved. Mr. Chairman, as you and your committee write the new highway safety programs, Richard and I urge you to include strong provisions in support of helmet laws so that motorcyclists and their families around the country are spared the tragedy which Richard and so many others have endured.

Thank you very much. Richard --

TESTIMONY
OF

JAMES MARTENS
CHAIRMAN

CALIFORNIA HIGHWAY USERS CONFERENCE

TO THE
SUBCOMMITTEE ON SURFACE TRANSPORTATION
U.S. HOUSE OF REPRESENTATIVES

ON THE
REAUTHORIZATION OF THE POST-INTERSTATE
SURFACE TRANSPORTATION PROGRAMS

JULY 2, 1990

Mr. Chairman, my name is James Martens. I am Chairman of the California Highway Users Conference. I am very pleased to testify before the Committee today and am grateful that you are giving early attention to the critical issue of surface transportation legislation authorization.

The California Highway Users Conference is a state coalition of more than 80 California organizations dedicated to encouraging full development of highway transportation in the public interest. We are affiliated with the Washington D.C. - based Highway Users Federation, but remain autonomous from the national organization.

The California Highway Users Conference was very active in successfully supporting Proposition 111, which Californians approved June 5. As you know, this referendum will increase California's motor fuel tax from 9 cents a gallon to 18 cents a gallon. This increase will allow Californians to meet our future highway needs. The vote also proved that voters will approve sound highway user taxes when the money is to be spent for a clearly defined highway transportation purpose. People are willing to pay the taxes if they are sure it is to go for the purpose intended and they see a vital need.

But the approval of Proposition 111 fulfills only one-half of the requirements for Californians to be assured a sound transportation system. The other half of this state's highway picture is the federal highway program, which depends upon timely reauthorization of Federal legislation. Your committee's task is the shaping of legislation vital to this state and the entire nation's economic stability through the next quarter of a century.

I won't go over every detail of the future program, but allow me to point out our areas of general concern. I'll start by noting that we support the nine-point plan recommended by the Highway Users Federation. Some of the specific points we want the legislation to cover include:

The addressing of greater needs by providing increased resources

We support the Federation's proposal for a four-year reauthorization bill with annual funding for federal-aid highway and transit programs of $22.9 billion annually through 1991. In real dollar terms, the Federal government is spending 25 percent less on highways than it did in 1983, even though travel has increased 27 percent since then.

These reductions have allowed a surplus to build within the Federal Highway Trust Fund. Today, that surplus stands at $17.28 billion. Highway users share the national concern over federal budget deficits and are willing to share in reasonable efforts to bring the deficit under control. But any decision to artificially constrain highway spending to create a deficit masking surplus in the Highway Trust Fund clearly has an undesirable impact on the domestic economy.

Mr. Chairman, we applaud your efforts in sponsoring House Resolution 41, which clearly indicated the opposition of the House of Representatives to using a motor fuel tax for deficit reduction.

The distribution of funds based on a formula basis

A major strength of the Federal program is that it has been based on an equitable distribution system that insures that even smaller states are able to construct an adequate highway

network. The Conference urges, however, that donee states such as California have their guaranteed return increased from 85 percent to 90 percent.

Keeping transportation decisions closer to home

In the post-Interstate construction era, federal highway dollars will be needed to maintain the system and to make highway improvements in metro and rural areas that were either passed over, or unanticipated, during the Interstate era. Decisions on these types of projects are more appropriately made closer to home. The Conference supports increased flexibility for states in using funds under many of the program's classifications. This flexibility is particularly important in program elements such as the $4 billion a year metropolitan transportation category proposed as part of the Highway Users Federation plan. The bill should also insure that projects be funded upon the basis of priorities set at the state and local level.

A future bill consistent with Clean Air goals

The transportation sector has a tremendous responsibility to minimize travel-related pollution. Clean air and a sound transportation policy allowing sufficient mobility to grow as a nation are not mutually exclusive. In fact, they are mutually reinforcing. By reducing congestion by freeing traffic flow, highway improvements can significantly improve air quality.

Mass transit being part of the solution

We support increased spending on mass transit. In large urban areas, its use is part of the transportation solution. In fact, the Conference believes that metropolitan areas should be able to choose to spend some of their Federal Highway Trust Fund dollars on either highways or mass transit. In addition, the legislation should earmark $3 billion annually out of the general fund for mass transit.

Increased funding for research and development

Increasing highway capacity is only part of the solution to traffic congestion. Increasingly, we will need to learn how to gain the maximum efficiency out of our highways. We will have to augment traffic capacity through the use of new technologies which allow the road system to be used more efficiently and make it safer for all drivers.

The Conference recommends a program which will fund a public/private development of various smart car/smart highway technologies.

Timely passage of reauthorization legislation

We all learned from the six-month delay in the Federal highway program in 1986-1987. The transportation community has worked since then to form a consensus on key issues, to assist the legislative process. We realize that Congress has many other issues besides transportation to consider, so we believe it is critical that the subcommittee prepares legislation in a timely fashion.

The sooner legislation reaches Congress, the greater chance we have of passage of an excellent bill and of avoiding delays in the program. We should not risk the delay of badly needed highway projects because of late approval of the bill.

Mr. Chairman, the Conference believes that we won a major victory on June 5 when Californians agreed to pay for badly needed highway improvements. But we've yet won only half the battle. If Californians are to enjoy freedom of mobility well into the next century, we must have Congress approve a far-sighted rebate of the federal highway program. We do not underestimate the difficulty of the task your committee faces, but the Conference puts confidence in your leadership and this committee's ability to craft excellent legislation and then to insure that it receives timely Congressional consideration.

Mr Chairman, we appreciate this opportunity to review the Conference's proposal with you and would be pleased to answer any questions you might have.

Testimony by

George M. Medak
Chairman, Board of Directors
Long Beach Transit

and

Laurence W. Jackson
President and General Manager
Long Beach Transit

Reauthorization of the Surface Transportation Act
Public Hearing
Long Beach, California
July 2, 1990

Long Beach Transit
1300 Gardenia Ave.
Long Beach, CA 90813

Good morning Mr. Chairman and members of the Committee. My name is George Medak, and I am Chairman of the Board of Directors at Long Beach Transit. I would also like to introduce Larry Jackson, President and General Manager of Long Beach Transit. Our Company provides public transportation in the City of Long Beach and 9 other communities nearby. We have a fleet of almost 200 buses and carry more than 21 million passengers each year.

We greatly appreciate the opportunity to speak to you today regarding the Surface Transportation Authorization Act of 1991. Many changes are taking place in Long Beach and the surrounding area. With continued Federal support, Long Beach Transit will be better prepared to play a leading role in our local transportation system.

Long Beach Service Needs

First, we would like to discuss Long Beach Transit's plans for meeting future service needs. Long Beach Transit ridership has been growing steadily. Since the beginning of Federal operating subsidies approximately 15 years ago, our ridership has doubled. Recently, ridership has been growing fast at an annual rate of about 7%. Many of these new riders are making work related commute trips.

Some of the reasons for this heightened transit usage are the result of increases in population, as well as increased population densities from redevelopment. Also, there has been a significant shift in demographics with the huge influx of persons from Southeast Asia.

Further growth on a large scale is predicted for our service area. This will mean a considerable increase in the the number of person-trips. We can not afford the private automobile any longer. We have little room to build more freeways or to keep adding parking structures. Without a good public transit system, the result is a stagnating local economy due to the inability to move people and goods. Without a good public transit system, we will be endangering the health of our citizens from poor air quality. The People of California are beginning to realize transit can help clean our air, reduce traffic congestion, conserve energy and maintain a sound base for our economy.

Long Beach Transportation Study

Population, employment and traffic congestion in Long Beach are going to increase dramatically in the next 10 years. Employment city-wide will be increasing nearly 50%. Employment and traffic in downtown Long Beach are predicted to increase over 170% in the next 20 years. (See Growth Chart).

The chart before you graphically depicts the magnitude of the growth we are talking about. If Long Beach Transit is to merely maintain its current percentage of person-trips carried within the City, there will be a need for us to operate twice as many buses as we do today. However, maintaining our current share of person-trips will not be good enough in the future if we are to make a positive impact on our environment.

Regional Mobility

The Southern California Association of Governments is the regional planning agency for Los Angeles and surrounding Counties. They have analyzed growth in our area and developed plans that have the potential to reduce air pollution, minimize traffic congestion, and manage that growth. If nothing is done to decrease the reliance on the automobile, by 2010 there will be an average speed of 19 miles per hour on our freeways and surface streets. The Regional Mobility Plan that has been developed has set a goal of recapturing and retaining the transportation mobility level of 1984. A major component of the Plan is an increased reliance on public transit. If transit ridership can be increased from roughly 6 1/2% to 19%, this goal can be achieved. (See Predicted Conditions Chart).

This chart shows existing and predicted traffic conditions both with and without successful implementation of the Regional Mobility Plan. With the Plan, hours of delay can be held to less than 900,000 per year. Without the Plan hours of delay swell to over 10 million.

Light Rail and Metro Rail

With Federal participation, Southern California will be able to make a commitment to provide quality transportation alternatives. One giant step in that direction is the partnership with the Federal government in building the Los Angeles Metro Rail.

In less than 2 weeks the Los Angeles to Long Beach Light Rail Line is scheduled to open. This line is the first of 150 miles of Light Rail network planned for the County. The return of clean, comfortable and efficient passenger rail will cause an even greater awareness and acceptance of public transit as it has in other cities across the country.

Long Beach Transit will play an important complimentary role by collecting passengers and taking them to the stations, as well as transporting them to their ultimate destinations. Part of the success of the Light Rail System will depend heavily on the quality of the connecting bus service. Long Beach Transit intends to be prepared to increase the frequency of connecting bus service as demand requires.

When considering the reauthorization of the Surface Transportation Act, please keep in mind additional funding will be necessary to put additional buses on the street.

Clean Air Act

Recent legislation such as the Clean Air Act has the potential of putting tremendous demands on the scarce dollars we have available to provide transit service.

Long Beach Transit fully supports the intent of the Clean Air Act. By giving drivers alternatives to the single occupant automobile, transit is one way the goals of this legislation can be realized. However, costly and unproven engine technologies mandated for our Nation's bus fleets could produce the opposite results. With no additional funding assistance, service cuts needed to pay for implementing and sustaining alternate fuel requirements, will result in more cars on the road and more pollution in the air.

Clean diesel technology, as provided for in the House version of the Bill, appears to be our best option. Other alternative fuels tested produce little improvement in emissions over clean diesel, yet carry an extremely high price tag. A gallon of Methanol, for example, costs roughly twice that of diesel and will power a bus half the distance. In addition, there are significant costs associated with building and maintaining fueling facilities.

The cost in LA County has been estimated at $55 million to retrofit our fleets with clean diesel technology. With Methanol, the cost would be $200 million to build fueling facilities and another additional $60 million per year in higher fuel costs.

We urge you to work towards implementing the House version of the Bill. When considering the reauthorization of the Surface Transportation Act, we urge you to provide the funds necessary to implement the requirements of the Act and work with the Appropriation Committee to ensure authorized funds are appropriated.

Americans with Disabilities Act

The last comments we would like to make Mr. Chairman, are regarding the impact of the Americans with Disability Act on Long Beach Transit. Long Beach Transit strongly supports the accessibility of public transit by persons in wheelchairs and those unable to use regular fixed route service. Recognizing the need to serve persons with disabilities, Long Beach Transit was one of the first public transit companies in the nation to establish a demand responsive paratransit service. We began purchasing wheelchair lift equipped buses nearly 10 years ago and will soon have 100% of our fleet accessible to people in wheelchairs.

Long Beach Transit supports the goals of the Bill. The House-passed version of the Bill calls for more realistic requirements in combining the needs of persons with disabilities with the needs of the community as a whole.

However, without additional funding necessary to implement the Act, we will be required to cut fixed route service to pay for expanded paratransit. The total amount of fixed route service reallocated to paratransit may be significant. The most extreme scenario calls for an elimination of one-third of our fixed route service to pay for all the provisions of the Bill. The Southern California Rapid Transit District has estimated that cost to be one-half of their fixed route service.

Los Angeles County and Long Beach Transit in particular, have been leaders in supplemental paratransit and the accessibility of fixed route services. People with disabilities in Los Angeles County currently enjoy a level of service on both paratransit and accessible fixed route that is unparalleled in the nation. Paratransit offered by municipalities, social service agencies and others reach throughout Los Angeles County. Further coordination of paratransit service agencies may be all that is necessary to achieve many of the goals of the Act.

Conclusion

Mr. Chairman, we trust that your Committee will take the increased costs of the Clean Air mandates and the Americans with Disabilities Act mandates into account when reauthorizing the Surface Transportation Assistance Act. We as transit operators can not meet the demands of our growing community, of cleaning our air, and of expanding much needed service to disabled persons of our community without continued Federal participation.

Long Beach and the overall Southern California economy is critical to the National economy. Increased use of and investment in transit can help keep Southern California from choking on its own success. We are poised to meet those challenges and can greatly expand our transit system if a funding partnership can be forged.

We thank you again for the opportunity to discuss Long Beach Transit's views about our local transportation outlook, and how these concerns can be addressed within the Reauthorization Bill. We will be happy to answer any questions that you may have at this time.

July 2, 1990

Mr. Chairman and committee members

My name is Barbara Messina, Mayor of the City of Alhambra;

Thank you for the opportunity to speak today on a matter of great concern to our City----THE COMPLETION OF THE LONG BEACH FREEWAY GAP.

Alhambra, together with 11 other neighboring cities representing over 3.8 million people, have adopted resolutions in support of the completion of the Long Beach Freeway extension, between the San Bernardino Freeway and the Foothill Freeway. Caltrans and FHWA are currently reviewing the latest route proposal, and they are expected to reach a decision soon. We are asking the Committee to designate the extension of the Long Beach freeway as a priority primary project under the Federal Interstate Program.

The Long Beach Freeway gap closure proposal has been the subject of study for almost thirty years. Since 1963, twenty-four alternative routes have been studied to complete the project with Interstate 210 in Pasadena. Over the years, there have been numerous designs proposed by Caltrans and others for the completion of the six mile gap in the freeway. The focus of this attention is a 6.2 mile gap in the 75 mile freeway system which rings the Los Angeles Central Business District.

Some individuals claim that closing the freeway gap may actually exacerbate traffic problems by generating new traffic, but they are not persuasive. New highways may generate more traffic in still-developing areas, but there is not much room for new growth around the freeway gap. In fact, an analysis by the Southern California Association of Governments suggests that closing the gap will simply relieve congestion that already exists, primarily on the surface streets were traffic from the unfinished freeway currently winds up. Cars moving along a highway generate less air pollution than they do in stop-and-go traffic.

Completing the freeway is necessary for both local and regional traffic, relieving local traffic congestion and providing better access to Long Beach Harbor.

The six mile completion of the Long Beach Freeway was designated as a priority primary route under the Federal Interstate System in the 1987 Highway Bill. As the Surface Transportation Subcommittee considers the highway bill, we would ask that the Subcommittee request priority primary funding in the 1991 Highway Reauthorization Bill for this project. The City of Alhambra would like to work with the Public Works Committee to ensure that funding is authorized for this vital freeway project.

This ring of freeways was primarily conceived in the late 1950's, as part of the master plan for the primary central metropolitan Los Angeles area freeway network. This Construction began in the early 1960s and by 1976, approximately 71 miles, or about 97 percent, of the system was fully operational. Closing the remaining gap would have the effect of fully connecting the Long Beach Freeway with nine other freeways between the cities of Long Beach and Pasadena.

Alhambra has long been among the leading proponents of completing the gap in the Long Beach Freeway, which now empties onto Valley Boulevard in Alhambra, creating heavy congestion on many of the city's streets.

Commuter and truck traffic driving between the Long Beach and Pasadena areas, and points in between, must use surface streets between Alhambra and Pasadena because of the missing six mile section of the Long Beach Freeway. These surface streets were never meant to carry this extraordinarily high volume of traffic. The result has been a tremendous degree of ever worsening traffic congestion on all north/south streets within three miles of the proposed route of the freeway link which becomes chaotic during peak commuting hours.

By completing the extension of the Long Beach Freeway, Caltrans projects that we put between 150,000 and 200,000 cars on the freeway that are now on local surface streets. Without the freeway, traffic on Alhambra's Atlantic Boulevard is expected to jump from 55,000 cars daily today to 73,000 by the year 2000.

In addressing this issue, it is important to distinguish between current traffic volume levels, and traffic demand levels. For example, if one views the traffic counts for Fremont Avenue over the last several years, they have gone up an average of two percent per year, which is seemingly manageable. However, what is not reflected in these counts is the fact that traffic volumes on Fremont Avenue are, and have been, above the rated capacity of the street for over ten years. As a result, commuters, frustrated by having to wait through multiple signal changes at virtually every intersection on Fremont, have moved to the east and onto residential streets to find faster, even though longer, routes through Alhambra to Pasadena or the Foothill Freeway to the north. As a result, traffic volumes on Atlantic and Garfield, the two major north/south arterials to the immediate east of Fremont Avenue, have increased at some locations by over four percent per year, or twice the rate as on Fremont.

Traffic on these two streets is now in excess of capacity and growing numbers of commuters are now winding their way through

the residential streets of Alhambra, rather than endure the congestion of the arterials. This is evidenced by the growing number of requests from Alhambra residents for speed bumps and stop signs to deal with the ever increasing traffic.

In short, the traffic demand is increasing dramatically each year, but it is not fully reflected in the traffic counts on the major streets, because more and more commuter traffic is finding its way onto residential streets. The Long Beach Freeway extension would remove some of the demand from the adjacent arterial network and thereby significantly improve conditions on those roads.

The freeway extension would relieve congestion and increase safety on local streets in the area of the freeway. Accidents are a function of the number of potential conflicts for vehicles and pedestrians. Reducing traffic speed correlates with a reduction of traffic accidents, but conflicts with the goal of reducing delay. One of the best ways to reduce accidents on a road is to reduce the traffic on it. If the traffic is transferred to a freeway, both the accident rate and the delay would improve, because freeways are inherently safer and faster than arterial roads, due to the reduced conflicts. In particular, streets that would be greatly benefited are Valley Boulevard in Los Angeles and Alhambra; Fremont Avenue in Alhambra

Some individuals claim that closing the freeway gap may actually exacerbate traffic problems by generating new traffic, but they are not persuasive. New highways may generate more traffic in still-developing areas, but there is not much room for new growth around the freeway gap. In fact, an analysis by the Southern California Association of Governments suggests that closing the gap will simply relieve congestion that already exists, primarily on the surface streets were traffic from the unfinished freeway currently winds up. Cars moving along a highway generate less air pollution than they do in stop-and-go traffic.

Completing the freeway is necessary for both local and regional traffic, relieving local traffic congestion and providing better access to Long Beach Harbor.

The six mile completion of the Long Beach Freeway was designated as a priority primary route under the Federal Interstate System in the 1987 Highway Bill. As the Surface Transportation Subcommittee considers the highway bill, we would ask that the Subcommittee request priority primary funding in the 1991 Highway Reauthorization Bill for this project. The City of Alhambra would like to work with the Public Works Committee to ensure that funding is authorized for this vital freeway project.

Statement by Nick Patsaouras, Board President of the Southern California Rapid Transit District before the Subcommittee on Surface Transportation of the Committee on Public Works & Transportation of the United States House of Representatives, July 2, 1990

Chairman Anderson, Chairman Mineta, Members of the Subcommittee, I want to thank you for this opportunity to present the Southern California Rapid Transit District's (SCRTD's) views on reauthorization of the Surface Transportation Assistance Act and, particularly, for coming to Los Angeles to see, first hand, the transportation needs of our metropolitan area.

We at the SCRTD are proud of the progress we have made in meeting these needs. We realize that there is much that remains to be done if our region is to meet the transportation challenges of the '90s and into the next century.

The Southern California region is currently faced with tremendous unmet demands for transit service, as well as future demands that are staggering. California voters recently indicated their support for transportation by passing a comprehensive financing package which included funds for streets and roads, rail transit and other demand management improvements. However, the revenues created do not address the overwhelming need for rail and bus operating funds, as well as the additional capital funding that will be needed to expand the bus fleet.

I will briefly review the factors that are generating the tremendous current and future demand for transit in the region. These demands include:

- Population growth and a flourishing economy that continues to increase congestion in the area,
- The imposition of stringent Clean Air requirements,
- An increasing emphasis by employers to encourage employees to utilize mass transit,
- A growing elderly population that tends to be more transit-dependent, and
- The mainstreaming of a growing number of disabled persons, who are increasingly relying on public transit.

The Southern California region is currently the most underserved transit market in the country. SCRTD ridership is third highest in the country, right behind Chicago. I would like to refer the members to the attached tables. Tables A and B clearly demonstrate transit's vital role in an area where "the car is king." RTD buses work longer and harder than any other American city. The addition of Light Rail in just a few weeks will further assist in meeting Los Angeles County's transportation needs. However, the added rail lines in the County will still only address a portion of the growing demand.

In Los Angeles, our local Air Quality Management District has imposed sweeping air quality reforms, in conformance with EPA requirements. These measures increase the transit mode split for workers in Los Angeles County from 9 percent to 25 percent by the year 2010. In order to meet this requirement, transit services will need to be tripled. We estimate that about two-thirds of the additional service will be provided by bus transit, presuming construction of all rail lines planned for implementation by 2010. This will require an increase in the active bus fleet from nearly 2000 buses to almost 5000 buses. Based upon these requirements, the total unfunded operating and capital needs over the next twenty years is estimated to be $11.2 billion for SCRTD's service area.

Further, Congress is poised to enact within the next few weeks legislation that will materially add to the burdens and responsibilities of transit districts throughout the nation. We speak, of course, of the Clean Air Act, now in conference between the House and Senate, and the Americans With Disabilities Act which may soon find its way to the President's desk.

The SCRTD is committed to meeting these new responsibilities. We are in the forefront of those transit districts that are testing alternatively fueled vehicles. The District is currently testing over 40 alternatively fueled vehicles including the largest methanol and compressed natural gas fleets in the nation. By the end of this year, we will be testing over 60 clean fuel vehicles. We have also implemented a very successful program to increase the mobility of the disabled. Currently, over 90 percent of the District's fleet of 2300 vehicles is lift-equipped. We will be 100 percent lift-equipped by 1994.

Recently, SCRTD representatives met with top UMTA officials to explore the concept of expanding the existing federal transit program to address the funding requirements of these two major pieces of legislation. UMTA supported the District's efforts to canvass other large metropolitan transit districts to determine the impact of this legislation on their properties.

The SCRTD convened a meeting in Washington with eight of the largest transit districts in the nation. We shared with our colleagues the cost figures accumulated by the SCRTD in meeting the strictures of the California clean air requirements which, in large measure, coincide with those that will most likely emerge from the House-Senate conference. Attached to our testimony (Table C) is a footnoted chart delineating the costs of clean emissions. Mr. Alan Pegg, General Manager of Southern California Rapid Transit District, will be pleased to provide for the hearing record a full explanation of these costs.

38-258 O—91——78

We have asked transit districts to compile similar statistics that will reflect their projected costs in meeting clean air requirements so that you will have a fair estimate as to those incremental costs. As you know, there is precedent for the principle of having the federal government assist in meeting environmental costs mandated by federal law. One need look no further than the Clean Water Act which has made some $55 billion in construction grants to state and local entities since 1972.

You should be aware too, Mr. Chairman, as you continue your hearings throughout the country, that transit districts will be compiling their projected costs of meeting those capital and operating requirements anticipated by the passage of the Americans With Disabilities Act. Once again, California is proud to have anticipated the national will in this regard.

Overall, we cannot overemphasize the importance of Section 9 operating funds and Section 3 capital funds. As you are well aware, the Administration is proposing drastic cuts in these vital programs. These proposed Section 9 cuts would amount to a $1 billion shortfall for SCRTD over the next 20 years. Currently, SCRTD receives about $41 million, or seven percent of annual operating assistance from Section 9. Loss of these funds would translate into a 23 percent fare increase or a 10 percent service reduction.

Table D illustrates the direct correlation between transit subsidies and ridership. These subsidies only enhance the District's 43 percent farebox recovery ratio.

We recognize that some of these problems are peculiar to the Southern California region. But in many cases California is a trend setter, and leads the nation in issues that soon will affect the rest of the nation. It is time to address these needs now.

Therefore, I respectfully request the Committee to consider the following, when deliberating on the reauthorization:

- Maintain current capital and operating assistance programs;
- Consider a specific line item to fund the incremental costs associated with implementing the provisions of the Clean Air and Americans with Disabilities Acts;
- Consider recommending a 7 cent federal gas tax increase for transit purposes; and
- Mandate the expenditure of the $3.9 billion in unobligated balance that currently exist in the Transit Account of the Highway Trust Fund.

Mr. Chairman, we do not apologize for asking for this assistance. Facing these demands head-on is critical to the economic vitality and competitiveness of this country, just as the need for highways was critical to the nation's growth and vitality in the 1950's and 1960's.

We applaud you, Chairman Anderson, Chairman Mineta, and other members of the Committee for your dedication to improving the mobility of our great country. Through a cooperative federal, state, local and private partnership we can meet the present and future needs of our economically vital and dynamic nation.

NEIL PETERSON, EXECUTIVE DIRECTOR
LOS ANGELES COUNTY TRANSPORTATION COMMISSION
TESTIMONY BEFORE
THE HOUSE SUBCOMMITTEE ON SURFACE TRANSPORTATION, COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION, REAUTHORIZATION OF THE POST-INTERSTATE SURFACE TRANSPORTATION PROGRAMS
JULY 2, 1990, LONG BEACH CITY HALL

Chairman Anderson
Chairman Mineta
Members of the Committee

Cong. Hastert
Cong. Packard

My name is Neil Peterson, Executive Director of the Los Angeles County Transportation Commission. I appreciate this opportunity to testify on the reauthorization of the Surface Transportation Act.

With the completion of the Interstate program, a chapter has closed and there is a new era before us with a strong opportunity to address the nation's transportation needs. The support your committee has shown for transportation issues is widely recognized across the nation, however, your active leadership will be necessary over the coming months if we are to craft legislation which solves the growing transportation and mobility needs.

A CRISIS IN TRANSPORTATION TODAY

Locally, the average speed on our freeways is 35 mph and will be 17 mph in ten years. Even with our ambitious rail construction schedule, the demand for additional capacity is growing. In fact, congestion will increase by 50% due to the additional residents moving to Los Angeles County within the next 20 years.

Experts have estimated that we are losing $507 million each year in lost productivity time due to our inability to move people on our transportation system. In addition, we have the worst pollution problem in the nation and vehicle emissions represent about 50% of the problem. The federal and local mandates associated with improving air quality will have a significant cost impact (estimated at $6 billion) to our economy and it is presently unfunded. Federal transit support has been cut 50% in the last nine years. Based upon current appropriations, operators will need to cut 25% of the bus fleet (or 800 buses) unless funding is increased.

HOW TO DEAL WITH THE TRANSPORTATION CRISIS

Over the last year, I have spent a significant amount of time talking with transportation policy makers and transit operators across the nation. I am currently the chairman of a subcommittee addressing reauthorization issues for the transit industry [American Public Transit Association]. How the federal government takes a leadership role to respond to these issues will make a difference to:

a) our nations economy
b) its economic health
c) cleaning up our air; and
d) ensuring a high quality of life for all segments of our population.

I believe the following captures the basic principles the Committee should consider when deliberating on reauthorization legislation:

First and most importantly, there is no substitute for a federal role in funding transportation needs. Future transit and highway needs require a comprehensive financial strategy guided by increased federal involvement. Federal involvement is the key to achieving national goals and ensuring participation from all state and local governments. It is also needed to compensate for federal policies that have discouraged transit use and federal mandates that impose additional costs on transit systems at the local level.

The California vote for Propositions 108 & 111 show that residents understand the needs for increased mobility. Even with Los Angeles County residents willingness to tax themselves for transit and rail development, there is insufficient resources to address the issues I outlined above.

For these reasons, a federal gas increase is urgently needed. The American Public Transportation Association (APTA) calls for an $11 billion transit program and a seven cent increase in federal gas tax earmarked for transit. These monies would be spent to implement the Clean Air and Americans with Disabilities mandates as well as address deferred maintenance issues and capacity expansion.

To some critics, such a program seems ambitious, however, I ask that you look to our Canadian, European and Far Eastern brothers who have taken strong leadership positions and tackled these issues successfully. As a result, their need to rely on foreign oil has lessened. For example, the number of person trips using other than auto is the worst in the U.S. when compared to Canada, Far Eastern countries and Europe. Transit is one of the ways to increase our nations infrastructure capacity, reduce congestion, pollution and enhance mobility.

Second, the gas tax increase called for above should be enacted to support needed transit and highway investment, and the entire federal fuels tax made permanent concurrent with reauthorization of the surface transportation assistance act. Full revenues from the tax should be committed annually.

Third, the concept of transit should be broadened to include all high-occupancy, shared-ride services. The goals of federal policy should be to serve diverse travel needs, to reduce growth in vehicle mile traveled (VMT) while accommodating increased passenger miles of travel, and to serve people rather than vehicles.

Fourth, the federal tax code should be revised to promote private investment in transit, and to eliminate the taxation of employer transit subsidies and other disincentives to transit use.

Fifth, federal transportation policies and programs should require closer integration of transportation investments and land use decisions, to provide a favorable environment for increased use of high-occupancy, shared-ride services. Other federal policies should incorporate the same objectives. Unless local development practices and policies are consistent with basic federal transportation goals, direct federal investment will be ineffective.

Sixth, federal support should be more reliable and predictable. This can be accomplished through greater reliance on dedicated funding sources, formula allocation, and multi-year federal funding commitments. The costs associated with mandated federal actions, and transit's substantial contributions to the achievement of other national goals, justify increased support from all sources.

Seventh, expand federal support for transit research, development and training and ensure adequate direction of the program by transit industry officials.

Eighth, federal operating assistance for all sizes of transit systems is essential to assure adequate maintenance and effective operation of the transit capital investment.

Lastly, metropolitan areas should have greater flexibility in the use of transportation funds. Regional decision-making authority over the use of federal transportation funds should be enhanced and strengthened. Local areas should be able to deploy resources to meet regional goals in a way that is consistent with national policy. There should be a stronger multi-modal approach to planning, funding, and decision-making. This will enable local areas to make appropriate trade-offs among many local and regional objectives, to make more cost-effective use of resources, and to reduce counterproductive federal restrictions.

In summary, Honorable Chairman, your committee can take a strong leadership role to revitalize our nation's transportation system and ensure mobility by emphasizing the movement of people and goods. The alternative is gridlock, worsening air quality and segments of our citizenry who are locked at home.

Thank you for allowing me to speak on this vital issue. I would be happy to answer any questions.

Long Beach, CA 90815-0857
TEL: (213) 421-7420
FAX: (213) 391-9764

Introduction:

Chairman Anderson and Members of the subcommitte, I am Donald Prescott, Plant Superintendent, Facilities Operations of McDonnell Douglas Corporation, Douglas Aircraft Company. I am also the chairman of the Board of Directors of the Long Beach Airport Area Traffic Reduction Association (LBA^{2}TRA). On behalf of the Association, I thank you for the opportunity to address the Committee on the reauthorization of the federal surface transportation program.

I recognize that the Committee has traveled a great distance to receive testimony from a number of individuals and organizations. I will, therefore, be concise concerning my purpose before you today. However, I would be remiss if I didn't recognize and welcome Congressman Anderson who has been extremely helpful and sympathetic to past and current transportation needs in the Long Beach area.

Currently, the Long Beach Airport Area Traffic Reduction Association is working toward solving the increasing transportation needs in and around the Long Beach Airport. Founded in 1989, the Association is a non-profit association of employers and commercial property owners located at or near the Long Beach Airport.

The Association is actively pursuing a comprehensive program of transportation demand management strategies which will require a considerable amount of marketing and pursuasion of employers and their employees to change existing commuting habits. We are making a considerable commitment in this regard and will continue to shoulder these kinds of responsibilities. The many commute alternatives which the Association advocates, including car and vanpooling, alternative work schedules, telecommuting, and public transit, will help achieve both our transportation and air quality objectives.

We believe that in the post-interstate era, federal surface transportation programs for urban/suburban mobility and intermodal access should be on a par with preserving the integrity of the nation's Interstate System. The economic health, vitality and competitiveness of our nation is being threatened by increasing congestion and failure to meet the access needs of critical intermodal facilities. Typically, as is the case of here in Long Beach, these facilities can have significant negative impacts on daily commuters, our neighbors, our businesses as well as use of the intermodal facilities themselves. To maintain the nation's economic competitiveness, we need a national transportation program that recognizes and funds urban/suburban mobility programs and intermodal access.

In the Long Beach area, we are blessed with two siginificant port facilities, namely, the Port of Long Beach and the Long Beach Airport. At the airport, we are concerned about ensuring good access. To this end, the association's members have entered into a partnership with the City of Long Beach to develop and help fund a program of surface transportation improvements which will reduce peak period congestion in the area and ensure continued ease of access to the airport.

To date, our members have committed over $7 million to help finance these improvements in the vicinity of the airport. At the same time, a number of airport related highway projects remain beyond the ability of the private sector or for that matter, the City of Long Beach, to fund. Considering the commitment by the City of Long Beach and the recent significant private sector participation in improving access in and about the Long Beach Airport area, we strongly believe that the Congress and the Administration should be more active in finding solutions to congestion and access needs related to ports located in urbanized areas. We recommend that the Committee seriously consider providing significant increases to urban surface transportation programs or new program initiatives so that port access and port-related congestion problems can be adequately addressed.

We appreciate the Committee's past support and look forward to working closely with you on forging a new federal transportation program. I would be happy to answer any questions the Committee may have.

STATEMENT OF PAUL PRICE

NORTH COUNTY TRANSIT DISTRICT
NORTH SAN DIEGO COUNTY TRANSIT DEVELOPMENT BOARD

June 27, 1990

Honorable Congressman Glenn M. Anderson
The Subcommittee on Surface Transportation
U.S. House of Representatives
Room 2166, Rayburn House Office Building
Washington, D. C. 20615

Dear Congressman Anderson, Honorable Members of the Subcommittee:

Thank you for allowing me the opportunity to testify today on behalf of public transportation in the San Diego County area. Let me take a few moments to underscore the degree to which the San Diego region and the State of California has acted to improve public transportation without significant federal involvement. In fact, the efforts made in San Diego County were made despite significant federal reductions over the past ten years.

Locally, the region has taken initiatives in a very rapidly growing area of the country to look beyond our current funding shortfall and growing transportation gridlock, to not only plan, but begin implementing one of the best and most cost effective new public transportation programs in the nation. For example, in 1980, federal funding provided 20.8% of North County Transit District's operating cost for an estimated 7 million riders. In 1990, federal operating revenue amounted to only 11.9% of the cost for ten million riders. To show the degree to which the public and voters believe that we are in a transportation crisis, the voters in San Diego County, in November of 1987, voted to tax themselves at a rate of 1/2 of 1% towards the State sales tax for transportation. These monies were divided up for transit, highways and local street and roads projects. Then, again in June of 1990, the voters of the State of California passed Propositions 108, 111 and 116, which will double the gasoline tax in the State of California over the next five years to pay for significant rail transit and highway projects. Yet, this massive infusion on the State and local front has been met with reductions on the federal level, as can be seen from the tables and figures on pages 2 and 3. The San Diego region's unmet public transit needs over the next 20 years amount to over one billion dollars.

State (TCI) - State Transportation Capital Improvement

The State and local governments have developed a plan to meet 3.8 billion dollars of a 4.9 billion dollar requirement in the County over the next 20 years. We would hope that the federal government could find its way to meeting its 20% share for this region. If we are to meet the national objectives of clean air, reduced congestion and fuel conservation, all layers of government, including the federal government, must be willing to implement their share of the cost. The San Diego Region calls for the development of over 100 miles of rail transit projects, as well as significant improvements of the bus system to achieve our clean air and congestion relief goals.

On another matter, the San Diego region has been involved with, both politically and financially, the Los Angeles to San Diego corridor, or let me say now, the southwest corridor, for Amtrak service between Los Angeles and San Diego. This short corridor is the second busiest inter-city passenger corridor in the nation, carrying some 1.65 million passengers annually. Yet, as can be seen, the amount of federal participation in the improvements to this corridor amount to something less than 13% to the improvements made to date. Even 13% comes up to a federal participation of approximately 16 1/2 million dollars over the past 11 years. In contrast, direct federal appropriations and UMTA grants has spent some 2 billion dollars over the last 15 years in the so-called northeast corridor. Some federal recognition of our corridor is paramount in our goal of providing mobility to the citizens of this region (see pages 5 & 6).

To that end, the representatives from the Los Angeles, Orange and San Diego County regional agencies have established a Los Angeles to San Diego rail corridor agency (LOSSAN) and have developed a 12-year Capital Improvement Plan necessary to maintain and improve services in this important inter-city corridor. As you may be aware, this particular inter-city corridor is generating 111% of its operating costs out of the farebox. If we are to sustain this phenomenal achievement, infrastructure improvements must be made immediately.

The LOSSAN agency has developed a 12-year Capital Improvement Plan, which totals some 323 million dollars. Of that, we would be looking to Amtrak and UMTA for some 70 to 100 million dollars of this improvement (see pages 8 and 9).

In conclusion, while we are all aware of the budget shortfall on a federal level, the local State government should not be penalized for being proactive in developing local and State funding sources. To withdraw or even reduce federal participation at this time would send a clear message to other federally funded projects that locally developed funding sources hasten federal participation withdrawal, which would then lessen any local attempts to solve future problems.

Specifically, to the issues at your meeting here today, we would recommend that on the federal level there be developed a dedicated funding source through some sort of trust fund. The annual trial and tribulation of current UMTA funding policy leaves local agencies very much behind the eight-ball in trying to second guess in our budget development what may be happening. A degree of regularity would go a long way for practical budgetary decisions.

Second, allow for block grant funding for transit to be used discretionarily within the region without matched requirements. Local matched efforts should be based on overall regional efforts and not the effort on a single project. This would allow the region to package funding sources without distributing, on a very bureaucratic basis, preciously short funding to a multitude of important projects.

Third, federal laws, rules and policies have significant operating cost impacts, (i.e. the ADA, alternative fuels). The federal government bares some responsibility for funding. For example, pursuant to federal policy and soon to be law, the District has spent over 2 million dollars to lift-equip its entire fleet of buses. This fleet and wheelchair lifts cost approximately $200,000 a year to maintain. Current ridership figures show that out of 35,000 daily riders, only ten (10) trips make use of the federally required equipment.

Federal appropriations to inter-city, Amtrak corridors should be made on dense high use corridors. Public transit is not just an intra-city issue, but an inter-city issue, as well. Already, Amtrak carries more passengers between San Diego and Los Angeles than all major airlines combined. A small capital investment into this important inter-city corridor may be able to minimize or mitigate the need for ever larger and more expensive regional airports.

Again, I want to thank this subcommittee for offering me the opportunity to speak on the importance of the reauthorization of service transportation programs.

Sincerely,

Paul W. Price
Director of Service Development

PWP/cp

TESTIMONY OF
RAY REMY
SUBCOMMITTEE ON SURFACE TRANSPORTATION
JULY 2, 1990

CONGRESSMAN ANDERSON, CONGRESSMAN MINETA AND MEMBERS: THANK YOU FOR THE OPPORTUNITY TO BE HERE TODAY.

MY NAME IS RAY REMY. I SERVE AS THE PRESIDENT OF THE LOS ANGELES AREA CHAMBER OF COMMERCE AND SERVE AS A MEMBER OF THE TRANSPORTATION COALITION. I AM PLEASED TO REPRESENT THE LOS ANGELES AREA BUSINESS COMMUNITY AND TO GIVE OUR RECOMMENDATIONS AS CONGRESS BEGINS CONSIDERATION OF LEGISLATION TO REAUTHORIZE THE SURFACE TRANSPORTATION ASSISTANCE ACT.

LOS ANGELES IS THE SECOND LARGET URBANIZED AREA IN THE COUNTRY, WITH A POPULATION THAT IS SURPASSED BY ONLY FOUR STATES IN THE NATION OTHER THAN CALIFORNIA. ACCORDING TO RECENT PROJECTIONS, WE WILL ADD ABOUT 5.5 MILLION PEOPLE TO OUR AREA BETWEEN NOW AND THE YEAR 2010.

WE, IN THE BUSINESS COMMUNITY, RECOGNIZE THE INCREDIBLE ECONOMIC CHALLENGES WHICH HAVE RESULTED FROM OUR POPULATION GROWTH, AND OUR STRATEGIC POSITION ON THE PACIFIC RIM. WE ARE ALSO ACUTELY AWARE OF THE NEED TO ADDRESS THE CRITICAL ISSUES CONFRONTING SOUTHERN CALIFORNIA -- INCLUDING IMPROVING MOBILITY AND AIR QUALITY.

PUBLIC TRANSPORTATION IS A KEY PART OF OUR STRATEGY IN LOS ANGELES. AS YOU KNOW, WE ARE CURRENTLY BUILDING A COMPREHENSIVE 150 MILE RAIL TRANSIT SYSTEM WHICH SHOULD PLAY A SIGNIFICANT ROLE IN MITIGATING THE REGION'S MOBILITY AND AIR QUALITY PROBLEMS. ANOTHER VITAL ELEMENT IS THE EXTENSIVE CONGESTION MANAGEMENT RELIEF PROGRAM TO BE APPLIED TO CRITICAL INTERSECTIONS ON OUR CITY STREET AND COUNTY ROADS.

ON JULY 16 OF THIS YEAR, THE BLUE LINE WILL BEGIN OPEATION. THE 21 MILE DOWNTOWN TO LONG BEACH LIGHT RAIL LINE WILL TRANSPORT 35,000 RIDERS DAILY WITH 54,000 DAILY RIDERS EXPECTED BY THE YEAR 2000. THE BLUE LINE HAS BEEN CONSTRUCTED ENTIRELY WITH LOCAL PROPOSITION A SALES TAX FUNDS.

LAST MONTH, THE VOTERS OF CALIFORNIA MADE A MAJOR COMMITMENT TOWARDS TAKING RESPONSIBILITY FOR CALIFORNIA'S TRANSPORTATION FUTURE INTO THEIR OWN HANDS WHEN THEY APPROVED A 10 YEAR, $18.5 BILLION TRANSPORTATION IMPROVEMENT PROGRAM. SECRETARY SKINNER AND THE BUSH ADMINISTRATION HAD STRONGLY INDICATED THAT THEY WERE LOOKING FOR STATE AND LOCAL COMMITMENT IN FUNDING TRANSPORTATION SYSTEMS AND WE BELIEVE THAT CALIFORNIA ROSE TO THAT CHALLENGE. NOT ONLY HAVE WE BEEN WILLING TO RAISE MONEY AT THE LOCAL LEVEL THROUGH LOCAL SALES TAXES, BUT NOW THE STATE HAS MADE THE MAJOR COMMITMENT OF A 5¢ INCREASE IN THE GASOLINE TAX WITH A SUBSEQUENT 4¢ TO BE LEVIED OVER THE NEXT 4 YEARS. OUR CHAMBER WAS PROUD

TO SERVE AS A COUNTY CO-CHAIR FOR THIS EFFORT AND ALSO TO BE THE COUNTY ELECTION NIGHT HEADQUARTERS FOR PROPS 108 & 111.

ALTHOUGH THE MEASURE APPROVED BY THE VOTERS PROVIDES CRITICAL HELP IN FUNDING OUR 5-YEAR TRANSPORTATION IMPROVEMENT PROGRAM, THERE IS THE EQUALLY ESSENTIAL NEED FOR THE FEDERAL GOVERNMENT TO ASSUME ITS RESPONSIBILITY TO ASSIST IN THESE INVESTMENTS. IT IS WIDELY DOCUMENTED THAT DESPITE RAPID POPULATION GROWTH ACROSS THE COUNTRY IN THE LAST 10 YEARS FEDERAL SPENDING FOR TRANSIT HAS DECLINED FROM $4.6 BILLION IN 1981 TO JUST OVER $3 BILLION TODAY. WE PARTICULARLY FEEL THAT WHERE STATE AND LOCAL COMMITMENT HAS BEEN MADE THE FEDERAL GOVERNMENT ALSO NEEDS TO ASSUME ITS RIGHTFUL SHARE. THE IMPORTANCE OF THESE STATE AND FEDERAL DOLLARS CANNOT BE OVERSTATED.

WITH THE TREMENDOUS HELP THAT YOU HAVE GIVEN US, WE HAVE BEEN SUCCESSFUL IN SECURING THE $667 MILLION FUNDING THIS PAST APRIL TO BE USED ON MOS-2, THE SECOND LEG OF OUR METRO RAIL PROJECT. YOUR CONSISTENT AND CONSTANT SUPPORT HAS MADE THAT PROJECT POSSIBLE; AND THROUGH YOUR CONTINUED HELP, WE LOOK FORWARD TO EXTENDING THAT SYSTEM ON OUT TO THE SAN FERNANDO VALLEY, AS HAS BEEN CONTEMPLATED THROUGH ALL OF OUR PLANNING PROCESS.

IT SHOULD BE NOTED THAT SOME $180 TO $200 MILLION FROM THE PRESENT AUTHORIZATION WILL NOT HAVE BEEN APPROPRIATED BY THE SEPTEMBER 30, 1991 DATE, ON WHICH THE PRESENT SURFACE TRANSPORTATION ACT

38-253 O—91——74

EXPIRES. WE WILL, THEREFORE, NEED TO EXTEND THIS REMAINING AUTHORIZATION IN THE PROVISIONS OF THE NEXT SURFACE TRANSPORTATION ACT.

LONGER TERM PLANNING UNDERWAY HERE IN LOS ANGELES LOOKS AT EXTENDING THAT METRO RAIL PROJECT TO THE TRANSIT DEPENDENT AREAS OF EAST LOS ANGELES, AND WESTWARD TO THE VERY DENSE RESIDENTIAL AND COMMERCIAL BASES OF WESTWOOD AND CENTURY CITY. THESE INVESTMENTS WILL FURTHER ENHANCE THE ABILITY OF PEOPLE TO MOVE AROUND THIS REGION AND PROVIDE A CLEAR ALTERNATIVE TO THE EXTENSIVE FREEWAY NETWORK.

PLEASE KEEP IN MIND AS YOU REVIEW OUR REQUESTS FOR REAUTHORIZATION OF THE SURFACE TRANSPORTATION ACT THAT THE LOS ANGELES AREA IS FIRMLY COMMITTED TO PROVIDING SUBSTANTIAL LOCAL FUNDING FOR RAIL AND OTHER TRANSPORTATION IMPROVEMENT PROJECTS. IT IS WELL DOCUMENTED THAT WE HAVE A MAJOR LOCAL MATCH FOR THE METRO RED LINE FUNDING; AND THAT WE HAVE CONSTRUCTED BOTH THE BLUE LINE TO LONG BEACH AND THE 20-MILE NORWALK TO EL SEGUNDO LINE, IN THE MIDDLE OF THE GLENN ANDERSON FREEWAY, ALSO BY LOCAL FUNDING.

WE BELIEVE THAT THE NATION DEMANDS THAT WE HAVE A PROGRESSIVE, FAR-REACHING REAUTHORIZATION OF THE SURFACE TRANSPORTATION ACT. THAT EXISTING TRUST FUND MONIES SHOULD BE SPENT FOR THE PURPOSES FOR WHICH THOSE FUNDS WERE COLLECTED; THAT THE GAS TAX AT THE FEDERAL LEVEL CLEARLY NEEDS TO BE REAUTHORIZED AND THAT THOSE FUNDS SHOULD BE SPENT FOR TRANSPORTATION PURPOSES AND NOT DIVERTED FOR OTHER GENERAL FUND PURPOSES IN THE FEDERAL BUDGET. WE BELIEVE

THAT THERE SHOULD BE FLEXIBILITY IN THE DECISION MAKING ON HOW THE DOLLARS CAN BE SPENT BETWEEN TRANSPORTATION MODES, IN THE METROPOLITAN AREA; AND THE PLANNING PROCESS FOR THESE FUNDS SHOULD BE BUILT ON A COOPERATIVE AREA-WIDE AND STATE PLANNING PROCESS. WE BELIEVE THAT IN SOUTHERN CALIFORNIA WE HAVE THE NECESSARY BUILDING BLOCKS FOR THIS PROCESS THROUGH THE WORK OF OUR COUNTY TRANSPORTATION COMMISSIONS AND OUR OTHER APPROPRIATE TRANSPORTATION AGENCIES.

WE LOOK FORWARD TO WORKING WITH YOU AND PROVIDING STRONG AND CONSISTENT SUPPORT AS YOUR MEASURE MOVES THROUGH CONGRESS NEXT YEAR.

JOINT TESTIMONY OF THE

ORANGE COUNTY TRANSIT DISTRICT

AND

ORANGE COUNTY TRANSPORTATION COMMISSION

BEFORE THE

SURFACE TRANSPORTATION SUBCOMMITTEE

OF THE

HOUSE COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION

JULY 2, 1990

LONG BEACH, CALIFORNIA

Good morning Mr. Chairman and members of the Committee. My name is Thomas F. Riley. I am a member of the Board of Supervisors representing the Fifth Supervisorial District in Orange County. I am a member and the immediate past Chairman of the Orange County Transportation Commission. This morning I will also be speaking on behalf of the Orange County Transit District.

I want to thank you for the opportunity to testify this morning on behalf of Orange County's transportation agencies regarding the upcoming reauthorization of federal highway and transit programs. Before I begin, just a few words about Orange County.

Once in the shadow of Los Angeles, Orange County has become enormously successful and a powerful economic engine in its own right. After three decades of explosive growth it is home to 2.3 million people. The county has produced 1.2 million jobs and boasts an unemployment rate of less than 3 percent. If its goods and services were a gross national product, it would rank as the 40th largest economy in the world.

Since much of Orange County's growth has come after the state and federal governments slackened their freeway building activities, we have had to turn to other options, including:

(1) Developer fees that are the highest in the nation, paying for roads well beyond the site of a development, including a fee program that is a catalyst for California's first three tollways.

(2) We lead the state in miles of High Occupancy Vehicle (HOV) lanes, with more under construction. We are well on our way to completing a 90 mile system of exclusive lanes for carpools and buses.

(3) We recently introduced the first southern California commuter rail running between south Orange County and downtown Los Angeles, and with other counties in the region are experiencing a resurgence in public interest in rail transit. Meanwhile our bus system continues to hit new records for patronage with improved recovery of costs from the farebox.

The downside of this success story, however, has been a persistent lack of public financing for needed transportation projects. Despite our efforts, traffic congestion continues to worsen for lack of adequate investment. Over the next several months, we will join in the benefits of California's recent voter-approved

fuel tax while also considering a third try at voter approval of a local transportation sales tax.

With these observations as background, I will summarize our key recommendations on a new national surface transportation program.

First and foremost we encourage you to preserve and protect the federal revenues that have built and supported so much of our transportation system. We view the fuel tax as a "user fee" that should be dedicated to transportation investments. We recommend that you make permanent the Highway Trust Fund and the revenues to support it.

As you know, much of our existing transportation infrastructure is in a state of decline while, at the same time, population and economic growth in areas like Orange County requires new highway and transit investments. Less than a month ago, California voters recognized these realities in approving a state gas tax increase.

However, this type of voter support for funding the transportation infrastructure would not have been possible if the federal government were diverting fuel taxes for non-transportation uses. We urge this Committee to maintain its strenuous opposition to increasing fuel taxes for purposes of reducing the federal budget deficit.

Equally important to public attitudes and receptivity to new transportation initiatives, is ensuring that residents of California, along with the rest of the country, receive a "fair share" return on their fuel tax dollars. I strongly recommend that you work to preserve the 85 percent minimum allocation for federal highway funds that you first enacted in 1983.

As part of the effort to protect and preserve the federal revenue base, we recommend that you reconsider the current federal policy of exempting alternative fuels from federal "user fees." Currently, the effect of these exemptions on the Highway Trust Fund is minimal. However, as the use of these

fuels becomes more prevalent, and perhaps mandatory, we are concerned that there will be a significant drain on revenues. We believe that now is the time to address this issue and preserve the long-term integrity of the Trust Fund.

Just as important as preserving the Highway Trust Fund, is the urgent need to manage it effectively. Our primary concern is with the current large unspent balance in the Fund. While these monies sit idle in order to cushion the true magnitude of the federal budget deficit, critical surface transportation needs go unfunded. At the same time, public knowledge of the situation seriously undermines our credibility with voters and with users of the transportation system.

We urge this committee to support actions that will permit spending down the Highway Trust Fund balance to prudent levels at a reasonable rate. In addition, we urge a gradual lifting of the obligation limits for transportation programs to prevent further buildup in the Trust Fund.

We recommend that a portion of the funds made available by reducing the Trust

Fund balance be earmarked for development of a program to encourage and reward local investments in transportation improvements that serve regional and interstate, as well as local travel demand. The state of California has implemented such a program as part of the recent fuel tax increase, setting aside more than 10 percent of the new revenues to match locally generated funds. A similar federal grant program would encourage the development of new intergovernmental and public-private partnerships needed to solve our transportation problems.

To further encourage local and private investments in our transportation infrastructure we urge you to build upon the limited authorization for toll road financing that this Committee championed in the last federal reauthorization act. From my perspective as a board member for one of joint powers agencies in Orange County that is designing and building a tollway under the H.R. 2 pilot toll road provisions, I urge you to make this program permanent. Further, we recommend that you consider eliminating barriers to retrofitting tolls on facilities which have aged beyond their design life and for the integration of private toll facilities with the federal-aid-system.

With regard to your reauthorization of specific transportation programs, we strongly support a continued federal role in the rehabilitation and replacement of the federal-aid-highway system to protect the enormous investment already made in these facilities. To ensure that federal dollars are spent where they will do the most good, we also support some consolidation of the numerous categorical programs, with greater state and local flexibility in spending decisions.

In light of the many requirements now being imposed on local government for congestion management, air quality improvements and mobility for the elderly and handicapped, we also urge you to continue federal support of transit programs, including the dedication of one penny of the federal fuel tax to transit. In addition, we support a greater reliance on formula allocation of funds for transit capital improvements, along with greater flexibility in their use.

We are also concerned about the process for handling federal transit grant

requests, particularly the trend toward earmarking funds for projects in advance of the filing of grant applications. An attachment to my written testimony describes an interchange project to connect operating segments of our HOV lane system that we believe will compete well for federal funds based on its cost effectiveness and local funding support.

While we recognize that this Committee does not have jurisdiction to award this grant, we are concerned that all available funding for upcoming years will be lost to us through earmarking. We respectfully request your support in ensuring that all applicants may compete for federal transit grants on a level playing field.

Mr. Chairman and members of the Committee that concludes my remarks. Thank you, once again, for the opportunity to speak on behalf of Orange County.

ADDENDA TO TESTIMONY by
ORANGE COUNTY TRANSPORTATION COMMISSION
ORANGE COUNTY TRANSIT DISTRICT
Before
THE SUBCOMMITTEE ON SURFACE TRANSPORTATION
OF THE
PUBLIC WORKS AND TRANSPORTATION COMMITTEE
U.S House of Representatives
July 2, 1990
Long Beach, California

A significant component of the County's integrated transportation program is an approximate 90-mile system of operating and planned commuter lanes and a 20-mile transitway to provide for high occupancy vehicle (HOV) priority treatment throughout the county.

The transitway will tie the various HOV facility components together and is designed to directly serve the county's major activity centers. It consists of a barrier separated core project on I-5 combined with buffer separated lanes with exclusive access and egress ramps to local streets and arterials on the SR 57, SR 55, and I-405 freeways. For those interchanges with high traffic volumes, direct connection will be provided. These interchanges at I-5/SR 57 /SR 22, I-5/SR 55, and SR 55/I-405 represent significant capital investments designed to provide major travel-time savings to a large number of users. These direct connections are required if the countywide transitway and commuter lane system is to operate as a total system, provide relief for the traffic bottlenecks associated with freeway-to-freeway interchanges, and assure HOV commuters a safe and reliable trip.

Over the past several years, the Orange County Transit District and the Orange County Transportation Commission have taken joint actions in support of the development of transitways in Orange County, and in particular the core project on I-5. Concurrent with the CALTRANS project to widen I-5, the transitway

project is expected to be under construction by mid-1991. Transit District staff is currently completing an Urban Mass Transportation Administration sponsored Alternatives Analysis/Environmental Assessment (AA/EA) for the SR 55/I-405 interchange connectors which is intended to be the second phase of the transitway development program.

Local funding has and will be used to complete the core transitway project. It is anticipated, however, based upon the favorable reviews by UMTA staff, that the SR 55/I-405 transitway connectors will be partially funded by a federal grant.

In a letter to Representative William Lehman, Chairman of the Subcommittee on Transportation, House Appropriations Committee, last April, the Urban Mass Transportation Administration Administrator discussed criteria for Section 3 New Start Program funding of local projects. The first criteria is cost-effectiveness and the second is local financial effort. We believe that the SR 55/I-405 interchange project deserves your support based on its rating on both of these criteria.

UMTA Administrator Brian Clymer's April 5, 1990 letter shows in Attachment 2 that Orange County's project ranks best in cost-effectiveness of the five projects listed as being cost-effective. Cost-effectiveness is defined as total cost per new trip, or "dollars per new trip index". The projects described as "Likely to be Cost-Effective" include Los Angeles Metro extensions at $5.60 and $4.20 in 1985 dollars, with Orange County's project calculated at $3.75 in 1989 dollars.

TESTIMONY
Page 3

In terms of local financial commitment, Orange County is projecting a local match of 25% to receive a $152 million UMTA grant. This must be placed in perspective in that the initial phases of this project have been and will be 100% locally funded. Thus the total cost of the 20-mile core transitway will be $462 million, with UMTA being asked to provide only about 33% in the form of a Section 3 grant for the SR 55/I-405 project.

The application for this grant will be submitted in the fall of 1990. We respectfully ask for your endorsement of this Orange County project. We recognized that the Appropriations Committee has jurisdiction over this funding, and we have become concerned that Congress has been endorsing future projects by earmarking funds in advance of the filing of grant applications. Therefore, we fear that Section 3 funding for the upcoming years could be committed before this project reaches the point in the UMTA process for grant application. We hope you can help us in whatever way is appropriate to see that funding is available for this very cost-effective project for Orange County.

COMMUTER TRANSPORTATION SERVICES, INC.
TESTIMONY BEFORE THE SUBCOMMITTEE ON
SURFACE TRANSPORTATION
COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION
U. S. HOUSE OF REPRESENTATIVES

HEARING ON REAUTHORIZATION OF THE POST-INTERSTATE
SURFACE TRANSPORTATION PROGRAMS

MONDAY, JULY 2, 1990
LONG BEACH, CALIFORNIA

TESTIMONY DELIVERED BY JIM SIMS, PRESIDENT

Commuter Transportation Services, Inc.
3550 Wilshire Boulevard, Third Floor
Los Angeles, California 90010
(213) 380-7750

My name is Jim Sims and I am President of Commuter Transportation Services, Inc., -- CTS. We are the oldest and largest commute management company in the country. We represent more than 12 million people in the four county Southern California area and currently serve over 3,000 major worksites.

While CTS recognizes and supports the value of capital transportation projects, we concentrate our resources on making the best use of the system already in place -- through transportation demand management (TDM). TDM works by managing vehicles on the roads in the following ways:

1. By increasing vehicle occupancy through such programs as carpooling, vanpooling, high occupancy vehicle (HOV) lanes, park and ride lots and parking management.
2. By increasing the use of public mass transit.
3. By decreasing the need to commute -- especially during peak hours. This is achieved through telecommuting from home or neighborhood work sites, four day work weeks, staggered work hours, biking and walking to work.

I would like to make three recommendations for consideration in the Surface Transportation Reauthorization Act:

1. The Highway bill must explicitly recognize transportation demand management as a key strategy to improve mobility.

TDM enables us to maximize the use of streets and highways that are already in place. In addition, it has other significant benefits:

• TDM is cost effective. In the CTS fiscal year 89-90 which ended last week, we had an organizational budget of 6.5 million dollars. During the year we placed 45,000 individuals in ridesharing arrangements. That same 6.5 million would have bought the construction of 1,000 feet of light rail, 343 feet of freeway and 121 feet of underground rail.

TDM also brings a new partner to the table -- the private sector. In 1985, on average, major employers in Southern California spent less than $5 per employee per year on their ridesharing programs. Now these companies are spending between $50 and $200 per employee per year. While much of this increase has come as a result of air quality regulations, it is an example of how the private sector can contribute to the solution through demand management programs.

• TDM reduces air pollution. The 45,000 trips that we reduced last year saved 15,348 tons of emissions. And , our cost per ton of air pollution reduced is $443 compared to industry's cost for stationary sources of $4,000 per ton.

o TDM conserves energy. Last year CTS reduced gasoline consumption by 30.7 million gallons.

o TDM is less disruptive. Reducing wear and tear on the highways reduces maintenance interruptions. Accomplishing TDM goals does not require that residents be displaced against their will.

Urban congestion threatens our nation's economic vitality -- that same economic vitality that our highway system was built to promote:
The majority of our nation's work force is employed in urban areas and the greater part of our gross national product is produced in urban areas. We must be able to move our goods and services and employees in and out of work centers.

In addition to urban congestion, we have seen suburb to suburb commute patterns emerge as the major source of commute vehicle miles driven. These commuters can be more efficiently served through demand management strategies.

My second recommendation for the Highway bill is:

2. Highway funds must be as available for demand management programs as they are for system management and capital projects. And, there must be parity in the federal match ratio.

States should be given the opportunity to spend their federal funds on what works best for them. Their judgment should not be prejudiced by a discrepency in match levels. There should be no inducement for selecting transportation solutions for reasons other than absolute effectiveness.

My third recommendation is:

3. The Highway bill must designate funding for demand management research.

There is abundant data to indicate that removing single-occupant vehicles from the road through managing demand is not only cost effective, but also a viable long-term solution. However, we do not have studies deep or broad enough to fully evaluate and fine-tune which strategies work best in which cases, and at what points mode shifts occur. Because of this void in data, we urge that funds be designated for TDM research. Considering the significant fiscal and policy decisions on which this information depends, it would be a gross oversight to not build in a component to quantify the effectiveness of the demand side of the transportation equation.

The Highway Act, historically, has embodied our nation's transportation vision. With the completion of the interstate there must be a new vision -- one that recognizes our growth and changes and addresses them appropriately. The vision must consider and complement other federal policies such as fiscal prudence and clean air/quality of life issues.

The time has come for transportation demand management to be recognized as a significant part of the transportation solution and be supported at a level commensurate with its value. The Highway Act is the place to do it.

Mayoral Testimony/Subcommittee on Surface Transportation

Mr. Chairman and Members of the Congressional Subcommittee on Surface Transportation, my name is Luigi A. Vernola and I am the Mayor of Norwalk. I am testifying today on behalf of Norwalk and the Mayors of Santa Fe Springs and La Mirada.

As the Subcommittee is aware, tremendous growth in Southern California since 1950 has put great pressure on local transportation systems. This pressure has created an immediate need for creative and innovative multi-modal approaches to correct current shortcomings.

We asked to testify before you today to bring to the attention of the Subcommittee our concerns regarding the widening of Interstate 5. Current funding provides for widening only to the confluence of SR-91 and again from I-605 South. This means that the link from SR-91 to I-605 is not funded through the Cities of Norwalk, Santa Fe Springs, La Mirada and Downey.

The section of roadway we are speaking about was constructed to the current design standards of the early 1950's. For the purposes of historical perspective, this was the first Federally funded section of the Interstate System. As we all know, it is a system that has kept America at the forefront of technology and an economic leader.

The Cities represented here today are especially concerned about four issues that arise due to the proposed improvements. These issues are ones dealing with **transportation, the environment, public safety and the economic survival of the region surrounding the improvements.**

With the understanding that the intent of National Transportation Policy is to look at improvements regionally, we feel the plan for the current improvements would cause a bottleneck on I-5 that would diminish many regional benefits, as well as drastically contradict the initial intent of the improvements. This departure from a regional transportation perspective has resulted in spotty improvements that will not improve the regional traffic needs. Currently, capital improvement dollars are spent where it is easy to do so, leaving more complicated sections neglected with the end result being a diminished regional transportation benefit.

Further, from a pollution standpoint, a bottleneck on the I-5 where it passes through our cities would have a tremendous air quality impact given the volume of traffic on this roadway. The slow down in this affected area would concentrate vehicles and their exhaust in our cities thus having an air quality impact that none of us is comfortable with and will have extremely negative pollution implications.

The lack of necessary ramp improvement construction to the I-5 due to no decision on future designs leaves our region with serious congestion problems at the freeway ingress and egress points as

well as bridges for local street systems. Fire, Paramedic and Law Enforcement Services are severely impacted because of freeway related deficiencies.

Our communities of Norwalk, Santa Fe Springs, La Mirada and Downey developed along the I-5 corridor and currently are in the midst of redevelopment activities to bolster our economic viability as is necessary for municipalities to do these days. Clearly if in the future the region is to remain economically sound and have a regional transportation perspective, improvements to the I-5 between Highway 91 and I-605 are a must.

However we also, have the responsibility of being protective of the business and industry that line the I-5 because of what they contribute to our tax bases and our respective City's service levels. We cannot endorse a policy that would devastate local businesses by increasing the width indiscriminately of the I-5 right-of-way through our cities.

We do endorse a National Policy that would provide for the funding of improvements for this historic Interstate through a scheduled project. However, the economic vitality of our communities demands a creative, innovative approach to improvements development. For this segment, this translates into increasing capacity while staying within the current right-of-way.

Examples for the Subcommittee's consideration could be:

1) Reversible lanes to handle peak hour volumes if the volumes are unbalanced.
2) Center express lanes for long-distance, through traffic that would be physically separated from the local traffic.
3) An elevated, 4-lane express route to carry long distance, through traffic with the lower 6 or 8 lanes functioning as a collector-distributor and short-haul facility.
4) Relocating current interchanges and on/off ramp systems.
5) Looking at designs that are safe but different than the current Federal highway standards such as narrower lanes, tighter ramp curves and waivers from current design standards that work better in less densely developed areas.

Perhaps we also need to take a more aggressive stance in dealing with the motoring public and communicate that it is not possible to think in terms of "one driver - one car" anymore. We cannot let this mentality dictate our roadway needs. Let's look at designs that improve I-5 but do so from a more creative approach that better meet our future traffic volumes.

The current improvements on I-5 will be futile for both Orange County and Los Angeles County, if the portion of I-5 that runs through our cities does not receive some type of creative and innovative solution. Our cities are willing to work in concert with the State and Federal authorities in trying to reach some type of creative solution to the problem that we all face. We, as

cities, are willing to do whatever is feasibly necessary to satisfactorily address this issue, as is attested to today by our presence before the Subcommittee.

In closing, I would like to reiterate our desire to:

1) See the upgrading of the I-5 from Highway 91 to I-605.
2) Commence a study to address the problems that we have discussed.
2) Endorse authorization of funds for the project.
3) Encourage National Policy that fosters creative and innovative capacity improvement alternatives within the existing right-of-way.

Finally, I very much want to continue the relationship between Norwalk and the cities represented here today and your Subcommittee so that we can provide input into this process that will have such a dynamic transportation, environmental, safety and economic affect on our cities and on Southern California generally. This Interstate is a major link between Los Angeles and Orange County. Thank you.

TESTIMONY OF WILLIAM WOOLLETT, JR.

EXECUTIVE DIRECTOR, TRANSPORTATION CORRIDOR AGENCIES

BEFORE HOUSE OF REPRESENTATIVES

SURFACE TRANSPORTATION SUBCOMMITTEE

Orange County's three Transportation Corridors, the first toll roads in California, are an important step forward not only for the state but for the nation as well.

Design and construction of the Corridors is administered by a Joint Powers Authority comprised of the County of Orange and 13 cities. The roads will be financed through locally-generated funding by fees on new development, toll revenues, as well as possible 35% federal reimbursement.

The Corridors represent a unique public/private partnership formed to answer a regional transportation crisis.

Ground breaking is expected to begin on the nearly 70 miles of new highways late this year. All three will be under construction in 1991, with openings beginning as early as 1993, through 1996. Our ability to meet these deadlines depends to a great extent on our ability to comply with a variety of federal environmental regulatory requirements, including NEPA, the Endangered Species Act, the Clean Air and later Acts, and the Section 4(f) requirements.

I would like to focus my discussion today on the Transportation Corridor Agencies' efforts to comply with the Clean Air Act and Section 4 (f).

Even though the Transportation Corridors are a locally-funded answer to the traffic congestion crisis in Orange County, the process of designing and building these important facilities is nevertheless subject to federal regulatory processes through environmental and Federal Highway Administration requirements.

Clean Air Act Transportation Conformity Requirements

The Clean Air Act requires new transportation facilities to be determined to be in conformity with State Implementation Plans adopted pursuant to the Clean Air Act. In 1989, the South Coast Air Quality Management District adopted a dramatically new Air Quality Plan for the Los Angeles Basin to comply with the requirements of the Clean Air Act. The plan includes significant new requirements concerning the approval of new highways. These so-called "transportation conformity" provisions were developed after extensive discussions between the various local transportation authorities, Caltrans, the Air Quality Management District, the Air Resources Board, the Southern California Assn. of Governments, and the EPA.

The essence of the new transportation conformity procedures is that projects which are included in the Regional Mobility Plan component of the Air Quality Plan are not required to undergo separate project-by-project conformity determination as long as the project size and configuration is consistent with the size assumed in the Air Quality Plan.

Despite the elaborate efforts among the transportation and air quality agencies to achieve consensus on this issue, we are concerned that the EPA is attempting to impose new and additional transportation conformity procedures which could jeopardize the construction of the Corridors. In our view, it makes no sense to require additional review of a project's conformity with the Air Quality Plan once the project is specifically included in the Air Quality Plan. This is especially the case with regard to the South Coast Air Quality Plan, which makes it clear that some additional transportation improvements are needed to reduce congestion and assist the Basin in meeting the Clean Air Act ozone and carbon monoxide standards.

We sincerely appreciate the successful efforts of Chairman Anderson and the other members of this Committee to amend the House Clean Air Act legislation to make it clear that transportation conformity determinations are required to be made at the plan and program level, and that project-by-project conformity review is not required by the Clean Air Act. As you know, the Committee's amendment was endorsed by the California Air Resources Board and by Caltrans. We believe that the inclusion of the Committee's amendment in the Conference Report on the Clean Air Act is critical to our ability in meeting our scheduled opening dates for the three Transportation Corridors.

Section 4(f) Compliance

Section 4(f) of the Department of Transportation Act is another area of concern to the Transportation Corridor Agencies.

Section 4(f) prohibits the Federal Highway Administration from approving the use of parks and open space areas by highways unless there are no feasible and prudent alternatives to such use. The federal courts have interpreted Section 4(f) to apply not only to location of highways within parklands, but also the location of highways adjacent to park and open space areas. Section 4(f) creates some unique problems in Orange County because of the significant amount of parkland established by local government in the last decade, in the areas traversed by the proposed Corridors.

Many of these park and open space areas were established with the explicit understanding that the Corridors would be located in the vicinity of the parks. Indeed, in many cases, the parks and Corridors were planned together to minimize the impacts from the Corridors. We are proud of this planning process. It has resulted in the establishment of large, new park areas and environmentally-sensitive alignments for the Corridors. Nevertheless, we are concerned that recent judicial interpretations of Section 4(f) by the federal courts in California may jeopardize the Corridors. These courts have held that highways are subject to the requirements of Section 4(f) even where the park

areas and the highway facility are jointly planned to minimize the impacts of the highway.

Ironically, these court decisions are operating to discourage the establishment of new parks by local government because of their legitimate fear that the establishment of new parks will jeopardize the approval of critical transportation facilities. Thus, Section 4(f), a statute originally designed to protect parklands, is now interfering with the establishment of new park and open space areas. We encourage this Committee to investigate this problem and consider an appropriate legislative solution.

This $2.1 billion project has been made possible through an innovative combination of public sector support and private sector cooperation, as Orange County moves to solve transportation challenges with its own local solutions. Just as President Bush recommended in his transportation plan, the Transportation Corridors are a locally-funded answer to a local need.

Federal support is critical to local projects, but the fact that the federal government cannot fund all improvements must be understood and incorporated into policy-making. Local jurisdictions need assistance and incentives through federal legislation to make private toll facilities a reality.

Through the reauthorization of the federal highway program, the federal government can help bridge the gap

between available local financing and costs for new infrastructure.

Because the Transportation Corridors are a "pilot project," and given the funding constraints present in the state even following the recent passage of Proposition 111, the tollways continue to be affected at the federal level by transportation regulatory requirements. Therefore, the recognition by tne Congress and the Federal Highway Administration of the cooperative planning process underway in Orange County is vital.

The groundwork needed to make these projects a reality was laid long ago by key individuals in the county as well as on the state and national level.

In a state proud of advanced infrastructure and a renowned network of freeways, the concept of tolls on a California highway was a radical idea. But shrinking state and federal funds for new, desperately-needed highway miles forced Orange County officials into finding a solution.

The solution is three high-tech, state-of-the-art tollways designed with an eye toward preservation of the environment, and a commitment to future mass transit options.

In 1987, Congressman Glenn Anderson was instrumental in passage of public law 100-17, supported as he was by the House Committee on Public Works and Transportation. This legislation designated the Orange County Corridors as demonstration toll road projects.

Finance plans for the projects are currently being completed and the sale of toll revenue bonds will commence when necessary. Currently, the dual environmental and design processes underway are being funded through the collection of the development fees.

Because of the success to date in ensuring that these tollways become a reality, the program designating the Corridors as a pilot project is worthy of emulation. As America's infrastructure needs increase, the Orange County Transportation Corridors stand as an example of successful cooperation at all levels of government in accomplishing a goal benefitting its citizens.

TESTIMONY
BEFORE
SURFACE TRANSPORTATION SUBCOMMITTEE
OF THE
HOUSE PUBLIC WORKS AND TRANSPORTATION COMMITTEE

A. NORTON YOUNGLOVE, CHAIRMAN
SOUTH COAST AIR QUALITY MANAGEMENT DISTRICT
GOVERNING BOARD

JULY 2, 1990
LONG BEACH, CALIFORNIA

THANK YOU FOR ALLOWING ME TO TESTIFY TODAY ON BEHALF OF THE SOUTH COAST AIR QUALITY MANAGEMENT DISTRICT. WE REPRESENT AN AREA OF 13,350 SQUARE MILES WITH MORE THAN 12 MILLION RESIDENTS IN LOS ANGELES, ORANGE, RIVERSIDE, AND SAN BERNARDINO COUNTIES. OVER SEVEN MILLION WORK TRIPS ARE TAKEN EACH DAY IN THE SOUTH COAST AIR BASIN. IMPROVING OUR MOBILITY AND AIR QUALITY ARE BOTH ESSENTIAL TO THE ECONOMIC VITALITY OF THE SOUTH COAST BASIN AND THE HEALTH OF ITS RESIDENTS.

THE SOUTH COAST AIR BASIN HAS THE WORST AIR QUALITY IN THE NATION. OZONE AND CARBON MONOXIDE REACH MAXIMUM LEVELS NEARLY THREE TIMES THE NATIONAL STANDARD SET TO PROTECT PUBLIC HEALTH. FINE PARTICULATE MATTER (PM10) REACHES LEVELS OF NEARLY TWICE THE NATIONAL HEALTH BASED STANDARD. THIS BASIN IS THE ONLY AREA IN THE NATION STILL EXCEEDING THE NITROGEN DIOXIDE HEALTH STANDARDS. BASIN RESIDENTS INCUR BILLIONS OF DOLLARS IN DAMAGE TO HEALTH, MATERIALS, AGRICULTURE AND VISIBILITY.

TRANSPORTATION SOURCES CONTRIBUTE SUBSTANTIALLY TO OUR AIR QUALITY PROBLEM. WHEN COMPARED TO TOTAL POLLUTION EMITTED IN THE SOUTH COAST AIR BASIN, CARS AND TRUCKS CONTRIBUTE 46% OF REACTIVE ORGANIC GASES (ROG), 59% OF THE NITROGEN OXIDES (NO_X) AND 87% OF THE CARBON MONOXIDE (CO). REACTIVE ORGANIC GASES AND NITROGEN

OXIDES REACT IN THE PRESENCE OF SUNLIGHT TO FORM OZONE, OUR MOST SERIOUS AIR POLLUTION PROBLEM.

WITH THE SUPPORT OF THE STATE LEGISLATURE, THE SCAQMD HAS BECOME MORE ACTIVE THAN EVER IN THE PURSUIT OF HEALTHFUL AIR IN SOUTHERN CALIFORNIA. WE CAN ACHIEVE CLEAN AIR IN THE SOUTH COAST AIR BASIN THROUGH AN AGGRESSIVE PLAN OF ACTION OVER THE NEXT 20 YEARS. THIS ACTION PLAN, OFFICIALLY CALLED THE AIR QUALITY MANAGEMENT PLAN (AQMP) HAS LAID THE GROUNDWORK FOR AN INTEGRATED REGIONAL STRATEGY FOR ATTAINING HEALTHFUL AIR. THE PLAN INCORPORATES DOZENS OF TRANSPORTATION AND OTHER MEASURES WHICH, WHEN IMPLEMENTED, WILL HELP IMPROVE THE AIR QUALITY AND ALSO ADDRESS THE MOBILITY NEEDS OF OUR REGION'S RESIDENTS.

SOLVING SOUTHERN CALIFORNIA'S SMOG PROBLEMS ARE CLEARLY MADE MORE DIFFICULT BY GROWTH. IN DEVELOPING OUR SMOG CLEAN-UP PLAN, THE DISTRICT ALSO EVALUATED THE IMPACT OF GROWTH. IF THE AREA'S POPULATION AND BUSINESS ACTIVITY WOULD REMAIN AT TODAY'S LEVEL, EMISSIONS IN THE BASIN WOULD HAVE TO BE REDUCED BY ABOUT 65% TO ACHIEVE FEDERAL AIR QUALITY STANDARDS. HOWEVER, INCLUDING GROWTH IN THE PROJECTIONS RESULTS IN THE NEED TO REDUCE FUTURE EMISSIONS BY ABOUT 78%. DURING THE DEVELOPMENT OF THE BASIN'S CLEAN-UP PLAN, IT WAS CONCLUDED THAT MOST, IF NOT ALL, OF THE PROJECTED GROWTH IS INEVITABLE.

THE AQMP INCORPORATED GROWTH MANAGEMENT CONCEPTS SUGGESTED BY THE SOUTHERN CALIFORNIA ASSOCIATION OF GOVERNMENTS. THE ASSOCIATION CAME TO THE CONCLUSION THAT TRAFFIC COULD NOT BE CONTAINED AT TODAY'S LEVELS, BUT ITS RATE OF GROWTH IN THE FUTURE COULD BE SLOWED. AT PRESENT TRAFFIC GROWTH RATES, AN UNCONSTRAINED SYSTEM WOULD LIKELY SEE A 50-60% GROWTH IN VEHICLE MILES TRAVELLED IN THE DISTRICT BY 2010. HOWEVER, WITH THE ADDITIONAL MASS TRANSIT, CAR POOL LANES, TRAFFIC MANAGEMENT AND JOB/HOUSING BALANCE CALLED FOR THE AIR QUALITY MANAGEMENT PLAN, TRAFFIC GROWTH CAN BE CUT IN HALF. THIS APPROACH STILL LEAVES THE DISTRICT HAVING TO SOLVE THE AREA'S SEVERE AIR QUALITY PROBLEMS IN THE FACE OF A 25-35% INCREASE IN TRAFFIC.

I WOULD LIKE TO SHARE WITH YOU SOME OF THE PRINCIPAL OBJECTIVES OF THE REGIONAL MOBILITY PLAN WHICH ARE INCORPORATED INTO THE AIR QUALITY MANAGEMENT PLAN AND OUR THOUGHTS ON HOW YOU CAN HELP US TO ACHIEVE OUR AIR QUALITY AND MOBILITY ENHANCEMENT GOALS THROUGH THE REAUTHORIZATION OF THE SURFACE TRANSPORTATION ASSISTANCE ACT.

THE PRINCIPAL OBJECTIVES OF THE REGIONAL MOBILITY PLAN ARE TO:

38-253 O—91——75

- ATTAIN AND MAINTAIN MOBILITY IN AN ENVIRONMENT OF RAPID POPULATION AND ECONOMIC GROWTH.

- TO ACCOMMODATE THE TRANSPORTATION DEMANDS OF PEOPLE AND GOODS GIVEN THE ADOPTED GROWTH-MANAGEMENT FORECAST.

- TO INDUCE CHANGES IN TRAVEL BEHAVIOR THAT WILL LOWER THE NUMBER OF HOME-TO-WORK TRIPS AND INCREASE VEHICLE OCCUPANCY, AND PROVIDE THE SUPPORT TO CONSTRUCT THE NECESSARY INFRASTRUCTURE.

- TO ACHIEVE AN EFFICIENT BALANCE AMONG ALL MODES, INCLUDING NEW TECHNOLOGIES.

- TO MAXIMIZE USE OF EXISTING FACILITIES THROUGH SYSTEM AND DEMAND-MANAGEMENT TECHNIQUES.

- TO SUPPORT A PATTERN OF DEVELOPMENT THAT SHORTENS TRIP LENGTHS THROUGH COMPREHENSIVE PLANNING.

YOU CAN ASSIST US IN ACHIEVING THESE GOALS BY:

- SUPPORTING AND GIVING PRIORITY TO FUNDING PROGRAMS FOR IMPROVED MASS TRANSPORTATION FACILITIES THAT

ARE LIKELY TO REDUCE TRIPS WHICH WOULD OTHERWISE BE MADE IN AUTOMOBILES.

- O SUPPORTING AND GIVING PRIORITY TO FUNDING THE DEVELOPMENT OF HIGH OCCUPANCY VEHICLE LANES WHENEVER CAPACITY IMPROVEMENT PROJECTS ARE PROPOSED RATHER THAN SIMPLY ADDING NEW GENERAL PURPOSE OR MIXED-USE LANES TO OUR ALREADY OVERCROWDED FREEWAYS.

- O SUPPORTING TRANSPORTATION SYSTEM MANAGEMENT INVESTMENTS WHICH WILL ALLOW US TO MANAGE THE EXISTING SYSTEM BETTER AND MORE EFFICIENTLY. FOR EXAMPLE, TRAFFIC SIGNALIZATION PROJECTS AND TECHNOLOGICAL IMPROVEMENTS SUCH AS THE CITY OF LOS ANGELES SMART STREET'S AND TRUCK MANAGEMENT PROGRAMS WHICH WILL IMPROVE TRAFFIC FLOW AND REDUCE EMISSIONS.

- O SUPPORTING PROGRAMS WHICH WILL LIMIT VEHICLE USE IN HEAVILY CONGESTED AREAS DURING PEAK TRAVEL PERIODS WHERE EMISSION CONCENTRATIONS ARE PARTICULARLY HIGH.

- O SIGNIFICANT ADDITIONAL CONGESTION REDUCTIONS COULD BE ACCOMPLISHED WITHOUT PUBLIC EXPENDITURES FOR TRANSIT IMPROVEMENTS IF CONGRESS WOULD DIRECT EPA

TO PROVIDE REALISTIC ALLOWANCE FOR TRIP REDUCTIONS AS A PART OF MEETING STATIONARY SOURCE AIR QUALITY REQUIREMENTS. TO BE MORE SPECIFIC, A STATIONARY SOURCE THROUGH MOVING CLOSER TO ITS EMPLOYEES OR CLIENTS, COULD ACHIEVE SIGNIFICANT AIR QUALITY AND TRAFFIC CONGESTION GAINS BUT IS UNABLE TO MEET THE EPA "PERMANENT" REQUIREMENT SINCE NOTHING IS FOREVER. CHANGING THAT TO BE BASED ON CURRENT OR REQUIRED PORTIONS OF FUTURE EMPLOYEES OR CLIENTS, OR EVEN OVER AN ANALYZED FIVE-YEAR PERIOD OR ANY OTHER REASONABLE CRITERIA, BUT NOT THE CURRENT INFINITY.

O SUPPORTING REQUIREMENTS FOR EMPLOYERS TO REDUCE WORK-TRIP-RELATED EMISSIONS. WE HAVE A PROGRAM IN THE SOUTH COAST AIR BASIN WHICH, AS OF TODAY, AFFECTS MORE THAN ONE MILLION EMPLOYEES WORKING AT OVER 1700 COMPANIES. WE EXPECT THAT 8000 COMPANIES WILL BE IN COMPLIANCE WITH THIS REGULATION WITHIN A YEAR.

IN ADDITION, THE INEQUITABLE TREATMENT FOR TAX PURPOSES OF EMPLOYER SPONSORED PROGRAMS TO ACCOMPLISH TRIP REDUCTION IS A MAJOR HURDLE TO MAXIMIZING THE EFFECTIVENESS OF THIS TRIP REDUCTION PROGRAM. YOU CAN SUPPORT CHANGES IN THE TAX STRUCTURE TO GIVE EQUAL TREATMENT TO EMPLOYER SPONSORED PARKING AND OTHER TRANSPORTATION

OPTIONS SUCH AS SUBSIDIZED BUS PASSES, VANPOOL SUBSIDIES OR CARPOOL INCENTIVES.

MANY OF THESE PROGRAMS CAN BE SUPPORTED BY A FUNDAMENTAL CHANGE IN THE WAY TRANSPORTATION FUNDS ARE ALLOCATED AT THE FEDERAL LEVEL. FLEXIBILITY IS REQUIRED SO THAT LOCAL AND REGIONAL OFFICIALS CAN DECIDE WHICH TRANSPORTATION INVESTMENTS ARE MOST EFFECTIVE AND EFFICIENT FOR THE REGION, RATHER THAN BEING CONSTRAINED BY FORMULA ALLOCATIONS BASED ON PROJECT CATEGORIES AS IS NOW THE CASE. THIS CHANGE CAN LEVEL THE PLAYING FIELD FOR TRANSPORTATION INVESTMENTS AND ELIMINATE THE INHERENT BIAS IN A SYSTEM WHERE CERTAIN TYPES OF PROJECTS ARE FAVORED OR GIVEN PROPORTIONATELY HIGHER FEDERAL SUBSIDY THAN OTHER TYPES OF PROJECTS.

BY THE SAME TOKEN, LOCAL AND REGIONAL AGENCIES NEED TO ASSURE THE FEDERAL GOVERNMENT THAT TRANSPORTATION FUNDS ARE SPENT EFFICIENTLY AND THAT SELECTED PROJECTS WHICH ARE BUILT WITH FEDERAL MONIES WILL IMPROVE MOBILITY AND CONTRIBUTE TO BETTER AIR QUALITY. THIS CAN BE ACCOMPLISHED BY INCORPORATING IMPROVED CONFORMITY PROVISIONS INTO THE FEDERAL CLEAN AIR ACT THAT WOULD REQUIRE LOCAL, REGIONAL, AND FEDERAL TRANSPORTATION PROJECTS AND PLANS TO CONFORM TO AIR QUALITY MANAGEMENT PLANS SUCH AS THE SOUTHERN CALIFORNIA AQMP. THE SENATE VERSION OF PROPOSED AMENDMENTS TO

THE CLEAN AIR ACT CONTAINS AN IMPROVED CONFORMITY REQUIREMENT. WE STRONGLY SUPPORT THE SENATE'S VERSION BECAUSE IT WILL ALLOW SOUTHERN CALIFORNIA TO REACH ATTAINMENT. WITHOUT A FEDERAL REQUIREMENT FOR CONFORMITY REVIEW SOUTHERN CALIFORNIA MAY NOT BE ABLE TO ACHIEVE FEDERAL CLEAN AIR STANDARDS WITHIN THE TIME FRAME SET FORTH IN THE AQMP.

THANK YOU FOR ALLOWING ME TO TESTIFY TODAY AT THESE IMPORTANT HEARINGS. THE LINK BETWEEN AIR QUALITY AND TRANSPORTATION IS IRREFUTABLE. IN THE SOUTH COAST AIR BASIN WE ARE WORKING WITH THE TRANSPORTATION PROVIDERS TO COORDINATE OUR EFFORTS TO BRING ABOUT IMPROVED MOBILITY AND IMPROVED AIR QUALITY AS QUICKLY AS POSSIBLE IN ACCORDANCE WITH THE REGIONALLY ADOPTED AIR QUALITY MANAGEMENT PLAN. WE LOOK FORWARD TO YOUR SUPPORT OF OUR EFFORTS AND CONSIDERATION OF THE POINTS WE MADE TODAY AS YOU DELIBERATE THE REAUTHORIZATION OF THE SURFACE TRANSPORTATION ASSISTANCE ACT.

Mayoral Testimony/Subcommittee on Surface Transportation
July 2, 1990

Mr. Chairman and Members of the Congressional Subcommittee on Surface Transportation, my name is Luigi A. Vernola and I am the Mayor of Norwalk. I am testifying today on behalf of Norwalk and the Mayors and cities of Santa Fe Springs and La Mirada.

As the Subcommittee is aware, tremendous growth in Southern California since 1950 has put great pressure on local transportation systems. This pressure has created an immediate need for creative and innovative multi-modal approaches to correct current shortcomings.

We asked to testify today to bring to the attention of the Subcommittee our concerns regarding the widening of Interstate 5. Current funding provides for widening only to the confluence of SR-91 and again from I-605 South. This means that the link from SR-91 to I-605 is not funded through the cities of Norwalk, Santa Fe Springs, La Mirada and Downey.

With the understanding that the intent of National Transportation Policy is to look at improvements regionally, we feel the plan for current improvements would cause a bottleneck on I-5 that would diminish many regional benefits. This departure from a regional transportation perspective has resulted in spotty improvements that will not improve the regional traffic needs. Currently, capital improvement dollars are spent where it is easy to do so leaving more complicated sections neglected with the end result being a diminished regional transportation benefit.

Further, from a pollution standpoint, a bottleneck on the I-5 where it passes through our cities would have a tremendous air quality impact given the volume of traffic on this roadway. The slow down in this affected area would concentrate vehicles and their exhaust in our cities thus having an air quality impact that none of us is comfortable with and will have extremely negative pollution implications.

The section of roadway we are speaking about was constructed to the current design standards of the early 1950s. For the purposes of historical perspective, this was the first Federally funded section of the Interstate System. As we all know, it is a system that has kept America at the forefront of technology and an economic leader.

Our communities of Norwalk, Downey, Santa Fe Springs and La Mirada developed along the I-5 corridor currently are in the midst of redevelopment activities to bolster our economic viability as is necessary for municipalities to do these days. Clearly if in the future the region is to remain economically sound and have a regional transportation perspective, improvements to the I-5 between Highway 91 and I-605 are a must.

However we also, have the responsibility of being protective of the business and industry that line the I-5 because of what they contribute to our tax bases and our respective City's service levels. We cannot endorse a policy that would devastate local business by increasing the width indiscriminately of the I-5 right-of-way through our cities.

We do endorse a National Policy that would provide for the funding of improvements for this historic Interstate through a scheduled project. However, the economic vitality of our communities demands a creative, innovative approach to improvements development. For this segment, this translates into increasing capacity while staying within the current right-of-way.

Examples for the Subcommittee's consideration could be:

1) Reversible lanes to handle peak hour volumes if the volumes are unbalanced.
2) Center express lanes for long-distance, through traffic that would be physically separated from local traffic.
3) An elevated, 4-lane express route to carry long distance through traffic with the lower 6 or 8 lanes functioning as a collector-distributor and short-haul facility.
4) Looking at designs that are safe but less than the current Federal highway standards such as narrower lanes, tighter ramp curves and waivers from current design standards that work better in less densely developed areas.

Perhaps we also need to take a more aggressive stance in dealing with the motoring public and communicate that it is not possible to think in terms of "one driver - one car" anymore. We cannot let this mentality dictate our roadway needs. Let's look at designs that improve I-5 but not to the level demanded by future traffic volumes. We need to cooperatively develop alternative modes such as commuter rail, light rail, bus and car pools. It will be necessary to force the single driver into alternative transportation.

In closing, I would like to reiterate our desire to:

1) See the upgrading of the I-5 from Highway 91 to I-605.
2) Endorse authorization of funds for the project.
3) Encourage National Policy that fosters creative and innovative capacity improvement alternatives that stay within the existing rights-of-way.

Finally, I very much want to continue the relationship between Norwalk and the cities represented here today and your Subcommittee so that we can provide input into this process that will have such a dynamic economic and air quality impact on our cities and on Southern California generally. This Interstate is a major link between LA and Orange County. Thank you.

ADDITION TO THE RECORD

July 10, 1990

STATEMENT TO THE SUBCOMMITTEE ON SURFACE TRANSPORTATION
HOUSE COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION

on

REAUTHORIZATION OF THE POST-INTERSTATE SURFACE TRANSPORTATION PROGRAMS

SUBMITTED BY ALVALEE ARNOLD, CO-CHAIRMAN
CITIZENS UNITED TO SAVE SOUTH PASADENA

Mr. Chairman and Members of the Congressional Subcommittee:

Due to lack of notification we were unable to make a formal presentation at your field hearing on July 2, 1990, in Long Beach, California. However, we feel that our comments are important and request the inclusion in the records.

The expiration date of September 31, 1991, for the present Highway Trust Fund authorization is most appropriate.

The Era of Freeway Construction is over. It is now evident that more freeways in urban areas is NOT the answer to the traffic congestion that is becoming more devastating every day in the Los Angeles Area as well as in many other parts of the nation.

"Closing the gap" on the Long Beach Freeway through El Sereno, South Pasadena and a section in Pasadena will simply provide an additional six-and-a-half-mile section of gridlock. The cost, according to the cost of the Century Freeway, would exceed one BILLION dollars, and I don't know of anyone who will seriously predict that costs will go down. It is no longer a prudent, viable solution to our needs.

There are alternative solutions to our regional transportation problems that would be far more effective. For example, using the costs of the new Blue Line countywide rail transit system from Long Beach to Los Angeles, the estimate has been made that 58 miles of light rail could be constructed for approximately the same amount of money it will cost to build the six-and-a-half-mile gap of the (710) Long Beach Freeway.

The development of an integrated rapid transit system is the answer to moving people and goods in congested areas such as the Los Angeles area. By integrated rapid transit systems, I mean a combination of buses, Monorail, Light Rail, Commuter Trains, the Alameda Corridor, etc. all coordinated to move people and goods effectively.

South Pasadena is the 5th oldest incorporated city in Los Angeles County. The City of South Pasadena has been declared one of the Eleven Most Endangered Historic Places by the National Trust for Historic Preservation and, along with numerous other organizations, has pledged their support in our efforts, including litigation.

We recognize the need for a solution to our problems of providing mobility for the people. We are a part of the "people involved" and are eager for an acceptable solution.

Thank you for the opportunity to include our comments.

AlvaLee Arnold

REAUTHORIZATION OF THE POST-INTERSTATE SURFACE TRANSPORTATION PROGRAMS

THURSDAY, JULY 5, 1990

HOUSE OF REPRESENTATIVES,
SUBCOMMITTEE ON SURFACE TRANSPORTATION,
COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION,
San Jose, CA.

The Subcommittee met, pursuant to notice, at 10:00 a.m., in the City Hall, City Council Chambers, 801 North First Street, San Jose, California, Hon. Norman Mineta, Chairman of the Subcommittee presiding.

Present: Representatives Mineta, Bosco, Anderson and Packard.

Mr. MINETA. Today the Subcommittee on Surface Transportation continues its scheduled field hearings to help determine the sum and substance of Federal Aid Highway Mass Transit and Highway Safety Programs once the current programs expire on September 30, 1991.

During the past 34 years, Americans have enjoyed a tremendous Federal investment of more than $270 billion in our nation's transportation systems. We have built more than roads and bridges, interstates and mass transit systems. We have built a way of life that has sustained the American people and fortified our economy.

But what of tomorrow? Especially in such high growth, high mobility communities as San Jose, Santa Clara County and the entire San Francisco Bay Area. For tomorrow, we must make certain that Americans can travel safely. We must move people and goods in a way that will improve our air and our overall quality of life. And we must leave no doubt in the minds of our children that we will act consistently and with foresight.

Americans now travel more than two trillion miles on our highways each year. In the future, that level will only rise. Yet it is estimated that as a nation we will need to invest more than $95 billion annually just to maintain the current level of service through the year 2020.

The question is: Where will we get the money, and how should we use it?

Clearly the strong partnership that already exists among the American people, business, industry and all levels of government will be called upon to meet our challenges of building and rebuilding our transportation systems. But at the same time, we must never lose sight of the fact that how we spend that money is as important, if not more important than how much we spend.

More than a year ago, this Subcommittee on Surface Transportation set its legislative agenda. That legislative agenda is to build the transportation future America wants and needs. We have conducted many hearings in Washington, D.C. and we have received expert testimony. But the health and well being of our transportation network requires more hands-on input than any series of Washington hearings could provide. That is why we are today in San Jose.

Transportation is an overwhelming concern here in the Bay Area. One month ago, Californians throughout the region and the State voted decisively to increase the state tax on gasoline to fund transportation projects; and in so doing, sent a strong message to the rest of the nation. And that message is this: Under-funding our transportation needs may once have made some sense for the sake of short-term fiscal relief. Under-funding in the future, however, could be economic suicide in a new world which values butter more than it does guns.

In the 1960's and the 1970's, we spent more than 2.3 percent of our annual gross national product on our transportation network. In the 1980's, that level dropped to four-tenths of one percent.

All of you know the result. The result was congestion on our highways and decay of our mass transit systems. And the lesson is clear, transportation programs must never again be under-funded as they have been in the recent past.

In the 1990's, I believe the key to finding solutions to our nation's transportation problems will be to define the appropriate Federal role. I believe that Federal role must take into account state and local needs, program flexibility and the right of people who have paid taxes into the transportation trust funds to get what they have paid for and not see those funds idle away at the same time that there is talk of increasing the Federal Gasoline Tax.

Through this hearing and those to follow, I am confident that we will further our efforts to determine what the Federal role should be in the future and how we get from where we are today.

I would like to thank all of today's witnesses in advance for their testimony and offer special gratitude to the mayor and the city council of the City of San Jose for allowing the subcommittee to use this fine facility. I personally have spent a great deal of time in these chambers, especially in this seat as well, and so it does feel good to be here.

We are privileged to have with us the Chairman of the Full Committee on Public Works, Congressman Glenn M. Anderson of Southern California to be present with us here as the subcommittee meets.

Mr. Chairman, I appreciate your taking time for your own busy schedule to be here with us at these subcommittee hearings in San Jose. I am privileged and honored to have you here and at this time I would like to yield to you for whatever time you may wish to consume.

Mr. ANDERSON. Thank you, Mr. Chairman.

Chairman Norm Mineta, my fellow colleagues on the Public Works Committee, distinguished local officials and those of you in the audience, it is a pleasure to join you in San Jose for this very

important hearing on the Reauthorization of our Federal Highway and Transit Programs.

As we near the completion of our interstate highway system, we have the opportunity to re-deploy Federal resources which were previously used for its construction. And of course, we must make sure that any new Federal program preserves our investment in this system.

Remember, when we complete it, we will have spent more than $125 billion on our interstate highways, and we must not allow this investment to deteriorate. Yet we must also meet the challenges of rapid urban and suburban growth where the solutions will likely not be the construction of additional lanes of freeway. Meeting these challenges will test our creativity as we pursue more flexible solutions which meet the challenges of this rapid growth and the resulting traffic congestion.

The tremendous growth which you are experiencing right here in Santa Clara County and in the Bay Area in general, will truly test local transportation decisionmakers as they search for effective solutions. With the Amendment to the Clean Air Act soon to be considered by a House and Senate Conference Committee, compliance with the revised act will also be necessary, and funding associated with these activities will compete for scarce Federal resources in an era of Gramm-Rudman hearings. And that is one reason why I am looking forward to hearing this distinguished roster of witnesses testify throughout the day.

The testimony which you give today will greatly help us in our efforts in Washington to craft the most effective highway and transit programs. We must craft programs which will allow our country to continue to grow economically. No one, not the businessmen nor the consumer, benefits from having employees or goods sit in traffic on congested highways or surface streets.

In conclusion, we must craft transportation solutions which keep pace with our economic growth or traffic congestion will strangle our economy rather than allow it to blossom and all of us to prosper. And let me say that I can think of nobody that I would prefer to have coordinating and drafting our legislation in Washington than your own Congressman Norman Mineta.

I have worked with Norm since the people of San Jose were first wise enough to elect him to Congress and since that time, he has been a most effective advocate on your behalf, locally, and an outstanding leader on transportation issues nationally. And I have great confidence and trust in his abilities and look forward to working with him and with those of you who have taken the time to join us today as we proceed with this legislation which may be the most important bill facing Congress in 1991.

Thank you, Mr. Chairman.

Mr. MINETA. Thank you very much, Mr. Chairman.

At this time I would like to yield to a very fine colleague from the 43rd District here in the State of California. We have a very bipartisan committee on the Public Works and Transportation Committee and though there may be a few issues in which we do differ, it is based more on philosophical than it is along partisan lines and we are pleased to have Congressman Ron Packard with us.

Mr. PACKARD. Thank you, Mr. Chairman. It is a pleasure to be with you here in your own district and let me also add to what Chairman Anderson said about you. You have truly become one of the great leaders of this country in terms of surface transportation, highways, roadways and also the many issues you certainly have become an expert on.

It is a pleasure being here and to welcome the witnesses on the report of what they have to say this is the beginning of the process that this committee will be going through to develop the information and the basis upon which to develop our next 30 year transportation plan.

As many of you know, 35 years ago we began what has become an issue under state system which has become, in my judgment and in the judgment of many others, the greatest public works process in the history of the globe.

The networking and the lacing of this country with freeways across the country that has truly built this country into an economic giant. Without that network of interstates, there is no way that we could compete around the globe. That is because we had the foresight 35 years ago to plan the interstate plans until sunset. It will be completed at the end of about a year from now. A little over a year from now, I think that is the middle of 1991.

The funding mechanism and formula that has also sunset. So it is incumbent upon this committee, with the help of many of you and many others throughout this country, to develop a new transportation plan for the next 30 years at least; and to develop a new and perhaps different funding mechanism. Certainly, that will be our charge.

That is no small charge because funds are in short supply, as we know. And yet there are surpluses in our highway funds and the highway trust funds. Counties and cities as of this date that are passing within rather interesting and—I'm grateful—regularity, new money sources for transportation in the state of California.

That is absolutely essential. There is no way the Federal Government can fund the requirements that are going to be ours for the next three decades. We must get funds from local sources, from town sources and from state sources throughout the entire country. Otherwise we will not be able to pull ourselves out of the deep hole we find ourselves in now in terms of trying to get back to even with our trend from the past decades.

It is going to take high technology, in my judgment, to help us solve our problems. The next transit transportation plan is not going to be just placing lanes and more bridges and highways throughout this country. It is going to take some high-tech solutions, smart highways, smart vehicles, high speed rails, light rails and some other various mass transit systems that we are going to have to develop innovative ways to solve our problems. We all know grid lock on freeways and our highways and city streets is not acceptable for the next 30 years. We must find solutions and formulas.

I am very pleased too with my colleagues here and you good folks here in trying to find those key solutions that may help us to develop a more remarkable plan for the next 30 years than we had in the past.

Again, Mr. Chairman, it is a pleasure for you to be with us. I would like to welcome my colleague Barbara Boxer who you will probably introduce later, but it is always a pleasure to have her come and give her input in this process.

Thank you, Mr. Chairman for allowing me to join in this hearing.

Mr. MINETA. Thank you very much, Mr. Packard.

We are pleased to have as our lead off witness the Representative from the Sixth Congressional District here in the state of California, Congresswoman Barbara Boxer.

Barbara has been a tireless worker on our behalf on the Budget Committee, plus her work on the Government Operations Committee.

But Barbara, we do appreciate very much as we had to wrestle with our whole budget considerations this year, with your help as a member of the Budget Committee. When the Chairman and I, Chairman Oberstar testified before Congressman Slattery's Subcommittee on Revenue Needs, you were very helpful as it related to your thoughts about the Highway Trust Fund and the Aviation Trust Funds and the need to use those rather than to have those just accumulate and idle away.

So again, I appreciate your leadership and thank you very much and go ahead and proceed in your own fashion if you would. And following that, if you would join us here at the dais we would appreciate it. Barbara.

TESTIMONY OF HON. BARBARA BOXER, A REPRESENTATIVE IN CONGRESS FROM CALIFORNIA

Mrs. BOXER. Mr. Mineta, I am so pleased to be here with you and Chairman Anderson and Mr. Packard, and I join you in welcoming our colleagues to Northern California.

I just wanted to say for the record what an honor it is for me to be the lead off witness here today. My thoughts are really an echo of what all of you have said. We have got to move forward in rebuilding and expanding this country's highway and transit systems.

I just wanted to say for the record how important your leadership is, Mr. Mineta, because sometimes the people in your home town know you in one way and not in the other way. I just wanted to make it very clear to them that your leadership on these issues is stellar. And of course, having Congressman Anderson as the Chairman of the full committee is extraordinarily important for California; and to have the bi-partisan support that Mr. Packard brings. I think the Californians on that committee are absolutely key.

I will be very brief and will be delighted to join you until about the noon hour.

I think it is very clear to most Americans that the Cold War is ending. What that means is very good news for us. We can now begin to pay attention to our needs at home. And just as the Cold War is ending, the economic war is heating up. And today I want to make the point that we cannot win the economic war if we cannot move our people and our goods. There is no way we can

even begin to compete with the new Europe, with the Asian Pacific if we cannot move our people and our goods.

Now, we have been coasting on an infrastructure that was made in the 1950's that Mr. Packard talked about what a wonderful investment that was. It really was under Dwight Eisenhower that that investment was made. He had a vision; but since then, we really have not done enough. And just as in our own lives, if we neglect an investment, we are going to lose it and we are going to fall behind; and we really have not done enough. That is why I had such great anticipation when Secretary Skinner called a press conference to announce his visions of the future for our highways and our transit system, only to be terribly disappointed that it seemed to me that he was punting the ball to the states and the local governments.

Now, there is no question that Mr. Packard is right. We have to do this in a cooperative way. But we have to be part of the picture. The Federal Government has to be part of the picture, particularly since we are sitting with billions of dollars in a highway trust fund that has been building up; and it has been hiding to some degree the horrendous deficit that we face. This is really a fraudulent accounting gimmick; and it is totally unfair. We currently collect the Federal tax from our citizenry to sustain our roads and transit systems and yet we are not using it. And that is why I was very pleased to join with you in a losing fight that we wage; a very close fight that we wage to try and get that highway trust fund off the budget and use those funds for the purposes they are supposed to be used for. And I will be joining with you as soon as the Chairman feels it is time to press that issue forward again, because I think it is absolutely critical.

So we are in a new time now, and a new day and you are in the leadership and I am joining you today in saying, "Let us move forward. Let us be able to win this economic war by investing in our infrastructure." And I am very, very pleased to have the opportunity to open up this distinguished list of witnesses today.

Thank you very much, Mr. Chairman.

Mr. MINETA. Thank you very, very much, Ms. Boxer, for your statement and for your help as a Member of the Budget Committee. And I would like to have you join us here at the dias.

At this time, I would like to call on the Honorable Jim Beall, a member of the City Council here in San Jose as well as the Chair of the Transportation and Public Works Committee, League of California Cities and Vice Chair of the Transportation and Communications Committee of the National League of Cities.

Mr. Beall, your testimony will be made a part of the record and if you would go ahead and proceed in your own fashion.

TESTIMONY OF JIM BEALL, COUNCIL MEMBER, CITY OF SAN JOSE; CHAIR, TRANSPORTATION AND PUBLIC WORKS COMMITTEE, LEAGUE OF CALIFORNIA CITIES, VICE CHAIR, TRANSPORTATION AND COMMUNICATIONS COMMITTEE OF THE NATIONAL LEAGUE OF CITIES

Mr. BEALL. Thank you, Mr. Chairman. Good morning, members of the committee. I would like to welcome you to our Council cham-

bers where I spend a lot of time. It is rather unusual for me to be on this side. But I enjoy having the committee. I hope you will take any opportunity to visit San Jose and see the sites in our city.

I first want to commend the Chairman for scheduling this hearing and exploring the current state of transportation services in Northern California. I am pleased to have the opportunity to speak to you today representing not only San Jose, but the League of California Cities where I currently hold the Chairmanship for the League's Committee on Transportation and Public Works, and the National League of Cities Transportation and Communications Committee, of which I am Vice Chair.

I speak to you this morning with great optimism. On June 5th, the voters of California made many of us with a keen interest in transportation very happy. As you know, we approved propositions 111, 108 and 116 which will give us $18.5 billion additional in the next 10 years for transportation. This was the first great step to tackle some of the tremendous transportation problems we face in California.

To further sketch the transportation picture for Northern California, I would like to point out that many local governments have taken important steps in recent years to pass, with voter approval, increases in local sales taxes with the revenues dedicated to key transportation needs.

Santa Clara County, where you are today, has passed such a measure to improve three key corridors in our county. Since the passage of the Santa Clara County sales tax, many other Bay Area counties as well as other counties in California have passed similar measures. Many other Northern California Counties are now planning on similar ballot measures as well.

In addition to the above efforts, an important component of transportation finance that is often forgotten is the effort of local governments contributing local discretionary funds to transportation projects. Out of the total amount of city expenditures on transportation, somewhere between 40 and 50 percent comes from locally raised discretionary funds. This demonstrates a real commitment to transportation, especially in light of the state's impossible tax structure and the lack of authority of local governments since Proposition 13.

In spite of our optimism after June 5th, students of transportation finance in California realize that the resources in the foreseeable future will not be enough to provide an acceptable level of transportation service in this state and Northern California. In order to make the scarce resources go further, we have to exercise better judgment about our transportation facilities. This is especially true in our congested urban areas. The levels of government which shape transportation policy can no longer make decisions in an isolated manner. The full impact of each decision, not only for the jurisdiction making the decision, but neighboring jurisdictions, must be considered.

A cornerstone of the transportation package passed by the voters on June 5th was a requirement that local governments, counties and cities, in each urban county must adopt a congestion management plan designed to reduce traffic congestion and specifically link urban development decisions to the transportation system.

Congestion management plans which are consistent with regional and statewide transportation plans will have a competitive advantage for the funds made available by the June 5th vote; and local agencies will be able to withhold local tax subventions to neighboring jurisdictions if they do not comply with the congestion management plan. This is a completely new way of doing transportation business in California, necessitated by the tremendous gap between the state's transportation needs and its resources.

In addition to the improved planning requirements for the congestion management plan, leaders at all levels of Government are seriously debating alternative governing structures to deal with the unprecedented growth experienced in California. Several key legislative proposals are currently under consideration in Sacramento.

Additionally, both gubernatorial candidates have indicated support for establishing new institutions or rearranging old institutions in an attempt to get a better handle on urban development in this state. Central to any of these institutional changes will be our state and local transportation system. In the next ten years, we expect to see significant change in California as it relates to our transportation decision-making structure.

The next critical step for transportation in California is Congress' deliberations to develop a post-interstate transportation policy. The policy must fit with the developments that I have already outlined here today. The policy must provide needed revenue, but also permit the flexibility to spend the money wisely in accordance with state and local transportation priorities. California has taken critical steps to put its transportation program in order. Congress and the President must now act in such a manner as to complement this action. To accomplish this goal, I offer the following recommendations for the Federal post-interstate policy:

First a commitment must be made to complete the current interstate program.

Second, funding levels should be set to properly maintain and rehabilitate the existing federal system. The post-interstate program priorities should then be shifted to resolve the urban/suburban congestion problem.

Three, each state must be guaranteed a return on its federal taxes in an amount proportional to its contribution. As you know we are now in a deficit situation in California and I'm not sure how much. I would be really interested to investigate that. I believe it is about $150 million to $200 million a year if you look at it very closely. So I am very concerned about that.

Four, flexibility has to be built into the system to permit the expenditure of the money in accordance with high priority needs identified through the local planning process, regardless of mode of transportation or ownership of the system. An example is the urban, suburban and rural solution we talked about.

Five, the current FAU/FAS programs must be maintained initially at the current level and then increased to reflect increased cost in providing the service.

Six, the transportation trust fund should be established independent from the general Federal budget and should be not included in the deficit calculation. We fully support Congressman Anderson in his efforts to champion our cause in that effort.

Seven, the federal gas tax should not be increased for deficit reduction purposes.

And finally eight, the new Federal transportation policy should permit state and local governments to amortize billboards on Federal highways; and enhance highway safety through improved trucking regulation.

We hope these remarks will be helpful in your deliberations.

Again, thank you for this opportunity.

The local government officials of the United States and Northern California are ready to assist you in any way we can to develop a meaningful Federal transportation policy to lead us in the next century.

Thank you, Mr. Mineta.

[Prepared statement of Mr. Beall appears on p. 2486.]

Mr. MINETA. Thank you very much, Councilman Beall.

Chairman Anderson?

Mr. ANDERSON. Councilman Beall, you stated that the cornerstone of the recently enacted state transportation package is the adoption of a congestion management plan among local governments.

Can you explain to the committee how the local regional governments will determine the method for distributing state funds made available by the June 5th vote only among the local entities that have adopted the congested or congestion management plan?

Mr. BEALL. The congestion management plan is designated to set up an agency to specifically deal with congestion. It is made up of local government officials. The local government officials in each county or groups of counties are designated to set the priorities of the transportation fund in that particular area. So, for example, Santa Clara County's congestion management agency will develop a plan for handling congestion in this area and develop a priorities process whether they be transit highways, safety projects or whatever; this will be submitted to the regional agencies and the state governments in order to relieve our congestion management program in this area.

It will also guarantee certain local funds, such as the half cent sales tax we passed in this county to try to match those funds. Each city has to also agree to certain parameters regarding growth and development that are established by this congestion management agency.

Mr. ANDERSON. If they did not join the congestion management plan, would they still be eligible to get funds to do other things; or would they have to be a part of that plan and agree to work toward whatever the goal would be?

Mr. BEALL. Part of the law is that the congestion management agency would develop a plan and if the local government in that particular area, such as the county does not adopt the congestion management plan, then subventions and gas tax subventions can be withheld from that particular city government and so forth.

Mr. ANDERSON. Would they be withheld?

Mr. BEALL. Yes. There is a process for deciding whether or not those funds would be withheld. And it only amounts to the subvention of the state to the local government. That is about $3 billion

total for ten years as opposed to the total that we passed in June of $18.5 billion. It only affects that $3 billion total over ten years.

Mr. ANDERSON. Thank you, Mr. Chairman.

Mr. MINETA. Thank you, Mr. Chairman.

For the post-interstate surface transportation programs, preserving the Federal investment and the Federal Aid Highway programs will be a major priority. If the state and local governments are provided greater flexibility for the use of Federal funds, should there be requirements for the use of Federal funds for preserving the Federal Aid Highway System?

Mr. BEALL. I think that is an appropriate thing to do and I believe that is being done in California, but in some other states. I think we have to preserve our investment that we already made in the 42,000 interstate miles that we already have in this country. That is the position of the League of Cities that we maintain and preserve the interstate system. So we believe in the proper maintenance because we believe that if the Federal funds are not sufficient to maintain them, then eventually local and state governments are going to have to chip in to the job and that is part of the equation that we look at.

Mr. MINETA. Now under the pending amendments to the Clean Air Act, transportation projects in non-attainment areas may be limited to mass transit projects and highway projects that improve safety.

Will the proposed project limitations under the Clean Air Act amendments adversely affect transportation projects in the Bay area?

Mr. BEALL. It is a possibility that they will in certain cases. However, we are taking on that challenge by adopting these congestion management plans which have to take into consideration the air quality impacts of the various projects. So now in California with the congestion management plans, when we review a particular project, we will have to analyze the air quality impacts on those projects. So we feel that that is a positive way of reacting to the Clean Air mandates. It would be very difficult to complete a lot of the projects, however. We won't be able to build new freeways, I don't believe, in a lot of non-attainment areas.

Mr. MINETA. It seems to me that despite a congestion management plan under the Prop 111, the Clean Air Act may have precedent or priority over state law in that regard.

So if the limitation is there only for safety kinds of projects, it may stymie.

Mr. BEALL. One of the problems that we have in terms of local government officials is that we have a lot of mandates. We have a lot of people telling us what to do in terms of how we complete these projects; and you do try to cope with that. However, sometimes the single purpose type of legislation that deals with one thing affects something else. So if we are trying to solve transportation and also in the congestion, and try to solve air quality at the same time, sometimes they go across purposes. Then we have the whole thing with urban development and housing needs; and dealing with the housing responsibilities we now have the local governments. It becomes quite a burden to complete all of these things at once. That is one of the limits we face as local government officials.

Mr. MINETA. In your testimony, you talk about amortizing billboards on Federal highways. Do you have any recommendation as to what period of time that ought to be amortized in? Five years, seven years?

Mr. BEALL. I think the value of the billboards has to be determined in terms of each particular billboard, depending on its size and value, and amortized generally over five to seven years for a sufficient period of time.

Mr. MINETA. Very well. Thank you.

Mr. Packard?

Mr. PACKARD. Thank you, Mr. Chairman. I think I have fairly accurate figures on points that you brought up in relation to the amount contributed into the Federal system by California taxes and how much you have gotten back. We are on the 85 percent rule as you know which means that no state gets less than 85 percent of what they have contributed, even though the figures look like there are some states that do and I am not sure how that figures out, but California gets about an average of 86 percent of the monies back. Over the last 30 some years since the system has been in place, we have contributed approximately $1.8 billion more to the plan than we have received back.

Last budget year, however, we got about 100 percent—just a hair over 100 percent back. I think that is partly because we are now in the process of completing our interstate system in California whereas we have been delayed in getting some of our projects through until some of the more sparsely populated states had gotten theirs.

But the point is still very well taken in your testimony and that is that California has been and for all intents and purposes continues to be a donor state—a significant donor state. When we are talking about one percent of California's donation, we are talking about a lot more money than one percent of Idaho or Alaska's donation.

Are you recommending in this bill that we depart from the new plan; that we depart from the 85 percent floor and that every state get back an amount equal to what they give in or at least a portion equal to what they put in?

Mr. BEALL. I think some kind of different formula has to be done. Right now California, because of the FAU Interstate and the FAS formulas, we lose out and we would like to have a formula that responds to the fact that we are going to be—have the greatest population increase in the United States.

The population increase last year in California equalled the population of the City of San Jose. That is about 770,000 people who were added to this state. And we are trying to respond to the congestion and all the problems which our state has. At the same time, we are not even getting out the amount of money that is put in by our state.

So there has to be some type of a response to that. Because what happens, as I said before, if the Federal Government is not giving us our fair share, then what happens is we have to pick up the slack at the state level by passing tax increases. That is exactly what we have done in California.

Mr. PACKARD. In the existing interstate plan—it was designed that way, I think or at least part of the rationale was that there were some states, rural states specifically, who could not raise enough money to put the interstate system into their states, and thus it had to come from other sources which would be a redistribution of the funds and California, of course, more than those states that I had mentioned.

The thinking now is, among some, and particularly among California highway leaders is that the system, the backbone system has been built in every state under the interstate plan and that now a reach distribution more equitable in terms of returning an equal amount to every state. We will never get 100 percent back because of the moment the Federal Government takes over the collection of these funds and the redistribution of these funds, there is an administrative and other costs that will not return 100 percent dollars back to any of the states.

But you are recommending it be done a basis that would be more keeping with what's what.

Mr. BEALL. That's right.

Mr. PACKARD. Will mandating the Federal planning requirements assist and enhance the ability of the local governments to develop your congestion management plans, in your judgment?

Mr. BEALL. I think if there were some kind of a planning requirement, it would assist us. I mean planning in terms of allowing us to plan; not in allowing the Federal Government to plan. That would be the key thing for us.

If there was some kind of guidelines created that we could work with the Federal Government in creating, we could then develop the plan across the county and spend the money more wisely in the urban/suburban areas. The solutions for San Jose and our area is not the same as for Seattle or other major metropolitan areas. Each area has its own situation and demographics and so forth and geography. They should be required to develop plans to spend the money wisely.

But to have a kind of a broad brush, the "son of interstate" kind of program is something the League of Cities strongly opposes. We do not favor that because that is just lines on the map. It is not really solving congestion and we are strongly opposed to that at the state level and at the Federal level. We have been trying to get that message across.

Mr. PACKARD. Thank you very much.

Mr. MINETA. Let me introduce a very fine colleague from California, Congressman Doug Bosco, a member of our Committee on Public Works and Transportation and this subcommittee as well. Pleased to have you here.

Mr. BOSCO. Thank you, Mr. Chairman. And it is a pleasure to be down here in your home bailiwick.

Mr. Beall, I am interested in one question that I have asked a number of people at our hearings in Washington and that is that another way of maximizing our highway money is to use it efficiently. I get the impression, especially up my way which is the north coast of California that a lot of red tape gets involved anytime you go to build anything.

I broke the ground for the Cloverdale bypass eight years ago and that is the only shovel of ground that has ever been lifted on that bypass, even though for most of that time we have had the money to do the project. But there is all kinds of anthropological things and rerouting and citizens' lawsuits and rare flowers and endangered species and weapons and you name it. And this might be an exaggerated case.

But how much of the money that is proportioned to the highway system gets spent in extraneous matters that really do not go into building these systems?

Mr. BEALL. I don't know exactly in terms of the state system. You could probably ask Mr. Best that question. But I know in terms of our Measure A program, we were able to reduce the overhead costs by hiring private consultant engineers—getting them involved in designing the facilities. I think doing things in a fast track process is an appropriate thing to do. The state environmental regulations are just as good or better than the Federal environment regulations. I think if there was some kind of a merger of the two, it would probably ease timeliness on our projects.

Mr. BOSCO. That is what I was wondering about in terms of the reauthorization that we are doing now. Should we consider a way of allowing states that have good protective laws to go their own course and not have to duplicate Federal regulations?

Mr. BEALL. I think in California that would be very easy thing to do, given the fact that we have such strong laws here in our own state and the cities support that. In fact, there was a resolution adopted to that effect by the League of California Cities and the League of California Cities then presented it to the National League of Cities last year and they adopted it, as well; to streamline the process and look at ways of doing things in a package approach, rather than a sequential construct. These documents were all drafted sequentially. If you kind of package them together and take a better project planning approach to building the project, you get the projects done faster.

The California voters also responded to that in Proposition 111. There is a clause that requires Caltrans to reduce the overhead on new projects to 20 percent. So there is some reflection of the concern of the voters in that regard, also.

Mr. BOSCO. I have noticed that in another project we are building up our way that there is all kinds of studies that have been required, but they do not start on the second one until they finish the first one. I have asked them why don't you just do all of these at once because they are not dependent sequentially. It seems to that there is a lot for them to do to speed up in this process.

Do you find that the Federal or the State requirements are duplicative for the most part?

Mr. BEALL. A lot of cases, yes.

Mr. BOSCO. And yet you have to go through the ritual of doing each?

Mr. BEALL. A lot of boiler plating. I think we could do a better job. Also, I might point out that we could save money. That is the important thing.

The Traffic Authority that is building the project in Santa Clara County has a value engineering process that we instituted in this

county for the highway projects that we are building. Thus far, we managed to—by having the engineers look at the particular projects—cut $100 million dollars out of our project costs and provide the same congestion relief for less money. So you can do things to save money and speed up the time lines.

Caltrans is taking a lot of steps, also, to deal with that problem. I think we have to have support from the Federal Government to do that, as well.

Mr. BOSCO. Thank you very much, Mr. Beall.

Mr. MINETA. Congresswoman Boxer?

Mrs. BOXER. Mr. Chairman, I have no questions. I just wanted to comment that your eight steps for post-interstate transportation policy were very clear and concise and to the point. I, for one, greatly appreciate the effort you put into your testimony.

Mr. MINETA. Thank you very much, Mr. Beall, for being here on behalf of the League of California Cities and the National League of Cities.

At this time, I would like to call forward a panel from the Metropolitan Transportation Commission; the Honorable Rod Diridon, Chairman of the Metropolitan Transportation Commission as well as Supervisor of Santa Clara County; the Honorable Steve Weir, Vice Chairman of the Metropolitan Transportation Commission and Supervisor of Contra Costa County; the Honorable Tom Nolan, Commissioner of the Metropolitan Transportation Commission as well as Supervisor San Mateo County; and William Hein, Deputy Executive Director of the Metropolitan Transportation Commission.

Supervisor Diridon, we have your statement as Chairman of the Metropolitan Transportation Commission. That will be made a part of the record. You may proceed in your own fashion at this point.

TESTIMONY OF ROD DIRIDON, CHAIRMAN OF THE METROPOLITAN TRANSPORTATION SUBCOMMITTEE AND SUPERVISOR, SANTA CLARA COUNTY; STEVE WEIR, VICE CHAIRMAN, METROPOLITAN TRANSPORTATION COMMISSION AND SUPERVISOR, CONTRA COSTA COUNTY, ACCOMPANIED BY TOM NOLAN, COMMISSIONER, METROPOLITAN TRANSPORTATION COMMISSION AND SUPERVISOR, SAN MATEO COUNTY

Mr. DIRIDON. Mr. Chairman, I would like to welcome you first to your home. It is nice to have you here in Santa Clara County that cares for you and appreciates all that you do back there in Washington for us.

Mr. MINETA. When I hear about the 90 degree heat and the humidity back in DC, it is always good to be back here.

Mr. DIRIDON. Well, we have saved the best for you and we are proud to have you back there for us and happy to have you back home.

We welcome the rest of the members of the committee and I do so as the Chair of the Santa Clara County Transit Committee Board of Supervisors as well as the Chair of MTC.

Joining the panel today and you have already introduced them are Steve Weir, Vice Chair of the Commission; Tom Nolan, the Commissioner from San Mateo County; and Bob Stockwell will be

speaking to you later on from the Golden Gate Bridge Authority. Bob is a Commissioner, also. You have heard from Jim Beall who is also a Commissioner. Larry Dahms, our Executive Director will be speaking to you as a member of the panel of the Transit Operative Coordinating Council. And we are pleased to have Bill Hein here, the Deputy Director as technical support for the panel.

I will summarize my testimony, Mr. Chairman, in order that you will have more time for questions. I know also that your schedule is very tight today. I, as a consequence, will try to be brief.

I do want to stress to the panel something that they are already are very aware of because we are all Californians here, and that is on June 5th the people of California made a very profound statement that they want to fix the problems here in not only in Santa Clara Valley, but throughout the State of California as it pertains to traffic congestion and air pollution.

The nine cent gas tax increase and the two rail bond measures will create nearly $20 billion over the next ten years. That was a declaration of great profundity. That should put us in a position to allow us to move ahead with your help to solve the transportation problems within the near term future.

I should stress that many of the counties—In fact, all of the major counties of the Bay Area also adopted at least one and some of them two, half cent sales tax to create local funds to solve the same problems.

That combination of local and state funding makes two legs of the three legged stool that is a transportation funding platform. As you know, a three legged stool without a leg doesn't stand up. And the leg we lack now is the Federal leg and that is the leg that you are in the process now of constructing.

The declaration of the people of California, really to me and the members of MTC, said something very profound about shifting priorities. We know that we must comply with the Clean Air Requirements. We know also that the people of California are concerned about clean air. Indeed, air pollution kills people. It isn't just for fun that we are complying with the Clean Air Standards, its because air pollution kills people.

So we are working now very hard through the MTC and the Air Board at the regional level to come into compliance with the state and Federal air pollution laws. A major effort in that compliance process is to build transit systems; to transition now from an all highway national transportation programs to a multi-modal transportation program.

We in this region are ready. We have a master plan that speaks very firmly to both highways and mass transportation. We are ready to meet that challenge and are anxious for you to assist us in doing so.

The expiration of the Surface Transportation Act which was adopted in 1987 is an ideal opportunity to craft that conversion of priority. We ask you to keep in mind the requirements for mass transportation and for complying with the Air Pollution laws both at the state and Federal levels as you go through that conversion process.

We have been involved in the national coalitions that have been crafting advisory programs for you. We are very pleased to have

been very active members of those programs, especially the Transportation Alternative Group, the TAG, which not only MTC has been involved with, but I am very proud to have been involved with as the Chair of the National Association of Counties Mass Transportation and Railroads Committee.

We do support the programs being proposed by the TAG especially the following: An increase in the Federal gas tax. It is tough in an election year to talk about this, but I think the people of California are willing. They have proven it. An increase in the federal gas tax dedicated to sustaining and improving the nation's transportation system. I stress again that the gas tax should be increased for transit and highways; not for deficit reduction.

The second point is the flexible use of Federal transportation funds in a predictable, formula-based funding distribution program. This is to ensure, to the extent feasible, that we would have an equitable distribution between the metropolitan and rural systems. We are sensitive to the needs of the rural states.

I recall your question to Jim before me and I understand that you are going to have to deal with the Senate that has a vast number of the members from rural states. So we are very concerned that the rural systems maintain priority.

We are also concerned about the literal reduction of the ability to do business in terms of the national economy by the congestion that is occurring now within our metropolitan areas.

The third point is the establishment of emphasis on a system, not just individual projects, and to address congestion and access problems with uniform Federal matching requirements for investments in both expanded highway and transit facilities. Please let me elaborate there just momentarily.

What we are concerned about is that right now there is a distinct bias towards highway projects because the highway match is much lower than transit match. With a 50 percent transit match, the highway match is anywhere from 25 to as low as 12 or 13 percent on occasion. We need to have a consistent matching requirement so that we can make local decisions based on the adaptability and the effectiveness of the mode; not on what federal money is least expense.

In MTC, the systems approach is very important. We concentrate on that and we have been successful in developing a master plan that does stress a systems approach. We see the melding of the interrelationships of highways, local roads and the various kinds of transit into an overall system in the region. We have that master plan adopted now. It has been adopted not only by MTC, but all of our support organizations. The difficulty is now in funding that master plan because we do not have the Federal assistance that was projected.

I would like to touch a moment on the so-called Denver Accord. This is the agreement that was recently reached in Denver by many of the local government elements of the TAG. We support it and we would ask you to support it also.

The substance of the Denver Accord is quite similar to the ideas embodied in the MTC principles. The essential argument is that we must shift away from state-dominated, state-owned, freeway-only approach to transportation.

The Accord statement illustrates the facts from the Secretary of Transportation's biannual report to Congress that other forms of transportation are grossly under-funded. In urban areas, it will often be more cost effective to invest in transit ways than freeways. Our state, however, with their lingering rural bias—actually, many states, not just California, but many states with their lingering rural bias fail to recognize or address this real need for total transportation systems. We urge Congress to rectify that myopia.

I would like to also stress our regional master plan. We are very proud in the Metropolitan Transportation Commission to have a master plan to transportation which we embodied in our Resolution Number 1876. That has been supported by all 24 transit systems and by all of our nine counties and our 97 cities.

That master plan for transportation has elements of highway expansion, highway improvements and four BART extensions. We have our nine light rail extensions and busway expansions. That is a consensus plan now by the whole region. That means when we go back to Washington, as Congressman Mineta knows, we have all of the Congress members of this region advocating for one project at a time.

Our priority projects now before Congress are the Tasman Project in Santa Clara County, the extension of the Guadalupe Corridor line both east and west; east into the east San Jose area which will interconnect with BART eventually; west into the Sunnyvale and Mountain View Caltrans system.

The other regional priority is the BART extension in four different directions but most immediately, we are looking forward to the BART extension to the San Francisco Airport from Daley City.

We are looking for Caltrans extension in downtown San Francisco and the upgrade of that system, generally.

That is a $2.4 billion program; 70.6 percent is paid for by the state or local governments. Let me say that once again because I think that is terribly important for you to be able to carry back to your colleagues to remind them that we are doing our share in California and looking for your help at the federal level for only a minor portion.

Our master plan is a $2.4 billion program of which 70.6 percent is paid for by local or state sources. Only 29.4 percent is paid for by the Federal Government. That is far different than the minimums that the Secretary of Transportation has indicated—50/50. As a consequence, we ask for potentially less than our share, but indeed we have a much higher and more crisis level need in both terms of our congestion and the air pollution problems.

Again, that master plan is adopted and supported by all of our local governments, all of our transit agencies. It was very difficult to craft that consensus. It will only stay together if we are able to receive the assistance from you in terms of that matching share.

That matching share is lynch pin of that consensus. Without the leverage that comes through our regional and public planning organizations, which MTC is for transportation, we cannot maintain that consensus. As a consequence, your help is vitally required.

I would like to conclude by indicating that we would like to assist you in achieving a redirection of the federal highway and transit program to serve the interests of all parties. We would like

to achieve this by using metropolitan and rural program requirements to stimulate new thinking by existing institutions. Those existing institutions are in place in the metropolitan planning organizations across the United States.

If you require assistance approach and require those regional metropolitan planning organizations to come together with a systems plan before funding is released, then we will indeed accomplish an awful lot more for your dollars and for the local dollars that are being expended and the systems will inter-relate and inter-connect in a way that they have not in the past.

We are ready here in the Bay Area and in Santa Clara County. We have worked together, we have the master plan system approach and we are ready now to assist you in pursuing Federal funding that accomplishes those objectives.

We know in California, because we are a little bit ahead of the rest of the nation in terms of rural matching funds as well as the systems planning approach, will be a proving ground for the new Federal transportation policy and in the post-interstate period.

We look forward to working with you at what is sure to be a historic point in the development of the transportation system of this country.

In closing, I would like to note that I do have testimony from several different other organizations. I will not read that testimony to you. I would like to summarize the Santa Clara County testimony, if I might, by indicating that your funding of the Guadalupe Corridor project has been quite helpful and very much appreciated.

We have opened the northern portion of that project now—about a half of the project is open. We expected 2,000 to 5,000 riders per day. In the month of April, which is our last full month of ridership figures, we carried 9,370 riders a day far in excess of the 2,000 to 5,000 expected by the engineers.

We open the next link of that system—and this is an invitation to you all—on August 17th. At that time, our great Congressman Norman Mineta will be our guest speaker. We will have an opportunity to see the trolleys reach another two and a half miles south to the first suburban areas of the valley, the residential areas. We invite you all to be with us on that day. It is at 10:00 a.m. on August 17th.

Beyond that, our portion of that regional master plan includes three light rail extensions, a BART extension, the Caltrans extension upgrade and busway expansion. You will see that in the written testimony.

We have representatives of the senior community here today. The Seniors Can Act Together. Herb Goldblum is here. He would like to submit his material into testimony, and I am doing that hereby.

The Sierra Club has also asked that their testimony be submitted into your review. I will do that also. They do represent the Transportation Now Coalition, which has come together in Washington and which I am sure you have heard in your earlier testimony, so I will not elaborate further.

Mr. MINETA. Without objection, those statements will be made a part of the record.

Mr. DIRIDON. Thank you very much, Mr. Chairman.

Now, Mr. Chairman, if you have any questions, we stand ready for those questions; and we appreciate your taking the time to be in San Jose today.

[The prepared statement of Mr. Diridon appears on p. 2580.]

[The prepared statement of Mr. Goldblum appears on p. 2725.]

Mr. MINETA. Thank you very much, Chairman Diridon.

Let me ask Supervisor Weir or Supervisor Nolan if they have any statements to submit.

Mr. WEIR. Thank you, Mr. Chairman. To underscore the regional consensus, although I am from a county that is distant from San Mateo, from Contra Costa County, we stand before unified in the number one project. That is the San Francisco BART Airport extension.

To simply underscore what Chairman Diridon has said, a strong economy and a clean environment have to go hand in hand. You can't have one without the other.

What we need as local metropolitan officials is the flexibility to decide which projects, in terms of both air quality and mobility makes the most sense. So in your postinterstate systems you put together, the flexibility I heard spoken of this morning is absolute paramount if we are going to be able to meet both the desire to the public and that is to move and the desire of all of us to have clean air.

Mr. NOLAN. Thank you, Mr. Chairman and members of the committee. My name is Tom Nolan. I am a member of the Board of Supervisors and also a member of the Commission.

I would like to take a moment, if I may, and hone in one county and what all is going to be for that county.

First of all, I want to thank you, Mr. Chairman, and the Members of the committee for your past and current support for our major project which is the extension of the BART at San Francisco International Airport. The preliminary engineering is already underway for the first of four stations on that project.

We are also appreciative of the Federal support for our Caltrans now in the San Francisco expansion, another major project that will have major implications for an entire system.

Between now and the year 2005, in San Mateo County, we expect that jobs related trips will grow by 20 percent. From this trend, 400,000 to 500,000 each day. An additional 200,000 work trips will be by county residents to and from adjacent counties. Air passenger related trips to and from San Francisco Airport add an additional 100,000 trips per day.

In our county, our major transportation plan has two major components: mass transit is one somebody already mentioned and parts of the airport, which we believe when fully developed in four stages can handle an additional 40,000 people and take them off the freeway.

The other part of it is Caltrans and we have been operating that. The primary part of that is being due to a place where people want to go to—downtown San Francisco. We have grown from 20,000 to 22,000 passengers a day to possibly 60,000 or 700,000 additional passengers—total passengers.

These are major improvements that can affect the quality of life in the peninsula and San Francisco and certainly make major contribution to the area's air quality as well.

In terms of funding our plan, as has been suggested here, every single transportation measure that has been on our ballot for the last ten years has been approved overwhelmingly by the people of the county. Essentially, that includes the two big projects: the BART and the Caltrans. People have affirmed this. I think what we are asking for is the flexibility, as mentioned here, to help us solve our own problems in ways that make sense to us.

I can assure you, Mr. Chairman and members of the committee, that when we went to the people with our Measure A, our transportation sales tax measures, it was a product of considerable compromise. We have 20 cities within San Francisco County and as you know, to get those amendments on the ballot, you have to have a majority of the cities, a majority of the population, plus a majority of supervisors.

We believe that there ought to be three major characteristics of the new interstate program. We think there ought to be in terms of adequacy. We think the program has got to be large enough to provide the needed federal shares to make the local plans.

Second, flexibility has already been mentioned.

The highways in San Mateo County are not an option at all. There will be no additional freeway in San Mateo County, and probably very little participation in new highway improvements in our county, although we do need those as well.

And number three, predictability. That is the ability to plan multi-year contracts. We need to be able to know as far in advance as possible what their federal shares is supposed to be.

Mr. Chairman, we now look forward to working with you on a new partnership that is being forged here and beginning here this morning. Of course, doing that, on behalf of the people of our county, the Bay Area and California and the United States, welcome. Thank you.

Mr. MINETA. Thank you very much, Tom. We have always had good support from the Bay Area delegation on this, and especially from Congressman Miller in the 7th District, as well as Tom Lantos in the 11th District as well.

Chairman Anderson?

Mr. ANDERSON. Thank you, Mr. Chairman.

Supervisor Diridon, in your written testimony, you mention the local sales taxes for transportation improvements which have been adopted by a number of counties in the San Francisco Bay Area including Santa Clara County. Now, many of the Bay Area's transit operators use the funds raised by these local taxes to contribute more local funds than is required by law for federal transit grants.

Now, the administration has indicated their support for the continuation of this over-matching. From your testimony today, do I understand that you would oppose over-matching for transit assistance?

Mr. DIRIDON. Mr. Chairman, let me first compliment Happy upon being re-elected to the Long Beach City Counsel.

Secondly, I would like to stress that we over-match in the Bay Area because first of all, we have been able to gain the local sup-

port to pursue the over-match and as required in order to be able to obtain a competitive advantage for the very, very meager funds that are currently available at the Federal level for mass transportation. But we don't think it is fair. We think——

Mr. ANDERSON. For transit and highway assistance, both of them?

Mr. DIRIDON. For either. If the Federal Government is going to provide funding on a project by project basis, they ought to do so equitably and they ought to do so adequately. Our first point—Mr. Nolan and I both stressed—is that we need an adequate source of funds, and then we don't need to talk about over-match. We can talk about funding projects that are ready to be funded because they are good projects. Rather, what we have now is a very time consuming process compounded by the Urban Mass Transportation Administration resulting in delay after delay after delay in the review process.

I hate to take the time, but I should share with you what has been a horror story in terms of our transportation planning process in this region. It takes us at least ten years from the time we begin the first study on a transit project to the time that the project is approved for construction. That means the project is going to increase in cost, just by the virtue of inflation, not to mention the other problems that occur when you elongate a program such as the erosion of public confidence.

That means that you are going to increase the cost by at least 50 percent on that project. Yet, in every one of our major transit projects, it has taken at least ten years to the point of receiving the grant approval; not construction. The grant approval.

It took 11 years for the Guadalupe border project with Congressman Mineta and Edwards pushing very hard the whole time. The reason is because there isn't enough funding for mass transportation. As a consequence, there is not enough staffing in the Urban and Mass Transportation Administration to do the reviews.

In addition to that, there is a tendency for that organization to delay reviews as a way of not having to pass the money out or not having to say no.

So we need more funding for mass transportation. If you had the additional funding, then we wouldn't have to be talking about pitting one local organization against the other in a manner that requires over-match. We would instead be talking about, "Well, this is the best project in the nation. We will fund that project. And we will fund it according to current Federal regulations which says a 75 percent federal match is appropriate. Not 50 percent." Your law—Congress' law says 75 percent Federal match is appropriate on transit projects.

So indeed, we don't like the idea of over-match. We have had to resort to it simply because it is the only way we can obtain the Federal assistance, but we would certainly look forward to a time when the funding would be more adequate and we wouldn't have to put one local organization against the other in a manner which is really destructive to the local consensus.

Mr. ANDERSON. Do you concur any recommendations made by Caltrans that has recently issued report on the reorganization of the Federal highway and transit programs?

Mr. DIRIDON. No. As you would expect, Caltrans is looking forward to a reauthorization which would continue to see the funds flow through the states. We believe that that is a step which has been archaic in the process. The metropolitan areas have developed very good master plans that are systems oriented to solve problems within metropolitan areas. Indeed, the problem is focussed on metropolitan areas. It is either congestion within a metropolitan area or access problems in the rural areas getting into and out of the metropolitan areas.

The state is primarily interested and concerned about their state highway systems which are not necessarily oriented for metropolitan problem solving. As a consequence, we diverge from the State Department of Transportation proposals in terms of rather having those funds come through your metropolitan planning organizations. They are your creatures. You required them. We have now established them. We have made the metropolitan planning organizations in the Bay areas very strong in terms of consensus building ability. Now, we would like you to use it.

Mr. ANDERSON. Thank you, Mr. Chairman.

Mr. MINETA. Mr. Chairman, on page four of your statement, you refer to the Denver Accord and you talk about the state domination as it relates to two things. One, rural areas. Secondly, more weighted towards highways than it is towards mass transit.

First of all, legislatures generally are dominated by state legislatures. Probably more dominated by rural interests than they are by the urban because there are just more of them than there are urban interests.

Secondly, as it relates to highways versus mass transit, highways have a trust fund. Mass transit has a mass transit account within the highway trust fund. So you have got an imbalance right there.

You say, "We urge Congress to rectify this myopia." How would you envision us doing that?

Mr. DIRIDON. Mr. Chairman, there would be two responses to that. The first is that which is presented in the paper and that is local flexibility. Send us the funds. Don't tell us how we must use it.

Mr. MINETA. Let me stop you on that one score. If we do increase flexibility into the program, it again points to something else you mentioned and that is a strong COG, an MTC type of organization. But I bet we can count on one hand the number of strong COG's there are in this country. Why should we then say, "Yes. We will go for flexibility," and allow regional councils of government to make the determination on what the mix is going to be when there aren't very many strong COG's across the country.

Mr. DIRIDON. Mr. Chairman, there may be two responses to that. The first would be to use the strong COG's where they are.

Mr. MINETA. There are a half dozen in the whole country.

Mr. DIRIDON. Where they do exist, though, you could use them.

Mr. MINETA. We do right now.

Mr. DIRIDON. Pardon me?

Mr. MINETA. We do right now.

Mr. DIRIDON. The problem is that there isn't enough funding to accomplish the objectives that we are master planning. So it comes back to funding.

The other response, Mr. Chairman, is to require that the COG's become strong. If the funding isn't available to a local jurisdiction, unless they have a strong COG, then indeed we will see strong COG's cropping up all over the place. That is what we thought back when this was originally established—the MPO process was originally established. That is what we thought was going to occur.

We indeed took your instructions to heart, and created a metropolitan transportation commission as the control point for funding entering this region. Indeed, by the adoption of Resolution of 1876 by MTC and support of that resolution now by virtually every local jurisdiction, we are able to accomplish that objective for you, so that we don't bother you with extraneous requests, but come to you annually with one request from this region.

If you required that as a prerequisite for funding any projects in other areas, indeed, other areas would have strong COG's. Unfortunately, there are times in other areas, when a strong, local jurisdiction will end-run the COG. Once that happens, then the COG will have no more power. Because then, in order for any local jurisdiction to succeed, they would have to be doing the same end run process.

Mr. MINETA. Let me ask, has the Metropolitan Transportation Commission had a chance to view the report by Caltrans relative to the reauthorization of the Federal highway and mass transit programs?

Mr. DIRIDON. Mr. Chairman, we have just received it. The staff has begun the review process. It will have to come up through the committees at MTC and the Commission eventually will adopt a policy statement.

Mr. MINETA. Very well. We would be very much interested to hear your reaction to it because there are a number of things in there, especially as it relates to transit that make a very, very big difference. I think frankly, we will be questioning Mr. Best about this because I think it will have an adverse impact on the state of California.

The Honorable Norman Y. Mineta
Chairman, Subcommittee on Surface Transportation
Committee on Transportation and Public Works
U.S. House of Representatives
Washington, DC 20515

Dear Chairman Mineta:

At the Subcommittee's July 5th field hearing in San Jose, you asked the Metropolitan Transportation Commission to provide a response to the Caltrans document entitled "Addressing Modern Transportation Challenges - California's Recommendations for a Post-Interstate National surface Transportation Program." We are pleased to submit our analysis of the Caltrans report.

To begin with, it should be understood that this document reflects the recommendations of the California Department of Transportation; it is not a consensus position of transportation interests in California. We do, however, agree with many of the Caltrans recommendations and are viewing the report as a good starting point for future discussions within the state.

Our analysis of Caltrans' Post-Interstate proposals leaves us with two distinct and conflicting impressions: first, of a program that seeks to address today's transportation problems through new partnerships and fresh thinking; or second, of a package of ideas that perpetuates state dominance, modal biases and fragmentation. We believe that this gap between the vision and the reality of the program structure undermines the very good intentions behind the Caltrans approach.

In the Executive Summary of the report, Caltrans outlines five objectives for the Post-Interstate program and postulates that its recommendations provide a program structure that meets these objectives. We are in complete agreement on the objectives, but believe that in every case, Caltrans has included elements which serve to undermine the programs to meet these objectives. A review of each of the five objectives follows.

- <u>Preserve our existing national infrastructure investment</u>

  The Caltrans proposal splits funding 50/50% between the Highway System of National Significance and the FAST-Highways program. No increase in user fees is proposed, but a drawdown of the trust fund balance is presumed. While this program would continue to fully fund interstate needs in non-urban areas, an examination of the Highway Performance Monitoring System shows that existing funds from all sources have funded less than half of urban infrastructure requirements.

In addition, the Transit System of National Significance proposal would divert 15% of Urban Mass Transportation funds to routes of national significance and force new rail starts and other urban capital intensive projects to compete for FAST funds in a reduced formula program with transit capital, rehabilitation and operating needs. The Transit program would thus result in less funding being available for infrastructure preservation. In addition, the proposed apportionment of funds to states based on contributions to the federal Mass Transit account would severely penalize states like California and regions like the Bay Area with large investments in transit. These areas do better with the existing Section 9 formula which allocates funds to urbanized areas on a population/service formula.

- Refocus national policies to respond to urban congestion rural access, intermodal connectivity, and air quality, and

- Give priority to projects (regardless of mode) that offer the best solution to each region's transportation problems

Caltrans does a commendable job in outlining the need for a "unique mix of capital and operating strategies to meet current and future transportation objectives including metropolitan congestion relief, rural access improvements, increased intermodalism and preservation of environmental resources." We concur with their recommendation for a systems approach, for corridor level planning and for modal flexibility. However, Caltrans undercuts these basic objectives by including the following restrictions in its HSNS, TSNS, FAST-Highways and FAST Transit programs:

-- Caltrans proposes to allow transit projects to be eligible in HSNS corridors. However, the structure for investing in transit in these corridors virtually guarantees that the funds will be spent on highways instead. First, HSNS projects are funded 85% federal/15% state and local while TSNS projects are 25-50% federal/75-50% state and local. Elsewhere in the report Caltrans acknowledges the need to equalize matching rates. Second, funds can be spent on highway projects in an HSNS corridor by right and presumption, but transit projects must meet at least 112-17 criteria. While the criteria may be useful, evaluative tools, if they are employed it should be to guide choice between modes, rather than to bias choice toward the highway alternative.

-- There is no guarantee that the states will in fact focus on such issues as congestion, access, connectivity and air quality as total discretion is left to the states as to involving regions, as to allocating funds between metropolitan and rural areas, and as to addressing air quality. Funding needs to be linked instead with the existing "3C" planning process and with a management systems approach, perhaps through the implementation of congestion management and pavement management requirements.

While Caltrans endorses the existing "3C" cooperative planning process, and suggests that a cooperative partnership involving states and localities, their proposal leaves all the flexibility and all the control over purse strings at the state level. The need is to provide predictable sources of funding to drive regional system planning, rather than to rely as Caltrans does on each state's "unique allocation process." The 3C process must be coupled to funding rather than decoupled, and a flexible formula allocation should be provided.

Instead, Caltrans proposes a "hold harmless" based on FY 1991 FAU and FAS funds for non-state systems only, preserving categorical differentiation and removing local autonomy by reserving final programming to the state level.

- <u>Provide accountability to Congress for achieving these national objectives</u>

  We generally endorse the Caltrans approach to defining performance standards on the national system. This approach allows Congress and FHWA to set mobility objectives for a limited HSNS and should allow state and local partners to devise flexible approaches to meeting those objectives, including such approaches as arterial improvements, high occupancy vehicle lanes, traffic operation systems and transit improvements. The performance standards would allow monitoring of investments while maximizing the opportunity to resolve problems of access and congestion. These standards must be accompanied however with flexibility, truly equalized matching rates and criteria, and predictable urban formula allocations for the process to work.

Caltrans has done well in providing a coherent philosophy for the Post-Interstate era. It is correct in stating that we must not "default to the assumptions, institutional relationships and programs that shaped the policies of three decades ago." Caltrans has gone a long way in providing fresh thinking, as has the National Transportation Policy. We believe, however, that there is a gap between philosophy and the delivery program that still remains to be resolved. Throughout the report, Caltrans stresses that metropolitan traffic and congestion problems need to be solved at the regional/subregional level, and suggests heightened involvement of local and regional agencies in the planning process. The bottom line for solving congestion problems is that a guaranteed stable funding formula needs to be established at the regional level. Only by the creation of this kind of budget discipline can the planning process be made to work. We look forward to working with you and the Subcommittee to formulate legislation which can merge good intent with practical tools to meet the Post-Interstate challenge.

Sincerely,

Rod Diridon
Chair

RD:HD:lw:7626p
cc: Bob Best, Caltrans

Mr. MINETA. Mr. Diridon, in your testimony, you specifically note MTC's support of an increase in the Federal gasoline tax for transportation improvements. If such an increase is enacted, what is to prevent an unwilling administration from not spending the funds that would be collected?

We found that to be the case now; and now we have some $10 billion of gas tax revenues that have been collected for Federal aid highway programs and mass transit. They are sitting there idling away in what I call OMB's version of a Swiss bank account.

Mr. DIRIDON. Yes, we realize, Mr. Chairman. You and I have talked at length about the so-called sequestering process that is occurring with the trust funds for highways transit and airports; and are concerned about it. We would hope that in any reauthorization bill you would require that the trust funds not be retained as an artificial budget balancing device, but rather that the trust funds be spent down.

If a local jurisdiction tends to bankroll funds instead of spending funds, then that local jurisdictions should lose those funds over a period of time. I don't think it is healthy—either for you to put money in the bank that isn't spent. Tax dollars are given to you, I think, for programs. And it isn't healthy for us, certainly, because we need those funds to accomplish objectives.

So we hope that an element of the reauthorization bill would be the requirement that the Executive Branch expend the trust funds and only keep those portions which are for projects that have been committed and only for a short period of time.

Mr. MINETA. Congressman Packard.

Mr. PACKARD. Back to the flexibility that you are suggesting, Mr. Supervisor, who would make the determination as to which projects would receive priority monies that would come through under the flexible program?

Would that be at the state level; at the local level with the cities; or would it be some regional planning agency? Who would determine which projects would move forward and which ones would not?

Mr. DIRIDON. Mr. Packard, I think the way we ought to do it is the way we are doing it in this region. The local jurisdictions begin the process. We are a grass roots region. The projects are recommended first by the local jurisdiction.

The local jurisdiction accomplishes the studies in cooperation with MTC. When those studies are completed and the project identifies itself as a priority because it is a good project; it has a low cost per new rider figure and the other kinds of criteria are met. Then that project works through the MTC priority setting process and it becomes then the fundable project for the year. That becomes a project then that we go back and ask for earmarks on or other kinds of assistance that are offered—direct grants in some cases.

The stress there, though, is that it begins with the local jurisdiction requesting the project. If there is more funding provided—when there is more funding providing by your reauthorization, then instead of coming to you with one project at a time, which is our current process because there isn't more funding than for one at a time for this region, then we can come back to you for more

than one project at a time and begin building systems instead of projects.

Mr. PACKARD. In most council of governments—there are certainly many I know—there are imbalances in the voting structure, in the power base, and some small projects or projects in small communities are often left wanting because the power base doesn't really give them what they need and they have no vehicle whereby they can offset the voting block of the more metropolitan areas.

How is that resolved in your situation? How would it be resolved in a flexible plan that you are recommending?

Mr. DIRIDON. Well, first, common sense would indicate to any metropolitan planning organization that they better take care of the little guys or the little guys are going to get them in the end, because you have to maintain that consensus. There are typically more little guys in total than there are big ones. In fact, there are only a few large organizations in any COG. So often times, there is a balance that works out within an MPO, with the little fellow sometimes having a lot more power than the big one.

There should be some requirement for share-back to rural areas. We recognize that. We understand that both in terms of the rural states, as well as the rural jurisdictions in even a state like California, there are an awful lot of votes involved, especially in the U.S. Senate. So we understand that the rural areas are going to have to be guaranteed some amount of funding.

So I would imagine that in your final legislation there will be some declaration that at least a portion of the funds released through an MPO that does represent smaller areas will have to go back to those smaller areas.

Mr. MINETA. Thank you, Mr. Chairman.

Congressman Bosco?

Mr. BOSCO. I have no questions.

Mr. MINETA. Congresswoman Boxer?

Mrs. BOXER. Mr. Chairman, I have one question. The three of you have really been leaders in your own areas and in the environment and your support of transit is proof of that. I also wanted to compliment you in your joint testimony for pointing out your support for the Americans with Disabilities Act and the Clean Air Act.

Many times, when these acts are passed, people in localities express dismay because it does make it a little more difficult; and you did allude to the fact that these mandates can be difficult. I really sympathize with that. As you know, I was a county supervisor for six years. I am very pleased that Supervisors Jocamine and Stockwell are here from my own county. I remember in those days, we were fighting hard against the state mandates that came down. They were always unfunded. We never knew what to do.

I would like to ask all of three of you—because we are under time pressure—just to briefly answer. How big a problem are these mandates coming down? The Clean Air Act and the Americans Disabilities Act. Can you handle what we have done? Do you need special funding to go along with the mandates?

Mr. WEIR. Obviously, special funding to go along with the mandates would be important. The state recognized that when the passage of Proposition 13 took place in the 70's. We need the flexibility to spend what funds we can on the best projects we can.

We also recognize, though, that with the rural county issues, one has to address the broad spectrum of needs. If you force us at a local level to come back to you with a consensus on our projects to take into account the special needs of both air and mobility, we will work in those special interest groups to the best of our ability.

If, however, you allow us to come back—either MTC in this region or some other area—and do in-runs for the major blamerous big projects, all of those side issues will fall off the wagon. We think that in this region, at least, we have addressed mobility for the handicapped. We are now addressing the major issue of clean air. We agree with those goals. Force us at the local level to come to you with a completed package and it will happen.

Mrs. BOXER. Thank you.

Mr. MINETA. Would my colleague yield on that?

Mrs. BOXER. Of course.

Mr. MINETA. Supervisor, you mentioned if there was any mandate under Proposition 13, that it would be picked up by the state, I take it. Is that what you are saying?

Mr. WEIR. Well, that has been the theory of the so-called——

Mr. MINETA. That is what I was going to say. That is the theory, because as I recall, under every bill that comes out of the state legislature, they put a disclaimer saying, "No. This is not a mandate."

So then all they do is shift it to local governments that then have to pick up that cost. So even though it is mandated, if every bill after that comes out saying, "This program is not a mandate to local government," and then you still have to eat that cost, you don't come out ahead on that.

Mr. WEIR. Certainly, it is better in the alternative, and that is mandates without having some funding. We are at least petition the state. I have several hundred thousand dollars in for my operation for the state. We are still waiting for the check if they are in the audience.

Mr. DIRIDON. Well, for Santa Clara County, that price tag is several million dollars that we will never see. We know that. I guess it isn't a perfect world, but at least we should try to make sure that Federal mandates are funded. We understand, of course, that the Federal legislature is a very responsible organization and that you will, of course, legislate that the Federal mandates are funded. At least, you will try, I know.

Barbara, I would like to especially compliment you on the great job you did as the Chairperson of the Regional Bay Area Quality Management District. You were all of our guiding light in terms of how to act as a good regionalist.

Mrs. BOXER. That's very nice. Thank you.

Mr. NOLAN. On that question, I would say that in San Mateo County, we have been before you and before the state legislature on the issues of Americans for Disabled and Air Quality before. It becomes difficult to sometimes put all these values together, but I can assure you that those values are highly held by my Board of Supervisors in our County. I, for one, as a member of our transit district, am willing to accept the challenge to do what we can with it. Of course, we appreciate the fine efforts you made.

Mrs. BOXER. Thanks. Thanks, Don. Thank you all.

Mr. MINETA. Let me thank very much the panel from the Metropolitan Transportation Commission for your input to these deliberations. It is very, very important. Thank you very, very much.

I would now like to call forward a panel made up of the Bay Area Transit Operator Coordinating Council. The panel members will be made up of: Larry Dahms, the Chair of the Bay Area Transit Operator Coordinating Council and the Executive Director of the Metropolitan Transportation Commission; and Howard Goode, Management Analyst for San Mateo County Transit District; Frank Wilson, the General Manager of the Bay Area Rapid Transit District; Carney Campion, the General Manager of the Golden Gate Bridge Highway and Transportation District; Lou Montini, Assistant Director, Santa Clara County Transit District; Vincent Harris, Deputy Director of the Alameda County Transportation Authority; and Ken Stanley, the Director of Planning for the Alameda County Contra Costa Transit District; Ed Harrington, the Deputy Director of Finance for the San Francisco Public Utilities Commission and Municipal Railways.

As I said, one of the reasons for these regional hearings is to get the hands-on experience of folks who have the day to day operational responsibilities for operating our system. So it is a pleasure to have all of you here.

Mr. Dahms, your testimony will made a part of the record. Why don't you lead off. Proceed in your own fashion, sir.

TESTIMONY OF LARRY DAHMS, CHAIRMAN OF BAY AREA TRANSIT OPERATOR COORDINATING COUNCIL AND EXECUTIVE DIRECTOR OF THE METROPOLITAN TRANSPORTATION COMMISSION, ACCOMPANIED BY HOWARD GOODE, MANAGEMENT ANALYST FOR SAN MATEO COUNTY TRANSIT DISTRICT; FRANK WILSON, GENERAL MANAGER OF THE BAY AREA RAPID TRANSIT DISTRICT; CARNEY CAMPION, GENERAL MANAGER, GOLDEN GATE BRIDGE HIGHWAY AND TRANSPORATION DISTRICT; VINCENT HARRIS, DEPUTY DIRECTOR; KEN STANLEY, DIRECTOR OF PLANNING FOR THE ALAMEDA COUNTY CONTRA COSTA TRANSIT DISTRICT; ED HARRINGTON, DEPUTY DIRECTOR OF FINANCE FOR THE SAN FRANCISCO PUBLIC UTILITIES COMMISSION AND MUNICIPAL RAILWAYS; AND LOU MONTINI, ASSISTANT DIRECTOR OF THE SANTA CLARA COUNTY TRANSPORTATION AGENCY

Mr. DAHMS. Thank you, Mr. Chairman and members of the committee for the opportunity.

I think the main point to be made by all who are sitting before you is that the Transit Operator Coordinating Council exists and works in the Bay Area and represents a diverse group of transit operations.

I am appearing before you today as Chair of TOCC. As a group, our Bay Area Transit Operator Network serves over 1.5 million people a day, with an annual operating budget of about $750 million. You have named the people here and have noted that Mr. Montini is here in Mr. Reading's stead.

We are happy to be before you and to offer our teamwork presentation. First, I would like to stress our support for the reauthoriza-

tion principles that are embodies in the T-2000 program developed by the American Public Transit Association which many of us had an opportunity to make input to, particularly including the call for the increase in gasoline user fees for public transportation.

I have attached that statement of principles to the testimony. These principles underscore the need for dedicated, stable sources of funding for transit in our nation's cities and clearly state the national interest of both transit operations, transit capital rehabilitation. Note in the principles, as in the testimony of almost every national organization, support for more flexible Federal funding, a point already discussed at some length this morning. Before deferring to my transit partners for their remarks, let me explore briefly this concept. Why is flexibility important? How can flexibility be achieved? How can flexibility become inflexible?

Briefly, in that order, consider these answers:

Why is flexibility important?

A flexible federal program is essential if other Federal objectives are to be given adequate consideration. Land use integration, air quality mitigation, multi-model integration, increased local funding and cost effective project investments are all encouraged if state and local decisions are free of overly rigid federal funding categories and regulations. Often improvements are not even feasible unless there is an opportunity for local tradeoffs to be made.

How can flexibility be achieved?

We propose a geographic allocation of formula funds dedicated to building and operating metropolitan and rural access systems.

The existing state-local decision process described in federal law provides the basis for determining how planning and funding decisions would be made. With slight modification, this existing law could impose a system discipline while providing sufficient flexibility to encourage the integration of freeways, local arterial, transit and major terminals. Where a well established MPO exists, it could assume a leadership role in the state-local partnership.

In other cases, the state could play the leadership role so long as it focused on the metropolitan or rural access system. The federal government had demonstrated its ability to get all states to focus on the delivery of a single system—the interstate. There is every reason to believe that a similar focus on metropolitan and rural access system development can be achieved now. In this case, however, an extended partnership and more flexibility are required.

How can flexibility become inflexible?

There are traps to be avoided, as follows:

The move to create a National Highway System of 150,000 miles can lead to a State/Federal preoccupation with a single part of the system. While this may have been required to complete the Interstate System, it threatens a meaningful response to congestion in urban areas where a multi-faceted attack is required.

Perpetuation of anti-transit bias manifested in alternatives analysis requirements, differing matching ratios and other regulations directed only at transit acts also to undermine flexibility.

These Federal impediments to flexibility are exaggerated by State Transportation Departments still wedded to a freeway as always the best solution. These impediments must be countered by

Congress if we are to benefit from new thinking needed to meet new transportation challenges.

Perhaps I should pause just for a moment there to illustrate that point. You ask us to review—you asked Mr. Diridon, my Chairman, earlier to review the state proposals for reauthorization. While we haven't had a chance to go through the document thoroughly, parts of it does serve to illustrate the concern we have about having all of our eggs in the state decision basket. Because while there are some very good ideas presented in the California report—and I don't want to take away from the good ideas—there are some concerns.

There is a place where the national highway system versus the state system—an appeal is made in that document for common matching funds so that the cheap federal dollars as is put in that report will not unduly push state and local officials towards projects which may not be the most cost effective projects.

Yet on the other hand, two or three pages later in the same report, the point is made that transit projects should have to have 50 to 75 percent local funding. It seems to me there is a major contradiction there relative to the question of the cheap federal dollars pushing the program to the state freeway solution as opposed to the transit solution when there are times the transit solution will be a better choice.

Further, there is not a long list of hurdles to get over in that report relative to selecting three freeway solution. Yet, there is a list of about a dozen such hurdles on the transit side that would have to be overcome if the transit choice is to be made. That is just the kind of federal prejudicing that we think we will need to do away with and not perpetuate.

So in conclusion, a gap does exists between the lofty goals expressed in the Secretary's national transportation policy and similar statement by our own California Administration versus specific implementation proposals. In this brief examination of the concept of flexibility, we suggest that it is a worthy strategy in search of achieving other Federal objectives, so long as care is taken to follow through to the logical conclusion.

We appreciate the support your committee can give in matching worthy objectives with strong implementation incentives.

Thank you very much for this opportunity to discuss these concepts.

Now, looking to each direction, the panelists, I think have some short comments to make.

[The prepared statement of Mr. Dahms appears on p. 2572.]

Mr. MINETA. Fine. If the panelists would please proceed?

Mr. Goode, do you want to start at your end?

Mr. GOODE. I would simply underscore three words that Supervisor Nolan made to you earlier in terms of objectives for your program. Those were adequacy, flexibility and predictability.

Adequacy is bound up with your definition of the Federal role in the program. We have labored long and hard in this region in an effort to help you to find that.

Flexibility you have heard a lot about. It is important. It needs to be an inner growth component of the new program.

Finally, the predictability from the point of view of an implementing agency is vital; that if we are to embark upon and deliver in a timely and cost effective manner, and major projects, we have to be able to depend upon the funding sources.

Thank you.

Mr. STANLEY. Good morning. I am the Assistant General Manager of the Alameda Contra Costa Transit District which is the east based transit system of the third largest transit system in the state of California.

I would like to focus my few remarks in support of the increased Federal transit operating assistance which is one of those predictable things that we would like to see.

I think it is very clear to everyone in attendance that we have a pollution problem and a congestion problem of severe magnitude. There is also a growing consensus that building more highways won't solve the problem. People won't put up with the cost of neighborhood destruction and increased air pollution that automobile oriented proposals carry.

But if transit is to carry a greater share of the burden, then the availability of transit must be improved. The product offered must indeed provide an alternative to driving alone. The voters of California have shown themselves willing to pay for improved transit as the June elections have demonstrated.

I believe the Federal Government also has a role to play and that is as Federal Operating Assistance. Unfortunately, over the past decade, the Federal Government has cut back funds for transit operations. Every year, there are attempts to eliminate this funding altogether.

Faced with increasing demands for improved schools, police and fire protection, the local governments have been reluctant to increase support for transit. Most new funding mechanisms for transit, such as the local transaction sales taxes or the state-wide rail bonds have been primarily for capital projects; not operating funds. This is understandable since it is easier to vote for something you could see and feel. Yet, the keys to encouraging more transit use is expanded coverage and more frequent service, and these require more operating funds.

Frequency is consistently cited as the number one factor that impacts an individual's decision whether to use transit or not or to drive alone. Frequency is the key to transit's competitiveness with the automobile.

Some would argue that funding local transit operations is not a Federal role. However, air pollution and lost productivity due to grid lock are of national significance. Since improved transit is clearly a necessary part of the solution, it should be funded accordingly. Furthermore, the Federal Government does subsidize transit's competitor, the automobile, through tax benefits that encourage free parking and the Federal Aid Urban and other highway programs that fund local streets and highways.

In closing, we don't think that transit's role should be judged on its current market share, but its potential market share. Others have demonstrated that the potential is enormous. That it will never be realized without increased transit operating funds. Californians have shown their willingness to pay their share to reduced

air pollution congestion. The Federal Government should increase its contribution to solving these problems with more operating funds.

Mr. HARRINGTON. Good morning, Congressmen. Ed Harrington from the City of San Francisco, Deputy General Manager.

You have heard these two words a lot this morning. I will be brief. Again, the same thing: flexibility and predictability and as it applies to the City of San Francisco.

The City has a transit first policy. It has had one for 20 years now. We make up about two percent of the population of the state of California. However, the mini railway of San Francisco carries more than 20 percent of all transit writers in California on a daily basis. So we have the absolutely most transit dependent ridership in the western United States.

Clearly, our issues about flexibility would mean that you would allow us to take the funds that you want to give and allow us to use it for transit; not transportation, freeways and those types of things. Even the few freeways we have, as you know, Mother Nature is helping us knock down. So what we have left in San Francisco is a transit and transit first policy.

The second point is predictability. We are now doing seven-year plans for the state of California. We just passed our second half cent sales tax in San Francisco. To pass that, we gave the voters a 20-year plan for capital spending in San Francisco. To be able to do a 20-year plan, we had to make gross assumptions about the level of support that you would be giving us.

The only kind of support that we could even possibly count on is our Section 9 formula spending. It is the only thing that gives us credit for actually carrying people.

The Section 3 Discretionary part is a nice idea, but it can do a variety of things for a variety of people and it has no direct connection with actually being in the transit business and being successful in the transit business like we are in San Francisco.

So again, what we are looking for is some flexibility, but also the predictability to be able to plan for our needs for the future.

Thank you.

Mr. MINETA. Mr. Wilson.

Mr. WILSON. Mr. Chairman, I thought I would be the first speaker to wish you a good afternoon, but apparently I am not. So good morning.

On behalf of the BART organization and our broadbase constituency here in Northern California, I thank you for giving us the opportunity to assist you in laying the foundation in the framework for the transport systems that will take us into the 21st Century.

As architects of the strategies that will define the character of this country's urban centers, you will directly and dramatically impact life as it is lived at the local level.

Public transit operating organizations such as BART are in a very real sense your contractors. We will have to execute—in other words, build and operate—the plans which you will be setting in the Surface Transportation Act.

This local/federal participation or partnership, which has evolved over many years, should be acknowledged, strengthened

and made permanent. This, we believe is best accomplished by: supporting regional choice in local decision-making; providing financial energy in the proper form to perform the functions; encouraging creativity in generating solutions to mobility challenges; and permitting public transit to use all of its inherent advantages to achieve National priorities such as environmental preservation, economic development, elderly and disabled mobility, business opportunity for the disenfranchised and a more rational energy utilization.

These critical objectives can best be achieved in the new transportation laws if they feature new rules and regulations that are as state-of-the-art as the technologies that they will invest in.

We strongly urge you to insure that the authorization legislation permits public transit to be used as a vehicle for proactive management of both the regional and national agenda and not merely equip us for a post crisis act of coping with a hopeless situation.

We need your financial and political support to be on the leading edge of service delivery and urban vitalization and not on the lagging end of stop-gap survival efforts.

The pressures are both immense and immediate here in the Bay area. We enjoy a very vibrant economy. We are experiencing sustained growth in population. In fact, one out of every ten jobs created in this country will be created here.

BART, as a principal transit carrier, is experiencing expanding ridership and growing demands for service. If there needs to be an example of local determination within the overall framework of local Federal participation, it must be the Bay area. The voters in this metropolitan area, and indeed the state, have spoken clearly once again. By approving new gas taxes and the sale of bonds for rail system development, we now bring billions to the bargaining table and more than our fair share to the partnership.

Funding for the four BART Extension Projects is nearly the reverse of the traditional 75 percent Federal, 25 percent local commitment. Our constituents have taxed themselves to build transit systems. They have taxed themselves to operate transit systems. At times, it appears we have invented the notion of self help. It is now time to look to our partner for help and that help can come in many forms, in addition to more money.

Two such measures would take the form of enlightened techniques for programs management and administration.

First, the establishment of a multi-year contract authority. This would provide an opportunity to fund new rail starts in a way which would permit more Federal money to be applied more rapidly and efficiently than is currently possible under full funding contract procedures which invite earmarking, hoarding and delayed application of Federal funding.

We have developed such a proposal and wish to share that with the committee and would like to submit that as part of our testimony here this morning. We believe that it represents an example of a more forward thinking, aggressive and creative technique that allows flexibility in program implementation.

The second measure calls for a more modern and sensitive Federal program that eliminates the artificial classification of transit systems into categories with very hard boundaries.

The current approach differentiates between so-called "old" system such as New York and the new system such as BART. We oppose such fragmentation of the UMTA program. In terms of age, BART sits between the "old" systems and the new. We have significant extension needs and expansion needs. At the same time, if we do not embark on an aggressive rehabilitation and rebuilding program now, we will suffer the same deterioration the older systems have already experienced. If there must be New Starts and the Rail Modernization categories, then we believe all operators must remain eligible for funding from both sources, as their needs dictate.

These are just two examples of how progressive lawmaking can lead to new ways to solve some old problems.

In summary, if we as transit system operators are to be successful in building the transport systems that the Congressional architects envision, then we will need solid partners and not silent partners.

At this time, I would like to indulge, Mr. Chairman, in an effort to move the agenda along. We have a statement from Erlene DeMarcus, the Vice President of BART Board of Directors, which I would like to enter into the record if you print.

[The prepared statement of Mr. Wilson appears on p. 2721.]

Mr. MINETA. Without objection, sure.

[The prepared statement of Mr. DeMarcus appears on p. 2578.]

Mr. MINETA. Mr. Montini.

Mr. MONTINI. Good morning. I am Lou Montini, Assistant Director of the Santa Clara County Transportation Agency. We are the operator of the County's bus and light rail system. We also have responsibility for the County highway and expressway system, as well as the three general aviation airports in Santa Clara County.

We in Santa Clara County have a growing mass transit system consisting of over 500 buses and the soon to be completed 20-mile light rail system. The ridership on both systems have been increasing steadily and have reached record levels in the last few months. We will open the next two-mile segment of the light rail line on August 17th and the entire south line next summer. We are in the final stage of a federal alternative analysis and draft DIS for the Tasman Quarter which is our next highest priority new rail project.

The Federal capital and operating assistance provided by Congress have proven valuable to the development and continued growth of public mass transit in this County and in the San Francisco Bay region.

As stated by Supervisor Diridon and others in earlier testimony, we must continue a strong funding partnership between the Federal, State and Local governments. The funding commitments for transit should increase by all three levels in the coming years if we, as a nation, are to achieve both air quality and congestion goals.

We in Santa Clara County and in California have raised local and state taxes to finance much needed transit improvements. So must the Federal Government increase the national gasoline tax to meet the growing transportation of the future.

Finally, both the federal and state clean air goals and the American Disabilities Act will probably require transit operators to increase their level of operating and capital budgets in order to respond to and effectively address these federal and state mandates. It is vital that the Congress provide the necessary new funds to transit providers to help implement these policies.

That concludes my comments.

Thank you.

Mr. HARRIS. Good morning, Mr. Chairman.

My name is Vincent Harris. I am the Deputy Director for the Alameda County Transportation Authority. I am afraid we have somewhat of a mistaken identity in the Bay Area as we are not AC Transit. However, we do share with the transit operators as the Transportation Authority does provide an order of magnitude $7 million to AC Transit.

I come to you today on behalf of our governing board. As you are aware, Alameda County is one of the 11 self help counties in California. The Alameda County Transportation Authority administers this voter approved half cent sales tax for otherwise unprogrammed transportation improvements in Alameda County. The projects in the program were identified as the most essential in the County. Our program includes rail projects, local streets and roads, and major Interstate highway facilities.

Alameda County's program, which will amount to approximately $1 billion in a 15-year period is aimed at correcting currently perceived deficiencies. It does not provide for transportation needs.

In addition, we find that these voter approved sales tax funds are inadequate to meet our full transportation expenditure plan commitments. The recent statewide transportation measures will offer some assistance in this regard. However, here again, the available funding will be heavily dependent on continued Federal support and will only start to address current needs.

In Alameda County, there are approximately 40 miles of designated interstate routes that have received no interstate constructing funds and barely enough Interstate 4R funds to maintain the existing inadequate roadways. It is these routes of national importance and other neglected "missing urban links" that need continued Federal assistance to meet future needs in this growing region. We refer to "neglected" links in the total system as the emphasis on interstate completion did result in shortages elsewhere.

We have two examples in Alameda County of routes that are of national importance, but which have received insufficient funding to match their needs. These routes are I-880 and I-238.

I-880, the Nimitz Freeway, was designated under Section 139(a) of Title 23. We have a sales tax commitment for improvements on 13 of the 35 miles of this facility in the amount of $220 million. However, we have identified a total need on our portion of I-880 amounting to approximately $458 million in 1990 dollars. The increases on this route and other sales tax projects are due to such matters as increases in the scopes of work to meet Federal requirements and to the need to rehabilitate the existing roadways. For instance, our commitment on I-880 was for freeway widening. We now find that we may be required to build a high occupancy vehi-

cle facility and we find that much of the existing plant is worn out and needs replacing.

We do not have a commitment to I-238, as similarly designated 139(a) system inclusion. However, I-238 connects I-580 and I-880 and, because of truck restrictions in the City of Oakland, serves all interstate truck traffic entering the Bar Area from Central Valley over I-580. Correcting the deficiencies on this major interstate truck facility will cost over $100 million. And there are no state or local funds currently available for this work.

Accordingly, we urge reauthorization and increase of the Federal gas tax for transportation purposes for the following reasons:

First, to meet the growing needs for this region.

Secondly, to protect and enhance the existing Federal transportation investment.

Thirdly, to assist and reward local efforts aimed at maintaining and upgrading routes of national importance.

Finally, to provide for missing links in the transportation system.

Our presentation notes some of the problems in Alameda County. However, as the Bay Area grapples with air quality, transportation and land use issues, we are well aware that the solutions must be worked up in a reasonable setting. Our comments could well apply to any or all of the Bay Area counties.

In closing, I repeat that the Alameda County Transportation Authority strongly support reauthorization and increasing the Federal gas tax for transportation purposes.

[The prepared statement of Mr. Harris appears on p. 2592.]

Mr. MINETA. Thank you very much, Mr. Harris. Again, would you, for my own purpose, clarify. You are the Deputy Director.

Mr. HARRIS. Yes. I am the Deputy Director for the Alameda County Transportation Authority. That is the implementation body for the Measure B4 Program, the Half Cent Sales Measure in Alameda County.

Mr. MINETA. Okay. Mr. Stanley, you are with AC Transit.

Mr. STANLEY. Right. From the Alameda County Contra Costa Transit.

Mr. MINETA. Absolutely. Okay. That is where I got confused. Thank you very, very much.

Chairman Anderson.

Mr. ANDERSON. Thank you, Mr. Chairman. I think my question would be directed to almost anyone there. My question is: Do you have any specific projections of the costs of complying with the new amendments to the Clean Air Act? Do you favor any aspects of the Senate passed legislation over our house pass or vice versa?

I happen to be on the conferees that will be meeting on this when we get back to Washington. I would like to have your attitudes, your views on the new proposal of the Clean Air Act.

Mr. DAHMS. Mr. Chairman, it is difficult to answer the question as to what the costs might be. To begin with, the air quality standards in state law are more stringent than the air quality standards in Federal law. My guess is that any cost associated with the Federal law would be less than what we would be required to invest in in any case in the state law.

The relevance of the Air Quality legislation as it plays out with transportation, to my way of thinking, is to go back with the theme we have been playing so strongly here as the one of flexibility.

The existing categorical funding programs limit the kinds of choices we can make relative to providing mobility; in effect, preclude us from having as meaningful a set of trade-offs and developing a mobility plan that will be responsive to the Air Quality requirements as we think we need. So one of the very important reasons for flexibility is to be able to take the air quality demands into consideration from the very outset as we develop our plans.

Relative to the Senate versus the House versions, I think that we had a little more ability to input the House version and probably lean a little more towards the House version.

Mr. ANDERSON. Thank you. You might check into that and if you have any specific version, let us know because I know I would like to have some guidance on it.

Mr. DAHMS. Well, we have taken a position that we can send to you, sir.

Mr. ANDERSON. Thank you.

Thank you, Mr. Chairman.

Mr. MINETA. Mr. Dahms, in your statement on page three, you mention with slight modification the existing state/local decision process might be changed. So I would like to ask you: What is the nature of that slight modification?

Mr. DAHMS. Well, it is probably the understatement of the morning.

Mr. MINETA. That is what I was afraid of.

Mr. DAHMS. I do think, though, that there is reference in everyone's discussions to the so-called 3C process that was created by Federal Highway Act some 25 or so years ago. It is that process that came out of Federal law that led to the evolution of organizations like ours and led them to exist.

To my way of thinking, that process establishes a partnership between state and local government. I think it works well in this state. It may not be seen as slight to other people, but it seems slight to me. That is that our problem—that the state, in effect, has insufficient flexibility. And the state, in effect, does not have the right focus when it comes to fighting the problem of congestion.

That focus has to be—there has to be a metropolitan system response. You can find all sorts of evidence to suggest that, but let me just give you one example. Secretary Skinner and his policy speaks a lot to the promise of the Intelligent Vehicle Highway System. Note that "system" is the last word in IVHS. That system in each metro area is going to be the metropolitan system. That is where the congestion is. It is not going to be the state highway system or the interstate highway system. As far as the congestion and urban areas is concerned, it has to be a metropolitan system.

So the slight modification, I think we need, is we need a requirement for a metropolitan system—an integrated system, one that integrates freeways, arterials, transit and terminals. Not one that is burdened by the ownership restraints that now stand in the way where 100 cities and nine counties and 20-some transit operators in the state all view their parts from an ownership perspective in this region reinforced by the kinds of categorical funding that we now

have. Instead, we need to have a categorical program, geographic distribution of funds to the metropolitan system and then the state concerns and the local concerns need to be worked out in a 3C process as they have in the past, but with this new focus.

Mr. MINETA. Let me ask: If we are trying to deal with an integrated systems approach dealing with metropolitan concerns, as well as rural, it seems to me what we have is metropolitan congestion, but from a rural perspective a need for rural access. If you utilize the 3C process—as I recall, the 3C process was for those areas of 50,000 or more in population.

So what do we do with rural areas if we use the 3C as a model—when that really applies to 50,000 or more in excess and yet we want to talk about rural access system development as well as metropolitan congestion system development?

Mr. DAHMS. Well, I think it is clear, Mr. Chairman, that there is two different kinds of problems and they require different answers.

Mr. MINETA. If I could interject; if you also say we need another category, it seems to me that we are going away from categories and trying to talk about flexibility, rather than create another category.

Mr. DAHMS. Well, the basic structure that we have recommended is the continuation of the support for the rehabilitation of the interstate. That that investment has to be preserved. That would be one category. There would be two other basic categories: a metro system category and a rural access category.

Now the metro system category, I think, falls neatly within the 3C process for the purpose of making the decisions about what are the most cost effective investments, assuming we have the flexibility to make those decisions.

In the rural access category, I think that for the most part, that still would be—the leadership would still by and large be with state officials, hopefully with local opportunity to participate with the state.

Mr. MINETA. Would the rural system have a mix of highway and transit?

Mr. DAHMS. I would think so. We have in our northern counties, particularly Sonoma and Napa counties are really quite rural yet. And yet, they do have transit needs. So I think even in rural counties, the transit program has to be taken into account, especially when you see things like the kinds of problems Greyhound is having now. There is clearly a problem of rural isolation.

My Commission has public hearings every year, according to state law in those northern counties. It is an amazing revelation to my commissioners every year to find out how many people are limited to one or two or three trips per month and then usually to some sort of medical facility. That does happen in rural Bay Area as it happens in the rural nation.

Mr. MINETA. But your MTC does not extend to those northern counties like in the case of—is it Fort Bragg that is being cut off from Greyhound service? They are not within your jurisdiction. So as I understand it, Fort Bragg's only recourse is to the Public Utilities Commission, rather than to let's say MTC for any kind of back up.

Mr. DAHMS. That's correct. And, of course—to an enlightened state approach, as well.

Mr. MINETA. California has done very well under the Section 3 Discretionary program, at least, partly because it over-matches Federal funds. That is, we provide more than the 25 percent local match required by Federal law.

What is your opinion as practice that should be encouraged in Reauthorization bill?

Mr. DAHMS. You might get slightly different answers from different participants here before you. It is not something we take a hard line position on. Mr. Diridon, our Chairman, earlier noted that it has been part of our strategy, but nonetheless noted concerns with it.

I think that, in essence, in our strategy, given circumstances as they now exist, what we have attempted to do is to isolate those projects that we would seek Federal funding for; and therefore be subjected to the more exhaustive regulations on those projects we isolated for. So in terms of our larger package, we have been able to accept the over-match requirement.

But if I could speak for the moment, and the San Francisco Municipal Railway, ten years ago when we did our analysis of what it takes to sustain the transit plan in this region, it was in the order of the magnitude of $100 million a year that it would require to sustain the plan. At that time, the combination of Section 9 plus the match was about sufficient to sustain the capital plan.

In the last decade, the erosion of Section 9 has been such that it now only provides enough to sustain half the plan. Therefore, if that lower threshold were to continue, it would mean that we are going to have to raise additional local monies.

So on that part of the program, over-matching is certainly not something that we would advocate. I think we have essentially bought in by practice to over-matching on the rail program in order to secure discretionary grants.

If I could look at that from another direction again, I use the example of expressing some disagreement with our friends at Caltrans on their state proposal where they would have 50 to 75 percent match for transit projects; and yet, only 25 percent for highway projects. We don't think that that sort of thing is going to promote the kind of intelligent decisions that we should be making. So if there is going to be an over-match requirement——

I guess the basic bottom line is that whatever that matching is, it ought to be the same across programs, so it does not distort the kinds of decisions we make.

Mr. MINETA. As you know that Section 9 funds come from the General Fund and Section 3 from the Trust Fund monies, so that has been part of the reasons for that diminishing Section 9 pot. If we were to increase the authorized amounts to come from Section 9, subject to the appropriations process, that may still not be possible to increase it.

On the other hand, if we say that that funding ought to come from Trust Fund monies, I am not sure what adverse impact that would have either.

Mr. DAHMS. It is a little easier for us than it is for you to support the APTA proposal to significantly increase Trust Fund monies from the gas tax.

Mr. MINETA. Of course, APTA is also talking about the 18 cent increase in gasoline tax—or 17 percent—7 cents. I'm sorry. It is ARTBA that is talking about 18 cents on the highway side.

Mr. DAHMS. Well, we will take a compromise between the two.

Mr. MINETA. If I could ask the members of the panel: How would you restructure the alternative analysis problem? Well, maybe they got into it with maybe Mr. Diridon's response.

Although, maybe this is something, Mr. Dahms, that you might be able to respond for the record. How would you restructure the alternative analysis process so that transit projects are not delayed or blocked by an unnecessarily cumbersome planning process?

I think this is something that Mr. Bosco was getting at; something that all of us on the panel are interested in, because of the time and money it takes.

Mr. DAHMS. Well, I think for openers, we have to go back to the basic principals. The alternative analysis starts with a good reason. That is to promote good projects. It is much like the environmental processes intended to make sure that we mitigate the environment as we create mobility improvements. The problem is that as these things develop, we seem to lose sight of their original purpose.

It seems to me that we would be much better served to return to the basic planning program; have the kind of flexible funding that we need; have some basic requirements to be met for any project selection, rather than load up the requirements on certain, isolated project which is what happens now particularly with alternative analysis.

So instead of it really serving its really useful purpose, it seems to be—as Mr. Diridon pointed out before, the way it translates here, it seems to be a strategy for delay instead of a strategy for selecting the best alternatives.

Mr. MINETA. How would you envision structuring a highway and transit bill, so that the Federal Government could make a determination whether a state entity or a regional entity where a strong MPO exists is best able to assume a leadership role in metropolitan area transportation decision-making?

Mr. DAHMS. Well, it seems to me two things would happen. Again, if the Federal requirement were simply that there must be a good system plan—as I understand it, the Federal Highway Administration is talking about certain elements of a good system plan. And that the three-seat process—that partnership is required according to the current rules to develop that plan, then water will seek its own level.

In those regions were the regional organization has the ability to take the leadership, they will. Where they don't have that ability, the states will then take that leadership and it is still a partnership plan.

Secondly, if we were to focus on a metropolitan system plan, as I think we should, then I think you would probably see the state legislature start to modify to some degree the membership of organizations like mine. Probably you would see a stronger state partici-

pation in memberships like mine if that sort of responsibility were clearly laid in its lap.

Mr. MINETA. Thank you.

Congressman Packard.

Mr. PACKARD. Just one question, Mr. Chairman. As transit operators, what do you see as your most serious problem in implementing the Americans with Disability Act?

Mr. HARRINGTON. If I may speak for the Muni-Railway, ours may be a little bit different from other ones here today.

As you know, the Muni-Railway has probably more modes of transportation than any of the transit agencies in the United States. We have the cable car. We have trolley buses. We have diesel buses. We have light rail vehicles. And we have a wide air transit system.

We are going to have specific problems with the definitions of train lining and single cars and needs for getting people on and off of vehicles when they mix with regular transportation on the streets.

If you have been in San Francisco, you realize that our light rail systems goes undergoes, in trains underground. It goes above ground. And it is single cars that go out to different parts of San Francisco. Those types of things were not really taken into consideration in some of the wording that finally came out of the legislation from my point of view.

So we have protected some historic vehicles that have specific needs. We still are going to have to do a variety of things to try to have people with certain mobility problems be able to not mix with street traffic when our trains come up from under ground and disperse to different parts of San Francisco. That is probably our biggest problem is going to be trying to meet the equipment needs in the timeframe that you have mandated for us.

Mr. PACKARD. Is the funding portion of that problem your most serious problem?

Mr. HARRINGTON. Yes.

Mr. PACKARD. Will that require different authorization or separate authorization that what we have already done?

Mr. HARRINGTON. What it will probably require, actually, is something that UMTA is working on right now. The light rail vehicles that we have right now are Boeing vehicles that only San Francisco and Boston ever purchased and they are not working in Boston any more.

If UMTA agrees to a shorter life and we are able to replace those vehicles earlier than otherwise envisioned, we could get vehicles that would have the different accessibility systems that we need.

Even with that, though, we are going to have problems on our streets with wheelchairs and cars mixing in mixed traffic. And that will be an issue for us regardless of what vehicles we have.

Mr. PACKARD. The districts represented here are significantly short of retrofitting their vehicles with facilities. Most of your district should be pretty well along in that area; is that true?

Thank you Mr. Chairman.

Mr. Chairman.

Mr. MINETA. Thank you very much, Mr. Packard.

Mr. Wilson, let me ask very quickly. You talked about the problems of the old systems versus—like New York and newer systems like BART.

I am wondering whether or not we have a similar problem as it relates to highway programs with let's say the 4R Program versus new capital improvements. How do we address that issue then as it relates to a system like BART that sort of falls in between?

Mr. WILSON. The observation that we are trying to bring into focus is the fact that BART really isn't a new system. At 18 years old, when you look at the time lines for major retrofits or major rehabilitation of say, rolling stock, rails cars, you are looking at seven years which would put us out at 25 years.

I think the philosophy that UMTA has been using is that they did not participate in the initial investment of building the system. The system could access rehabilitation funds. Fortunately, BART was—fortunately or unfortunately—not a beneficiary for federal funds initially. So at this point, we have access to both categories.

Our question is: Do we need to continue this artificial boundary? And if we are looking to more flexibility, let those decisions be made locally, whether expanding systems or whether in fact, it is more critical given the resources available to stabilize the infrastructure that is in place. We are just calling that to your attention.

With respect to San Francisco, you can look at that situation, I think, in a more greater degree of severity. The larger infrastructure which is much older, they, too, need to face the same types of situations.

Looking across the country at the Atlanta systems, in that category, you are going to be facing that issue. I think it is important not to structure a new law with new constraints or hurdles that would essentially let the program and the way the program is defined dictate the way the systems actually function at the local level.

Mr. MINETA. Combining New Rail Starts and Raid Mod categories would not solve the problem? They may be exacerbated?

Mr. WILSON. I am not certain that the funding needs to be combined to solve the problem. I think there is recognition that there is multi needs, a multi array of needs that the systems have, especially in let's say in the Bay Area and California where we are building new systems and in the case of BART needs to stabilize an existing infrastructure.

So whether or not you try to solve the problem through creation of categories, or you solve the problem by letting the regional decision-making body decide where the resources needs to flow, I think is a major issue. We are opting for the flexibility of deciding where the funds go.

Mr. MINETA. Let me thank the panel very, very much. As transit operators, of course, you are very key to what we are trying to do in the form of legislation. You are at the other end of the legislative pipeline trying to make sense out of what we do and to try to make things operate at the "street level." So your input into this process is very, very important.

So I appreciate your being here to enlighten us in terms of what your own experience is under the present law and what kinds of

improvements you would like to see us make in that post-interstate era.

Again, thank you very, very much for your being here.

I would now like to call on Robert K. Best, the Director of the California Department of Transportation.

Following Mr. Best's presentation, the subcommittee will be taking a short break for lunch.

That is not an admonition to you, Mr. Best, to you to keep it short, however.

Mr. BEST. Are you going to buy us a nice lunch?

Mr. MINETA. I am going to buy lunch.

Mr. BEST. Good.

Mr. MINETA. Wherever that might; whatever that might be.

Mr. Best, your statement will be made a part of the record and so if you go ahead and introduce your colleague and proceed in your own fashion.

TESTIMONY OF ROBERT K. BEST, DIRECTOR OF THE CALIFORNIA DEPARTMENT OF TRANSPORTATION, ACCOMPANIED BY CARL WILLIAMS, ASSISTANT DIRECTOR FOR FEDERAL FISCAL PLANNING FOR THE CALIFORNIA DEPARTMENT OF TRANSPORTATION

Mr. BEST. Thank you, Mr. Chairman. With me today is Mr. Carl Williams, Assistant Director for Federal Fiscal Planning for the California Department of Transportation.

In addition to my statement which references the booklet "Addressing Modern Transportation Challenges" which I know Members of the committee have had access to. We would like that included in the record as part of the statement.

Mr. MINETA. Without objection, it is so ordered.

Mr. BEST. Thank you, Mr. Chairman.

We appreciate the opportunity in recognizing the seriousness of the events that we are going through here in this reauthorization to be working with a committee that is as dedicated and knowledgeable in this particular area as your subcommittee, Mr. Chairman, and the Members who are experts in the transportation field to put in perspective the wide variety of issues and challenges that we are facing in this reauthorization.

We have tried to put together a presentation for the committee that is a little bit unusual in the sense that rather than just putting forth an advocacy document that would seek the maximum amount of money and the greatest deal for California, we have looked for those kinds of things that are of critical importance to California and have attempted to work with a broad-based group and put together what is a form of a compromised program, but still addresses the critical needs of California but also recognize some of the critical concerns that others may have as well.

I think we have learned some things in this process that will be interesting to the committee. Our process has been going on for over two and a half years. We participated in the AASHTO 20–20 process that this committee is well aware of. I met with a number of states through that process.

Our own Transportation Commission held public meetings up and down the state to get the input from a wide variety of people throughout the state of California.

We have participated in smaller state coalitions, the Crescent Coalition compared of like-minded states. We have had a number of meetings with states in a coalition referred to as the Bread Basket Coalition which is primarily rural western states to discuss with them the ideas that were coming out of the California process and to get their reactions to those ideas.

We initiated a strategic planning process in California called California Transportation Directions, pulling together interest groups outside of the transportation community and asked them what has been missing in the transportation picture; what has been wrong with the priorities that have been used; and what do the people that sometimes feel disenfranchised from the transportation process think needs to be recognized and considered in transportation legislation.

All of that input led to what we are calling here in California the Transportation Summit process where we, in fact, pulled together under the auspices of the Governor and the Legislature a series of meetings and workshops to try to figure out how to best prepare California for the coming era of transportation.

It probably would have been best for us, Mr. Chairman, if we had already had the reauthorization bill from the Federal level, so that we could work that in. But California's funding crisis didn't allow us to wait and it was necessary for us to move quickly to go forward with the new funding authorization for the state and in doing that, to make a lot of policy decisions with regard to how the state would function in the transportation arena. That was incorporated in some elaborate modifications to California's transportation laws which were validated by the electorate in the adoption of the funding mechanism in Prop's 111 and 108 just a month ago.

So we have come a long way in our process in sorting out what our priorities are.

I would like to mention that one of the biggest problems that we faced, and I think it is one that is going to be a major problem for this committee, was to get the transit and highway communities to work together and to sit down and to say, "How can we work together?" We found a real reluctance both within the state and nationally, to be able to put together a working group where both would participate in a give and take atmosphere and try to come to some sort of mutual understanding as to where one could give for the benefit of the other and the other could give for the benefit of the former.

We found this, a very difficult thing to accomplish. So the recommendations in our report, for example, have not had the full benefit of this type of give and take. We found it necessary to listen to the transit community on one side and then go listen to the highway community on the other side; and then try to synthesize a position between the two that we think would work here in California and would be acceptable for those interest groups.

With that, let me mention a couple of the points in the report and correct the apparent misunderstandings of some of the things

that have been said here this morning with regard to the transit position.

Mr. Diridon said that the state's position was that the state could get all the transit money. I find myself in a similar position with the State Transportation Commission who beats me up because I say that the Regional Transportation Commission should have a greater say and position in the funding decisions; and then the Regional Transportation Commissions come forward and beat me up because I say that the state ought to have a greater role in decision making.

In fact, what we are advocating here is that the transit dollars go through the regional agencies as they have in the past; not through the state as was reported by Mr. Diridon. This is in our report. We find that most transit decisions are focused at the regional or local level; and that the state should be playing a supportive role and not a controlling role with regard to the allocation of dollars in the transit arena.

Mr. Dahms also suggested that we didn't recognize the need for trade-offs between the two systems. In fact, what the report does say is that in the FAST-transit program that we referred to, which is essentially the formula distribution program, that the matching ratio should be identical between transit and highways for exactly the purpose of making sure that we are selecting the best transportation decisions and not chasing the dollars.

When we get into in the transit area Mr. Chairman, is the difficult concept of that discretionary grant program—of having a large, discretionary grant program that doesn't fit into, the equitable allocation of funds. It sits out there by itself. How do you deal with a discretionary grant program in the context of a long term predictable and stable funding at the Federal level so that you can then build on this stability with a long term state and local funding programs—like sales tax measures—that try to commit funds 10- or 20-years in advance.

That is a very, very difficult issue to address and one that we have attempted to deal with in our report on a compromised basis. It says, "The discretionary grant program is most likely going to be continued. It has a very strong political constituency for it and it has some very good reasons for it."

But if we are going to continue it, it should be treated separately because it will require higher matching ratios and other distinctions from the transit programs that can be treated as part of a long term programmable series of funding decisions that fit well within the formula distribution for transit and the formula distribution or the categorical programs on the highway side.

So those are some of the reasons, I think, that we will find the merging of the transit and the highway issues one of the most difficult ones to accommodate. We have found it extremely difficult in our attempts to put something together.

The only other thing I would like to emphasize is that a number of the points you heard this morning in terms of what we are most concerned that this committee should address, the principle points that you find in our report are very, very similar to those you heard this morning. The emphasis on preserving our investment in the existing national infrastructure which is so critical to all of us;

the need to be able to respond to urban congestion and rural access and intermodal connection; and air quality and disadvantaged access issues which are critical national issues, but have to be dealt with individually on a state by state basis in many cases; the need to redirect our effort from moving vehicles to moving people and goods; to focus on the systems concept, rather than a project by project; and have enough flexibility so that we at the local and state level can identify the best solutions given the varying differences that we have around the country and from different areas of the state.

The other area is the creation of these new partnerships. Several of the questions that you have asked and the answers you heard have said that: developing efficient transportation systems must be a partnership approach. It requires the active involvement of Local, State and Federal levels. And it has to be done in a way that brings these partnerships together to address the system on a systems basis and on an intermodal basis; not on mode by mode and jurisdiction by jurisdiction or ownership by ownership basis.

The last thing that hasn't been said today which we think is an important element of a national program is to establish accountability for the Federal program to hold the state and local governments accountable for achieving the kinds of objectives that the Congress sets forth in this national program. We advocate that a strong system of accountability to demonstrate that the states are, in fact, doing what they are supposed to do in order to qualify for the funds should be substituted for detailed federal control or categorical programs. Accountability is there to insure that the federal, state and local agencies are working together and toward the same set of criteria or objectives to deliver the kind of national program that the Congress would envision.

We think we are moving into a new era here. We think it is very timely for California. We have certainly recognized in this state that business as usual is gone; that we have to take different approaches; use our money different; attack our problems differently. We are certainly looking forward to seeing the new federal reauthorization come down the line and the ideas that will be envisioned there through the work of this committee.

Thank you, Mr. Chairman.

[The prepared statement of Mr. Best appears on p. 2492.]

Mr. MINETA. Thank you very much, Mr. Best.

Chairman Anderson?

Mr. ANDERSON. Thank you, Mr. Chairman.

Mr. Best, what percentage of the funds currently available in the mass transit account of the Highway Trust Fund are generated by California; and since California currently receives more than 20 percent of these monies, wouldn't your proposal result in a loss of funds to the state?

Mr. BEST. Yes. We produce, I believe, about 12 percent of those funds and we do receive more than 12 percent of those funds.

The proposal that we have recommended does not specifically say that we would lose the current level of distribution of the transit funds because it doesn't provide specific numbers and formulas. In other words, a lot depends on what formula is used for the distribution of the formula funds; and then what results in terms of

future decisions in terms of granting through the discretionary program.

A lot of California's high return on the transit side come, I believe, through the discretionary program.

Essentially, what we are saying here is: This has to be a compromised program; that the Federal Highway Funds should provide for some transfer of what we call the FAST highway funds to the FAST transit program, so there is an ability to provide needed support for transit where transit solutions are better solutions than highway solutions.

There is a need for a basic equitable funding formula that insures that states receive a fair return on their contributions. While California is undoubtedly in the overall transportation arena going to stay some manner of a donor state, there should be limits on what that is. We believe that within the package that we proposed, even if we were to result in getting a somewhat smaller allocation of the actual transit dollars, that the support for the transit programs in California would be higher and that the overall return to California would be higher than it is now under the currently existing Federal laws.

But you have to look at both sides of the program to see how that works.

Mr. ANDERSON. Well, I would like to have you look at that because the way I figured it—and I was probably wrong was that we could lose under proposal and if we can, I would also like you to contact me, write to me or something and straighten me out on that.

Mr. BEST. We will certainly do that, Mr. Anderson, and give you a much fuller explanation of what is contemplated here.

Mr. ANDERSON. Thank you, Mr. Chairman.

Mr. MINETA. I think part of the problem that I see or at least under this TSNS is that you are saying that 85 percent of the mass transit revenues ought to be distributed on a formula basis?

Mr. BEST. That is correct, Mr. Chairman.

Mr. MINETA. It seems to me, on that basis, we lose as a state. I don't know. I think that is what Chairman Anderson is saying. That we would have to take a look at that formula.

Let me ask, as it relates to road maintenance and bridge maintenance programs, Mr. Best, as to whether or not there ought to be a mandate on those two programs. Should there be some kind of a maintenance program as it relates to road maintenance and bridge maintenance?

Mr. BEST. We believe that for what we refer to as the highway system of national significance in our recommendation, but for whatever eventually becomes the primary designated Federal system, that it is appropriate for the Federal Government to set certain minimum standards with regard to the protection of that investment. There are programs such as pavement maintenance systems and maintenance management systems which have been tested in a number of different states, including in California and have pretty well established in terms of their cost effectiveness—in other words, you keep ahead of your maintenance schedule which in turn reduces your rehabilitation costs or your reconstruction costs down the road, particularly in areas where you don't have

major rebuilding expected because of dramatic growth—in other words, lower growth areas. Some of the higher growth areas, we end up rebuilding our highway facilities because the demands exceed them short of their actual physical life span, but those are certain isolated areas of the country and there is no reason that maintenance management obligations or pavement management obligations wouldn't prove effective there as well.

So we would certainly support that.

Our concern on the maintenance side, Mr. Chairman, is very limited; and I know it is one that you fully appreciate. That is, if we develop an allocation of Federal dollars into the maintenance program, we are concerned about Federal requirements that we have to have five wheels on all of our maintenance vehicles or something like that. So it is more the concern of the administrative overhead that might come; not at all concerned with Congress imposing requirements on us to have effective and efficient maintenance processes in place.

Mr. MINETA. One of the problems I see is that we are very good at capital improvement, doing the initial construction. But in terms of maintenance on a road or a bridge, it seems to me that that part is what gets short-changed. In most instances, those are the responsibilities of the states and localities. I am just wondering whether or not, in light of that, whether or not we should be putting in some kind of requirement that there be on the part of the state and localities a maintenance program.

I look at let's say the Williamsburg Bridge in New York and the Golden Gate Bridge here in San Francisco. Both were built roughly within ten years of each other, I think. One has been maintained pretty well and the other one that has gone to sea. If you were to try to make Williamsburg Bridge falling down rhyme with London Bridge falling down, we could probably have an appropriate ditty of some kind.

I am just wondering whether or not we shouldn't be doing something on that as it relates to local and state governments?

Mr. BEST. Well, from the California perspective, in our statutes and in our programs, the maintenance and rehabilitation are given number one priority. That is one of the reasons we don't have in California a substantial bridge problem. We still do have, just based upon age and functional obsolescence a number of bridge problems, but that wouldn't be covered by a maintenance program.

But again, because that is our number one priority, all I am saying is we agree with you that this is a top priority. It would be of no problem to this state. We would welcome it if the Federal Government set up those kinds of requirements, as well.

Our only concern is that if it turns into a Federal maintenance program, that we then get into that circumstance of having uniform national programs that don't recognize, necessarily, the difference between weather patterns, grade and soil conditions, and everything else that you have when you have to design a maintenance program for the system that you actually have on the ground.

Mr. MINETA. But you do that on initial construction in terms of life cycle costing, et cetera; do you not in terms of the initial of a project?

Mr. BEST. We try to, Mr. Chairman. We have found in some areas that we don't always know everything that we think we know when we build a project and we find that we are not always able to build into a project everything that is needed to minimize the maintenance obligations down the road. It certainly should be an objective.

Again, in terms of having that as a principle, we would support that principle.

Mr. MINETA. Should we increase the requirements in terms of what the state does on inspection programs on the initial construction of a bridge or a highway?

The reason I ask is that it seems to me that we have got some highways that are designed for let's say—I don't know—a design life of let's say 20 years or 15 years and yet, in eight to 12 years, they are crumbling.

Now, is that because we are not getting a seven-sack concrete job or we are getting a seven-sack concrete when we should be getting a ten-sack concrete job?

What is happening on some of these highways where we are not getting design life out of them?

Mr. BEST. I can speak directly to that precise point, Mr. Chairman, by giving an unfortunate reference to Interstate 5 here in California; and the fact that we are experiencing a substantial amount of pavement crumbling in section of Interstate 5. We know why it is happening, but we don't know why what is happening is happening. In other words, we know what is happening—what is doing it. We know that we are pumping the sub-grade out from underneath the pavement. We suspect it is moisture infiltration as one of the major reasons. We also suspect that over-weight trucks with high pressure tires that were not contemplated at the time it was constructed is another part of the reason.

So we suspect that there are a lot of reasons out there. We have a special group and a special monitoring station in place to try to figure out exactly what it is that is causing this deterioration. We do not think at this stage that we even have the answer to that.

We can go down the road and we can actually see the pumping action on the pavement. You can see the fines blowing out along the side of the pavement. You can visually see it occurring, but we don't know why the fines are separating out so that they are subject to pumping. We are not sure what all is contributing to it and why the sub-base is not as stable.

We are also experiencing other areas of reactive aggregates. Reactive aggregates that were very, very good for 10, 12, or 15 years and all of a sudden they became reactive again. Perhaps moisture infiltration has caused it, nevertheless we are seeing deterioration in pavement.

So we have to realize that we don't know everything. Amazing as it all may seem, I guess, we still have a lot to learn in this business. We are in the process of learning it. I think federal mandates that require that we concentrate on this kind of a program to make sure that we are building state of the art facilities at the time we are constructing them and then keeping track of these facilities once they are in operation, identifying maintenance problems and try to stay ahead of them is in everybody's best interests.

Mr. MINETA. But Mr. Best, ever since the Romans at Appian Way have been building roads, I can't understand. Does this mean why we can't design then the kinds of drains on the side of the road to allow the moisture underneath to drain out or whatever it is that we have to do? Why is that such a Herculean task?

Mr. BEST. Well, we have designed drains and we have gone back and retrofitted our roads like I-5 and put drains in along the sides of the roads to drain that moisture out. What we now find is that many of those drains are clogged with the fines out of the aggregate sub-base. So the drains are working, but they are not 100 percent effective. Instead of giving us what we had hoped to be maybe a 70 percent drain, they are giving us a 30 percent drain and they are serving as conduits to carry out some of the fines that may, to a limited extent, be exacerbating the problem.

So the Romans didn't know it all and we don't know it all quite yet, either.

Mr. MINETA. Very well. Thank you very much.

Mr. Packard?

Mr. PACKARD. You made mention, Mr. Best, on your testimony about increased private sector participation. I would be interested on your views on that fairly new concept into our transportation systems that we expect we will see much more of in the next three decades. Tell us how you see that happening and what kind of incentives you are looking at in terms of inviting private sector money.

Mr. BEST. Well, what we found in the reviews that I talked about of two and half years of looking at this problem is when you are in an area that is experiencing rapidly accelerating demands for transportation services, there just flat out is not enough money there to solve all the problems. It just isn't going to be.

We are passing a lot of sales tax measures in this state that you heard referred to. Many of those sales tax measures will offer a billion dollars plus of new revenues in a given county.

We have just passed a state law that will generate $18 billion to $20 billion of additional and new revenues.

Even putting those packages together with an assumption that we think the federal program will continue at least the level that it has been and hopefully include the spend-down of the Federal Highway Trust Fund, we still see shortfalls in California in terms of being able to deliver all of the highly needed transportation improvement.

So as part of our package here in California, we included the option for private investment to encourage private investment to come in to those areas where we provide a mediocre or inadequate level of transportation service, essentially, through our public facilities, but there are no immediate plans nor money to substantially improve them. We are suggesting that an option be available for the private sector to provide additional transportation facilities to meet those needs on a cost recovery basis.

What we have found is that the degree of interest in that is quite high, not only in roads, by the way, but also in rail systems. In looking at providing rail systems through this state privatization program we have the authority in the State Department of Transportation to assist, not with money, but with putting together a

legal authorization to allow a private company to come in and provide a transportation facility.

Within the short term future, I don't believe that we are going to see major relief, particularly not on a nationwide basis from privatization programs. But there are certain key areas where privatization can help us stretch our transportation dollars, so that we could use tax dollars more efficiently. We think privatization in the roadside rest area is an example of that.

We think privatization of certain types of facilities that are high demand facilities; for example, some of the major high cost bridges that are failing or need to be replaced or are functionally inadequate might be better considered to be spot location to be a revenue producing structure—that is toll structures. We have toll bridges in California. Most urban states have toll bridges. It is not a new idea.

Then there is the more dramatic program that California has that includes the ability to develop and implement fully entrepreneurially financed transportation projects. These will be important perhaps in high economic growth areas where the public investment is going to be a drag on the economic growth because it is not going to come along fast enough or within a time frame to support the level of economic growth that that particular area might need.

The private investment to augment those facilities will allow that economic growth to continue. It has a role, I think. We feel very strongly that privatization has a key role in expanding the use of our dollars, making our dollars more effective and in insuring that the public sector doesn't monopolize the transportation arena and then become a drag on economic development in high growth areas.

Mr. PACKARD. Are you recommending that we modify Federal policy in terms of using Federal aid highways to allow private involvement?

Mr. BEST. Yes. We believe there needs to be some modifications. Some of those modifications, for example, would include the ability to privatize some of the collateral facilities on federal aid highways where they are becoming a major drain on us in terms of maintenance and cost to our operational dollars.

Perhaps, as I said, earlier, replacing major structures, major bridges on Federal aid highways would be appropriate for privatization.

Also, on the major privatization projects that we have that would be off Federal systems, many of those would appropriately link to a Federal system; and we need some modifications of Federal policies to ease the linking of those into the Federal systems because there are connection issues.

So yes, there is an area that needs to be seriously addressed in this reauthorization to enable us to go forward with these kinds of investments on a lower cost and more expeditious basis.

Mr. MINETA. Would my colleague yield?

Mr. PACKARD. Of course.

Mr. MINETA. Would that include tolls on existing Federal facilities?

Mr. BEST. We have not specifically proposed tolls on existing—in other words, going back and taking an existing facility and impos-

ing tolls on it other than, of course, the concept, as I said earlier, of critical deficiencies, perhaps like a major bridge.

I do have to introduce something here, Mr. Chairman, that I think is wise for the subcommittee to consider. That is there is a growing movement to consider the use of congestion pricing as an urban mobility tool. That is being fueled out of the Clean Air Act. We have been talking here about the difficulty we have in bringing together the objectives and requirements of Federal laws like the Handicapped Americans Act or the Federal Clear Air Act and melding them into the transportation laws if the laws are not written together to achieve consistent and uniform goals.

The kinds of demand reductions that are being translated out of the Clean Air Act, for example, onto the transportation side—in other words, the implementation of the Clean Air Act is being said that the transportation programs must develop dramatic demand reduction tools in order for the transportation side to be responsive. And that is why you hear people coming around and say, "Don't build new transportation facilities because those promote demand whereas the transportation sectors responsibility to reduce demand." That is very narrow-sighted because frequently new transportation facilities will reduce congestion and reduce air pollution, but you need the demand management program in place to deal with the growth inducing side of it that is of concern.

While many people who spend a lot of time looking at demand management are of the opinion that demand management tools will not achieve the kinds of reductions contemplated as necessary under the Clean Air Act without the introduction of congestion pricing.

I think that this subcommittee should be considering that in terms of how are we going to introduce even a basic, sort of a minimal level of congestion pricing if that is what the Clean Air Act is going to require. If other Federal Transportation laws outlaw the use of congestion pricing on Federal aid facilities what are we left with.

Mr. PACKARD. Is the State of California willing—is Caltrans willing to accommodate joint usage with private sector on a state highway and are you encouraging the same on Federal aid highways where new lanes may be needed or toll lanes may be needed or a raised center, using right of way of state or Federal highways by the private sector?

Do you believe that that can be worked out in some kind of a joint venturing usage?

Mr. BEST. Yes. Mr. Packard, we definitely believe that is a necessity and it also expands to the interlock between other modes of transportation. We have to be able to use our highway rights of way for inter-city rail, MAGLEV trains or other things where they offer us the best opportunity to do that.

We have to look at our transportation corridors as corridors for the movement of people and goods through whatever means we can. This is going to require us to break down some of the rigid rules we have had as to what piece of concrete or what piece of ground can be used for what purpose and who can get on it and who can use it because we are going to need to have the private sector in there and using these facilities.

Just like on the railroads, we are going to find that railroad right of ways is going to have to have public trains running on them and private trains running on the same railroad rights of way. We are going to have to see private investment on private facilities and public facilities, using the same right of way in the roads, as well.

We need that kind of flexibility if we are going to deliver to the people of this country the highest level of transportation services with the limited dollars we are always going to have available.

Mr. PACKARD. Thank you, Mr. Chairman.

Mr. MINETA. Chairman Anderson?

Mr. ANDERSON. Thank you, Mr. Chairman.

Mr. Best, what do you see as a valid role for Caltrans relative to the MPO, the Metropolitan Planning Organizations, in a structured surface transportation program?

Mr. BEST. I think you have just hit, Mr. Anderson, on one of the really critical questions to be addressed in this process. That is how are these decisions going to get made?

Mr. ANDERSON. And what are you going to do after they are made if you didn't have a part in helping make them?

Mr. BEST. That's right. I think I am going to endorse what Mr. Dahms meant to say, but not what he said before this committee. In other words, what Mr. Dahms meant to say was that it is a partnership decision-making process that we have to go through.

The focus on that partnership decision-making process is to get away from this idea of ownership of facilities and ownerships of mode or identification of mode and getting ourselves working on to getting the local governments, the MPO's, the regional planning agencies, the state and the Federal Highway working on producing a system—the best system to provide mobility in that area.

All levels end up being the players. I think the Federal Government with certain guidelines can leave that decision—and this is something Mr. Dahms did say at the end of his remarks—can leave the decision of exactly how to structure that to the state.

I am comfortable here in California with a strong decision-making role from the MPO's, the 3C planning agencies. I think it is essential as we don't need the state saying, "This is the kind of a system we need every place."

We need different systems in San Diego and Los Angeles and the San Francisco Bay Area and Sacramento. Those kinds of systems have to recognize the demographics and the geography and the socio-economic make-up—in these different areas. The focus of this process is the metropolitan planning agencies. Or in California, maybe the congestion management agencies that are being pulled together to make these kinds of decisions.

We are comfortable here in California with having a strong decision-making role in the MPO's and with the state a full player, Mr. Anderson, as a partner in making those decisions as they go forward.

Mr. ANDERSON. But you are not in there now, are you?

Mr. BEST. We are in there.

Mr. ANDERSON. Oh, you are?

Mr. BEST. We are in there through the 3C process. We are a designated member of the congestion management effort. We are a

member of the Metropolitan Transportation Commission. So we are in there and we are part of that process.

There are other states, however, who feel very, strongly and are very concerned about a Federal requirement that would obligate them to pass off part of what has traditionally been a state role to a lower level of government.

I think by setting certain requirements that there be this planning process and let that planning process achieve this break down of the modal isolation and the jurisdictional isolation that we have had in the past, you can leave to the states on an individual basis the way to comply with that Federal mandate.

Mr. ANDERSON. I just want to make sure you are in there; not sufficiently to do the next state-wide picture. Otherwise, they could do something in a metropolitan part of the state that would actually work against what you would be trying to do state-wide.

Mr. BEST. Yes. Mr. Chairman, you are absolutely right. I don't think Mr. Dahms intended to suggest anything to the contrary, other than that the state would certainly be in there and participating and making those decisions to insure that there is a degree of consistency as necessary on a state-wide basis. Also, quite frankly, because the state is a major player as an owner-operator in the metropolitan areas and has to be part of the decision process.

Mr. ANDERSON. Thank you, Mr. Chairman.

Mr. MINETA. Mr. Best, thank you very, very much for your testimony here. I want to thank Mr. Williams for his help over the time. We appreciate also the work of Kathleen Hoffman and your Washington office and the work of Mr. Williams on the Crescent Coalition has been very helpful to us.

So again, thank you very, very much.

Mr. BEST. Thank you, Mr. Chairman.

Mr. MINETA. At this time, the subcommittee will stand in recess until a quarter to 2:00.

[Recess.]

AFTERNOON SESSION

Mr. MINETA. At this time, the Subcommittee on Surface Transportation of the House Committee on Public Works and Transportation would please come to order.

I would like to call a panel made up of Michael Evanhoe, Executive Director of the Golden Triangle Task Force; and Mr. Will Kempton, Executive Director of the Santa Clara County Traffic Authority.

Mr. Evanhoe, Mr. Kempton.

TESTIMONY OF WILL KEMPTON, EXECUTIVE DIRECTOR OF THE SANTA CLARA COUNTY TRAFFIC AUTHORITY

Mr. KEMPTON. Mr. Chairman and members, Will Kempton with the Santa Clara County Traffic Authority. You have a copy of my written testimony, so my comments will be rather summary in nature. Hopefully, recognizing your short time frame, I can keep the time limit very brief.

What we wanted to alert you to in terms of a message of what we call a self-help county which we in Santa Clara as a result of a

November ballot measure in 1984, which authorized a one and a half cents sales tax increment for highway improvements in this county. The improvements were rather unique in the sense that they were all state highways. We raised the ten year sales tax, which expires in April of 1995, will raise nearly a billion dollars for improvements to three state highways in this country, two of which are on the urban system and one of which is on the Federal aid primary system.

We are well along in implementing those improvements, Mr. Chairman. The widening of Route 101 is two-thirds complete, with the remaining third going to construction this summer. Improvements to existing Route 85 are finished and open to traffic. Construction of the new Route 85 freeway—18.5 miles of new freeway in the West Valley corridor is well along.

Largely due to assistance provided by your office, Mr. Chairman, construction on Route 237 will begin this fall and we will see our environmental process concluded later this month. We appreciate your assistance in that effort.

The Measure A program, so-called for its ballot designation, is the first of its kind in the state of California. Currently, there are 14 other counties which have passed sales tax increments for state transportation programs.

To put that in perspective, what we are talking about here in terms of the life of those programs, an additional $11 billion of funding for what would otherwise be state transportation improvements. So it is a significant portion of the dollars that are being provided for transportation work in this state. Much of that money will be invested in the Federal aid highway system, including some interstate highway improvements. And also in transit facilities.

In terms of the post-interstate reauthorization, the Traffic Authority strongly supports what appears to be a universal appeal for flexibility in the development of this new framework for allocating Federal transportation dollars. We would, however, encourage the committee to look at a new concept. That is one of leveraging a higher return on the Federal investment in transportation improvements through the establishment of a local incentive program. Our concept of such a program is similar to one just approved by the voters in the state of California and the state legislature.

The State Local Partnership Program is a matching program that encourages local contributions to state highway and transportation work. That local state partnership program will provide $2 billion over the next ten years to match transportation projects which meet certain criteria, including deliverability requirements. Of course, the program serves to encourage local investments in state transportation projects and obviously, the state matching money is a tremendous asset in helping to defray the cost for local agencies. So a similar matching or grant program at the Federal level would create the same kinds of benefits, and we think would further foster the notion of intergovernmental cooperation.

The last point I want to raise today, Mr. Chairman, deals with the project development process. That is, the time it takes to get a project from start to finish and open to the public for use. The Traffic Authority recognizes and supports the need to meet sound

and reasonable environmental and project development requirements. However, the involvement of some of the regulatory agencies that have responsibility for overseeing that process is sometimes very time consuming. We don't argue with the requirements. What we would suggest is that there be some method of reducing or putting a control on the time that those agencies have for review. Mr. Bosco, in his comments, this morning talked about efficiency. We believe that issues like self certification and efforts to streamline project delivery are very important aspects of making the transportation system operate effectively and certainly, getting project work out to the public who is paying for it.

While the subcommittee may decide not to consider this issue in the reauthorization process, certainly project delivery is an important problem which should be reviewed in the near future.

Mr. Chairman, that completes my testimony. In closing, let me offer the assistance of the authority in working with your staff to further develop any of the comments that I have made today. Certainly, our thanks again to you, Mr. Chairman, for all of your assistance in the conduct of our Measure A work here in Santa Clara County.

[The prepared statement of Mr. Kempton appears on p. 2595.]

Mr. MINETA. Mr. Evanhoe, you want to join Mr. Kempton at the table?

Mr. Packard, if you would go ahead and question Mr. Kempton at this time.

Mr. PACKARD. I must leave. I have got an airplane to catch, but I would, if the Chairman would permit, I would like to go ahead and ask the question now and then I need to be excused.

Mr. Kempton, you suggested that we speed up the process and set deadlines or time benchmarks to be met, rather than eliminating some of the regulatory requirements.

Do you have confidence; and how best can we ensure that we will meet those deadlines? There is a tendency of trying to meet deadlines, but we keep putting them off or delaying.

Mr. KEMPTON. Well, I think Mr. Diridon mentioned today in his testimony—Supervisor Diridon from Santa Clara County—that in some instances, it takes ten years to get a transit project from the planning stages to the start of construction.

Mr. PACKARD. Which is totally unacceptable, no question.

Mr. KEMPTON. I think that much of that is in fact the result of duplicative processes, which if you go a self-certification route, for example, the environmental process can be I think streamlined significantly if you allow the states to use their own processes to satisfy Federal requirements. That is certainly one avenue that is available. But if there are necessary requirements—and we have had discussions with Mr. Mineta on this point—that in many instances, those protections are necessary and those processes should be in place.

If there were a way to provide the regulatory agencies with the staff resources necessary to accomplish the reviews required in a certain amount of time, that would be a very big plus in making the whole project development process more efficient.

Mr. PACKARD. I think we all agree that that is a major, major concern for the long time it takes to move anything—either in the

private sector through government approval and certainly in public sector, as well. The question of how to do is a major problem.

Mr. Chairman, I am sorry but I must go. Thank you very much.

Mr. MINETA. Chairman Anderson.

Mr. ANDERSON. Thank you, Mr. Chairman.

Mr. Kempton, in your testimony, you propose that we look at leveraging a higher return on Federal dollars through the establishment of a local incentive program patterned after Proposition 3 in California.

Can you explain in more detail how this would work?

Mr. KEMPTON. Well, the proposition in California that was just approved by the voters, as I indicated, created a state/local match program. It sets aside a pot of money that is available for local agencies to draw on matching funds which in this particular year, the first year of the program, will be about 15 percent of total project costs. There are a series of criteria set down by the state for eligibility for those matching dollars and those eligibility requirements are primarily aimed at project delivery—the ability to get the work done quickly.

Obviously, for self help counties—and as I indicated, there are 15 of us now in California—we have the dollars and we have, for the most part, projects ready to go. So we are taking advantage of those funds.

Santa Clara County was the largest, single applicant in the state of California for those matching dollars for the first year. The program, as administered by the state of California, makes that money available. For us, it means about $6 million to $8 million to assist us in the conduct of our program.

Mr. ANDERSON. Well, Mr. Kempton, when the current half cent sales tax, as dedicated for highway purposes, expires in 1995, do you expect it to be renewed? If so, what will be the project needs at that time?

Mr. KEMPTON. Well, there are discussions going on at this particular time about the possibility of extending the sales tax or establishing a new sales tax program. My job is to focus on the projects that are before us in the first effort. That is primarily what I am attempting to do. I would say, however, that we have significant needs in Santa Clara County. We have one of the most sophisticated planning processes, I believe, that exists in the country. Our T-2000 and T-2010 efforts which have identified significant transportation needs—some highway, but as move into the next decade, shifting more to transit. Those needs are well documented and if in fact, there is an extension or a new program, those new sales tax revenues can be allocated for those projects that are included on those lists.

Mr. ANDERSON. Thank you, Mr. Chairman.

Mr. MINETA. Mr. Evanhoe, why don't you go ahead and testify at this time?

For the record, Mr. Evanhoe is Executive Director of the Golden Triangle Task Force.

TESTIMONY OF MICHAEL EVANHOE, EXECUTIVE DIRECTOR, GOLDEN TRIANGLE TASK FORCE

Mr. EVANHOE. Thank you, Mr. Congressman. I am Mike Evanhoe. It is a pleasure to be here today.

The subject matter of my testimony is our efforts at local self help.

In 1984, Measure A that Mr. Kempton talked about earlier was passed by the voters in Santa Clara County, establishing the half cent sale effort. But in 1985, the business community working with the government officials determined that just building some new state highway facilities would not be enough; but the way the government operated in Santa Clara County had to make some major changes.

In 1986 and 1987, policies were adopted in the area of growth management, housing and transportation demand management programs.

Where are we six years later since all the discussion started in 1984?

We are today in the form of either ordinance or in policy before the planning commissions of the five member cities of the Golden Triangle Task Force: Palo Alto, Sunnyvale, Mountainview, San Jose and Milpitas, a growth management policy that has a four-area ratio of .35 on an average basis in each community. This will control the outright growth in each one of these communities.

In the housing area, a goal of 65,000 additional dwelling units of urban in-fill on land that was previously zoned commercial or industrial was the target. Six years later, we have 15,000 units identified either through rezoning or actually under construction; an additional 20,000 units under study. We hope to achieve our goal of 65,000 additional dwelling units beyond our general plans of 1986 in urban in-fill. That means giving up precious retail, commercial and industrial land converted to housing near jobs.

In the transportation demand management program, the five cities and the County of Santa Clara are annually funding, through their own local resources, a transportation demand management program to the tune of $1.5 million.

When the ordinances by these five cities are enacted later this year, there will be a framework of a loose, general nature that requires each company with more than 100 employees to have an appointed manager and transportation coordinator to work with the local cities and the county to develop transportation demand management programs. Our goal is to increase ride sharing from the 75 percent participation rate today to 85 percent by the year 2000.

All of these efforts have been done on a local, cooperative effort. We find that the business community, when offered an olive branch in working with the transportation demand management program, worked better than with an ax. So we feel that between the time that we started in 1984 to today, we have made some significant progress at the local level. Our program, coupled with Mr. Kempton's program, goes a long way in showing the citizens and the elected officials in Santa Clara can make headway in reversing unnecessary congestion.

Mr. MINETA. Thank you very much, Mr. Evanhoe.

Chairman Anderson.

Mr. ANDERSON. Yes. Mr. Evanhoe, what can we do to support your efforts in transportation demand management?

Mr. EVANHOE. As you develop new Federal policy in transportation in the coming months, Congressman, we hope that there will be an effort to encourage transportation demand management programs. Oftentimes, at the regional and local level, not enough attention is given to transportation demand management programs. It is necessary to complete the highway system, to develop transit rail and bus services; but we feel that it is a major in development of transportation demand management programs with a little encouragement from the Federal level could go a long way in using those new, mandated HOV lanes on Federal and state projects.

Mr. ANDERSON. Thank you, Mr. Chairman.

Mr. MINETA. Mr. Evanhoe, as I listen to the communities you listed, is there not one community missing in that Task Force that is pretty key in terms of a geographical location? Is Santa Clara a member of the Task Force?

Mr. EVANHOE. Santa Clara dropped out of the Task Force a couple of years ago, Congressman, over the growth control/land use floor area ration issue. We feel, however, with the passage of Prop 111 by the voters of California requiring now on all urbanized counties in the state congestion management planning agencies that we have gone a long way in overcoming the difficulties within our communities. We are, in fact, the first county of the urbanized counties in the state to designate a congestion management planning agency. Our elected officials are now going through the process of identifying the board members and the new congestion management governing board will have its first meeting in early August.

Mr. MINETA. How is that going to be structured here in Santa Clara County?

Mr. EVANHOE. It will have a 12-member governing board. There will be five representatives. We are trying to follow the spirit of the one-man one-vote. So five will be from the City of San Jose; two from the Board of Supervisors, one representing the Board of Supervisors and one representing the Transit District Board of Directors; and five from the other cities of the county on proportional representation.

Mr. MINETA. In your work, how do you go to the employers to deal with let's say car pooling, van pooling or other kinds of demand management programs?

Mr. EVANHOE. We have set up an in-house corporate outreach services department where we have trained specialists that will work with each corporate company to try to tailor programs to their specific needs. Often, we think of the Silicon Valley with acres and acres of parking, but we recently had a company who, in an expansion mode, did not have sufficient parking spaces. There were actually employees fighting in the parking lot over available parking spaces. So we stepped in and helped that company form a parking program and a commute ride-share program to enable them to get better usage of their parking lot and to get more of their employees into van-pooling and car-pooling.

So we think that we have been structuring a program of training and actually going in and tailoring each program to a company's specific needs. We think they are cooperating because they see what has been happening in Southern California, Orange, Riverside, San Bernardino Counties in terms of the new Clean Air Act requirements coming out of California that will require some changes in the way business is handling TDM programs.

Mr. MINETA. What do you see happening to the Golden Triangle Task Force now with the congestion management plan required by Prop 111, et cetera?

Mr. EVANHOE. The Task Force members have voted the congestion agencies to be put in place and all the increments there that the Golden Triangle Task Force would go out of business feeling that a lot of its goals and accomplishments will be taken care of by the congestion management planning agency.

Mr. MINETA. Mr. Kempton, in terms of the work that you are doing with the Traffic Authority, and all the kinds of plans that you come up with, what is the process that you then have to go through to coordinate it with Santa Clara County, Transportation Commission, the State Transportation Commission, State Caltrans, MTC, all the other agencies that have their hands in the pot as it relates to transportation issues.

Mr. KEMPTON. Mr. Chairman, we operate within the framework of existing policies. We work, I think, very effectively with the county in helping to put together a priority list for projects of high priority in this area. We do work with MTC through the county in the development of those lists and also with the State Transportation Commission through the county.

I think our biggest impact in the way we have done the job here is in the relationship that we have built with the Department of Transportation. I think Caltrans expected that we would be a funding agency, simply signing the tax proceeds over to them to do the work. However, they were not able to meet the aggressive schedules that we proposed early on because of staffing limitations, and we put together a public-private partnership involving private consulting engineers in the design of the work. It served to be a very efficient model. It has worked extremely effectively. We are delivering the projects in about half the time that it would have taken if the state had done all the work.

Mr. MINETA. But if the Federal funds—let's say for the Federal aid to urban or Federal to secondary road systems or even interstate highway moneys or other moneys go to the state and they filter down. Where do you fit into that?

Mr. KEMPTON. Currently, we fit in just like any other agency. We go through the county to solicit those funds for projects on our system. So we have to go through the priority setting of any other kind of a project. So there is no special consideration as a result of being a self help county or having those dollars ready to go. That is kind of the issue we are raising with the suggestion that this committee look at the creation of a local incentive program whereby funds might be directed to encourage local contributions to Federal transportation systems. If that money were set aside and available, then I think you would go a long way towards bringing in additional local dollars, whether they be financed through developer contri-

butions or through sales tax measures or any other sort of a program. You would be, in essence, leveraging those federal dollars getting more bang for the buck from their application.

Mr. MINETA. With these other 14 counties that have a traffic authority as a result of their own passage of a Measure A type of issue, do they have the deputy director of those traffic authorities someone from the State Department of Transportation as a deputy director as you have here in Santa Clara County?

Mr. KEMPTON. We have a satellite office here in Santa Clara County that is headed by a State Department of Transportation deputy director reporting to the district director in San Francisco. We work very closely together but organizationally, there is no formal tie to the traffic authority.

Mr. MINETA. Mr. Yohata is not a deputy of the——

Mr. KEMPTON. Traffic authority. He is a deputy director of Caltrans. We are very fortunate to have him. We have developed a very close working relationship. I think that concept speaks very well. In fact, we just advised the Department of Transportation. They have a task force looking at organizational issues.

Mr. MINETA. I got the impression that somehow Mr. Yohata was actually in your office.

Mr. KEMPTON. He is actually in Santa Clara County right next door to our operation and that works very, very effectively. So we would encourage that to be the model employed in other counties, as well.

Mr. MINETA. Do you know whether that is in fact the model?

Mr. KEMPTON. It is not the case in all of the other 14 self help counties. It should be.

Mr. MINETA. Okay. Mr. Evanhoe and Mr. Kempton, thank you very, very much for your testimony. I know that your experience of working with these programs is going to be invaluable to us, so we may be calling on you for other help.

Thank you very, very much.

Mr. KEMPTON. Thank you.

Mr. MINETA. At this time, I would like to submit for the record the statement of Robert B. Stockwell, President of Golden Gate Bridge Highway and Transportation District.

[The statement of Mr. Stockwell appears on p. 2726.]

Mr. MINETA. I would now like to call a panel made up of the Honorable Helen Thomson, Supervisor in Yolo County; and the Honorable Jim Spering, the Mayor of Suisun City.

The statement of Supervisor Thomson and Mayor Spering will be submitted for the record.

So Supervisor Thomson, if you would go ahead and proceed in your own fashion, please?

TESTIMONY OF HELEN THOMSON, SUPERVISOR IN YOLO COUNTY, CA

Ms. THOMSON. Thank you, Mr. Chairman and members of the committee. I also have with me our SACOG Executive Director, Michael Hoffacker. I would like him to stay at the table with us and provide any technical assistance to questions that you may have about our statements to you or about the study itself.

I am Helen Thomson. I am a member of the Board of Supervisors in Yolo County. In fact, this year, I am chairing the Board. I am Chair of the Policy Advisory Committee for the Joint-MTC SACOG Strategic Planning Study, one of five such studies which took place in the United States. You have probably seen the results of those studies in some of the work that you have been reviewing.

The joint study involved representatives of two regional planning organizations and locally elected officials from seven counties along the Interstate 80 corridor. Representatives, also from three districts of the California Department of Transportation were on the Policy Advisory Committee.

This corridor is the major growth area of northern California. While major concerns for congestion were expressed by representatives of the western and central portions of the corridor, the representatives of the eastern portion of the corridor expressed concerns for air quality improvement as well. In the Sacramento metropolitan area, air quality concerns are driving transportation decisions. At the end of our study, we found that air quality emerged as a primary objective of the study area as a whole, including all of the segments and all of the participants.

Our study made it clear that many improvements will be needed over the next 25 years if potential congestion and environment problems are to be mitigated. The study discussed over $7 billion in improvements throughout the corridor—well beyond presently projected transportation resources, even considering California's recent successful initiatives which doubled the fuel tax and authorizing $3 billion in mass transit bonding, including rail improvements. It is clear that the additional funds must be raised at all levels—local, state and federal. I might say that all of the local governments along this corridor have, in fact, been doing their part, most of them by passing local initiatives raising sales taxes to try to deal with the problem so that the quality of life that the citizens along the I-80 corridor have come to enjoy can be sustained.

These needs will not be met with additional funds alone, however. The funds must be applied to allow the most cost-effective proposals to meet the objectives. This means that we must be able to apply those funds to projects based upon achieving desired results—not upon arbitrary categorical programs or to achieve the best federal/local matching ratios. In order to accomplish this, federal funds should have consistent matching ratio requirements and should be able to be used upon highway capacity, parallel arterial, or mass transit projects based upon results achievable. The key word describing this approach is flexibility. I believe you have heard a lot of that word here today.

The results should be focused upon the problems being addressed. For example, urban and suburban congestion and air quality. Measurement of results would then become necessary and for this reason, a legitimate focus of federal concern. Developing the means to reduce vehicle emissions, to evaluate the air quality impacts of transportation projects, and to identify the most effective approaches to the variety of transportation problems we face should be the focus of federally funded research and development activities.

Finally, if we at the local level are to be partners with the state and the federal government in financing transportation facilities and services, we will have to make programming decisions with confidence. The funding levels and the rules regulating the application of funds must be predictable. Transportation projects are characterized by long decision processes. A major transportation improvement will span several budget cycles; often, many funding partners' budgets, and sometimes the partners themselves. Predictable federal programs will assist in long term commitment at the state and the local level.

In closing, we recognize the maintenance of our considerable investment in transportation systems and facilities as a basic priority. This existing system is the basis upon which we build improvements which together with what we now have will address the needs of the next two or three decades.

This is our advice to you for a new Federal program: adequate funding flexibly applied and focused upon results. That is what the 21st century will demand.

Thank you.

I will ask Jim to continue.

[The prepared statement of Ms. Thomson appears on p. 2664.]

Mr. MINETA. Mr. Mayor.

TESTIMONY OF HON. JIM SPERING, MAYOR OF SUISUN CITY, CA, VICE-CHAIR OF SALOG/MTC STRATEGIC TRANSPORTATION PLANNING STUDY

Mr. SPERING. Good afternoon, Mr. Chairman and members of the committee. I represent a rural county, Sonoma County. I am a member of the Metropolitan Transportation Commission. I served as a Vice-Chair of the Policy Advisory Committee.

I believe our Chairman Helen Thomson has summarized the thrust of the study very well. But I would like to add a few thoughts.

The study opened the door for some new thinking by all of us involved, suggesting that the time is right for breaking new ground in the reauthorization bill as well. Further, the reauthorization should provide program incentives to stimulate further thinking about new opportunities for solving our transportation problems. I feel very strongly that flexible funding is a very key ingredient for rural counties like Sonoma.

Through the study, we opened an inter-regional dialogue that was very healthy. This suggests to me that state and local governments can build on the past planning partnerships to create even more productive future ventures.

Finally, our study finds the need for a strong and continuing federal commitment, but we clearly recognize that we carry our own local loan as well. The threat of ever increasing congestion on a few federally adopted routes is all too clear. Every partner must bear his share in devising a broader based solution.

That concludes my remarks, Mr. Chairman.

[The prepared statement of Mr. Spering appears on p. 2658.]

Mr. MINETA. Thank you very much.

Chairman Anderson?

Mr. ANDERSON. Thank you, Mr. Chairman.

I guess either one of you. As shown in the Strategic Transportation Study, transportation concerns vary considerably among different transportation corridors.

What criteria was used to establish air quality as the primary objective for the I-80 corridor?

Ms. THOMSON. Considerable concern with the fact that we were not in compliance with the federal standard was one of the main criteria. The other is the environmental concerns, particularly on the eastern segment of the corridor in a rapidly growing area, that there needs to be more environmentally sound planning done—both for land use and transportation. And including all of that in how we go into the future.

A need, as we see it, that—and a well documented need, a very fine study, of the capacity and load, et cetera, of the interstate highway, that there are not going to be many areas that the highway is going to be terribly expandable. So we need to look at the ability to use rail; to use light rail; to increase the traffic congestion mitigation and all of the planning that needs to go into that. In California, under the California Clean Air Act, which went into effect a year ago, we need to meet even more ambitious air standards.

Mr. ANDERSON. Are you doing pretty good?

Ms. THOMSON. We are trying very hard.

Mr. ANDERSON. Thank you, Mr. Chairman.

Mr. MINETA. First of all, let me congratulate all of you in Sonoma County and Yolo County. Just last Friday, I had the chance, as Mayor Spering knows, to speak at Set Corp. I was very, very impressed with the turn-out there at that meeting and the interest that was shown. There is probably a great deal of that kind of input that went into this SACOG report that has been submitted here. I haven't had a chance to really go through it.

Specifically, how long has this been in the creation?

Ms. THOMSON. It took the Policy Committee and the Technical Committee about a year to do. As you know, our Congressman, Congressman Vic Fazio, was helpful in getting us included in the National Strategic Study as one of the five done across the country. The study went into the Federal Government about eight or nine months ago—possibly a year. I am not sure. About a year ago.

The Technical Committee was assisted by MTC and SACOG. They had a consultant. There were about four file boxes of the data that was collected. There was an enormous amount of research that went into this study.

Mr. MINETA. In terms of projections, this goes out to what years?

Ms. THOMSON. Twenty to twenty-five.

Mr. MINETA. Mayor Spering, in your statement, you said that the reauthorization should provide program incentives to stimulate further thinking about new opportunities for solving our transportation problems. Program incentives usually mean a bigger federal share—more money from the federal sources or whatever sources. Yet, on the other hand, Supervisor Thomson says that we should have consistent matching ratio requirements that sometimes push for 75/25 to 80/20 to 90/10—that push for program incentives goes against the grain of the consistent matching ratio. Right now, with

let's say interstate being 90/10; other programs being 75/25, a lot of people say, "Well, they are chasing Federal dollars. Let's do this because we will get 90/10 money whereas if we do this, we only get 80/20."

So how do we sort of square the two?

Mr. SPERING. I think that is where the system emphasis comes in on a regional basis. If you look at the I-80 corridor study, land use and air quality were very key ingredients in that study. The flexible funding. We have to have the ability to do proper planning. There needs to be monies to purchase rights of way in a rural county like Sonoma. We need to be able to do preventative congestion planning. I feel very strongly that the local agencies need to carry their load. But there needs to be a federal commitment to help subsidize that on the local level. I think there needs to be—we always talk about self help counties, but there are self help communities. Those communities need to be singled out. I represent a very small city that we put a bond issue on the ballot and it passed. For a small community, we came up with matching funds. I think those are the types of incentives that need to be written in.

Mr. MINETA. Now, this has not happened in the case of Suisun City or in the case of Yolo County or Sonoma County. But frankly, about three weeks ago, Chairman Anderson and I were up until about 11:00 one night, going through a number of requests made by our colleagues in the House of Representatives asking for demonstration projects. Any of them from $200,000 feasibility studies for something to happen in a local community somewhere to a $40 million highway project somewhere. I looked at those things and I am wondering why are we funding a feasibility study for Resume Speed, Iowa when their member of Congress is coming to us and saying, "Hey, I really need this for the City of Resume Speed for this feasibility study."

I wonder why do we really have to fund that out of federal funds? If it is that important, maybe the City of Resume Speed or the County of Waterloo or the state of Iowa ought to be funding that.

Can you give us any help as to how we should do this? Should we just say no to these if the locality is not willing to come up with it themselves?

I mean you folks have done that on a self help basis. On the other hand, I think there are 58,000 towns and communities in this great United States of America and if we were to sit there and say yes to Resume Speed, it is possible we could have 57,999 others that Ken and Paul and the Chairman and I could sit there until 11:00 at night pouring over those requests saying, "Yes, we do," or, "No, we don't fund these things."

Mr. SPERING. Mr. Mineta, I think you are touching on one of the real problems that we face in this region. I think in the Bay Area region, we have been very responsible at raising local funds. Our citizens are willing to make that commitment. I feel that that commitment should be made nationally; that if people are asking for these funds; for us to get the biggest bang for the dollar, I think it is important that there are matching funds and that the local people make that commitment. But too many of the communities can't make it on their own. There needs to be that Federal commit-

ment. It has to be moneys that we can count on; we can plan on. I think that if people know that we can deliver those projects, they are willing to put their money on the table also. I think that it is only right that matching funds should be part of this reauthorization and some element of it. It is very important. It is an incentive, so we maximize the shortage of funds.

Helen.

Ms. THOMSON. I would not like to be up until 11:00 with your projects and the applications that you have.

Mr. MINETA. Well, for the Chairman, that was an early night.

Ms. THOMSON. That was early. I am sure there are many that are deserving, particularly in the eyes of your colleagues who proposed them to you. I would suggest that there might be a way to set a criteria by which there are some more deserving than others. Maybe the matching idea is one. Perhaps the greater public good is another. Of course, that is always seen in the light of who is making the proposal. But I would see that there needs to be more of a dedication to resolving the overall need for transportation that are system related, that are project worthy; and that perhaps, there would be more of a local match. Maybe the higher the match for one that is less deserving. I just don't know that, but that is something that you are going to have to wrestle with.

Mr. MINETA. Chairman Anderson.

Mr. ANDERSON. I was going to say off the record, sometimes, you might associate some situation with a guy named Mineta. You mentioned the time that night when you came to my office. I had been working there all day. You came there late that night. We worked close to midnight. Then we have to clean things up. I suppose I didn't get home until 2:00 in the morning. Last night, I think I got in a little after 1:00, but I had to get up at 5:00 this morning to catch a plane to get here today for Mineta's committee hearing. That gave me less than four hours sleep. So if you notice that I have been kind of a little groggy here at times, you know why it is. Maybe it is Mineta more than anybody. He doesn't understand that some of us have to try to sleep a little longer than others.

Mr. MINETA. Is now the time to ask for a raise, Mr. Chairman?

Mr. ANDERSON. No. I don't want a raise; no.

Mr. MINETA. Mayor Spering.

Mr. SPERING. Mr. Chairman, I would like in the context of the system's emphasis—and that is where the urban and suburban area is. It is a network. If you have somebody that has a project that they would like the Federal Government to fund or help with through that region, it has to be part of the total system if they don't have the funds or they can't raise it locally. But I think that when you start talking about projects that just benefit a very parochial approach, I think that is when we have to question how we utilize those monies. But I think that—and that is why I wanted to just say that the system's emphasis is very critical to the suburban and urban areas.

Mr. MINETA. I think that our problem is that the local mayor, the local chair, the board of supervisors goes to their Member of Congress. That Member of Congress comes to us, says, "We need this."

"Well, is it in the state five-year STIP, State Transportation Improvement Program?"

"No."

"Is it something that Resume Speed is willing to fund?"

"Well, no. They are really hard-pressed. All we have got are catfish farms in our area. They don't have much money to fund."

Am I starting to give away some specifics on projects? I think that was the cat in Yazoo City, Mississippi. In any event, there are some cases.

Or you say yes to Congresswoman Thomas, but no to Congressman Spering.

Mr. SPERING. Yes, it is. We understand.

Mr. MINETA. Well, let me thank both of you for your part in both the MTC and as part of your work on SACOG in putting this together. Without a doubt, Congressman Vic Fazio is a very key member of the Appropriations Committee.

As I mentioned at the Sonoma County Economic Development Corporation last Friday, he is looked to not only in general on leadership things, but when it comes to transportation, we really do look to him.

So again, I thank you for your being here and for your being so fortunate as to have a very effective member of the Congress.

Mr. SPERING. Thank you.

Mr. MINETA. Thank you very, very much.

At this time, I would like to call on a panel made up of Mr. Terry O. Cooper, Director of Transportation for the City of Fresno; and Mr. Richard Welton, Director of the County Department of Public Works.

San Jose and Fresno have a lot in common given the fact that the city manager here now is Les White who was formerly in Fresno and our Director of Aviation now in the City of Jose as a former Fresnan. It is great to have the contributions that you have already made to the City of Jose and we look forward to the contribution being made by this panel.

So Mr. Cooper, I will have you go ahead.

TESTIMONY OF TERRY O. COOPER, DIRECTOR OF TRANSPORTATION FOR THE CITY OF FRESNO; RICHARD WELTON, DIRECTOR OF PUBLIC WORKS; AND JEFFREY WEBSTER, GENERAL MANAGER OF FRESNO COUNTY RURAL TRANSPORTATION AUTHORITY

Mr. COOPER. Thank you, Mr. Chairman. Indeed, we do feel at home when we come to San Jose and sometimes wonder if it will be our own home pretty soon.

With me this afternoon, Mr. Chairman, is Mr. Richard Welton who is our Director of Public Works and Mr. Jeffrey Webster who is the General Manager of the Fresno County Rural Transportation Authority.

As you know, in the testimony that we are submitting as part of the record, that I am the Director of Transportation for the City of Fresno and the Fresno Area Express and also recently took over for Ralph Tonsetta at the Airports Director of Transit and Aviation.

I appreciate the opportunity to testify before the subcommittee today on the federal reauthorization program. I would also like to speak on behalf of the principles of the American Public Transit Association which we are seeking to have included in the upcoming reauthorization of the Surface Transportation Program. I am also currently APTA's Vice President of Government Affairs.

The principles adopted by APTA's membership are particularly relevant to the difficulties in the City of Fresno, the San Joaquin Valley and throughout the state of California. Small and medium sized communities and systems through the nation are facing an ever growing demand for additional transportation services far beyond their capacity to handle them. We are all keenly aware of the needs of the large metropolitan areas which you have heard so well today; they sometimes seem to us insurmountable in the challenges that they face. But there is a common element which exists at all levels and that is the need for continued and increased Federal transportation programs.

The reauthorization process coincides with the crisis in the American transportation systems nationwide. The demand for additional capacity is growing relentlessly at the same time the requirements to deal with the negative impacts of traffic congestion, lost productivity, air pollution and other environmental problems are growing at an equally incredible rate.

In Fresno, Fresno County and the entire San Joaquin Valley, we have one of the worst air pollution problems in the state, if not the nation as carbon monoxide emissions from on-road vehicles currently constitute 65.1 percent of our local and regional smog problems. How government and private interest at every level respond to these problems will make the difference between success and failure in fostering our continued economic growth, cleaning up our air and ensuring the high quality of life for all of our citizens over the next decade and into the 21st Century.

In 1986, the City of Fresno and Fresno County along with Alameda County, modeling a local Santa Clara County proposition; enacted a local, transportation specific sales tax to address our growing transportation needs. We are one of some 14 California counties which have enacted specific transportation sales taxes recently.

As has been referenced here often, you are also well aware of the state of California's recent propositions 108, 111 and 116 which show that Californians understand the importance of transportation and the priority of paying for transportation versus not paying.

We urge the Federal Government to recognize the particular importance which has been demonstrated here that people are willing to pay specific taxes for specific reasons and benefits thereof. To further recognize the Federal Government's role which has invested billions of tax dollars into major transportation systems over the last 30 years cannot logically be reduced and in fact must be increased to meet our demands and requirements for additional services in the future.

Growth estimates for the Fresno Clovis Metropolitan Area over the next 25 years or by the year 2015 are projected to increase by more than 64 percent from its current level of some 435,000 to more than 714,000 people. The ability to deal with the anticipated

growth is further complicated by the mandated requirements for accessibility and alternative fuel operations which will soon be enacted. We support both of these ideas and concepts and will work diligently to try to make them effective. But specifically assuming an annual operating budget for our local bus system of some $15.3 million, the needs for compliance and requirements over the next five years can be outlined as follows:

Just to replace our current 90 vehicle system, which are currently 13 to 15 years old, will cost at today's rate some $10.7 million.

Service demands, which are not being met right now, for additional evening service, greater frequencies, more expressed type could constitute some $19.3 million additional cost.

The compliance requirements, as I mentioned, will increase our annual budget, just for fuels more than double by $1 million a year or some $4 million or $5 million over the next five years.

Full compliance with the ADA bill will also add to our costs; specifically, we are not sure as to how much at the current time. But significantly, it will add to those costs also.

To meet the demands at a time when existing transit facilities are in desperate need of upgrading which has been caused primarily by reductions of federal assistance over the last ten years of more than 50 percent, is simply impossible to do.

On behalf of the City of Fresno, small and large transit systems throughout the country and the American Public Transit Association as a whole, we urge the committee to support a national goal of increased transit availability and ridership which will be necessary to fund to through increased federal assistance as described very specifically as follows:

The Federal Government's investment in public transit should be increased to at least $11 billion annually; $6.5 for essential reinvestment to maintain the current level of services; and an additional $4.5 billion for capacity expansion to meet the demands of the future.

To provide reliable, predictable funding, it will be necessary to enact a 7 cents per gallon increase in the federal fuel tax earmarked for transit.

The Federal Government should provide transit systems with additional aid to pay for compliance with federally mandated clean air and accessibility requirements.

Metropolitan areas should have greater flexibility, as you have already heard, in the use of Federal transportation funds to meet more specific local transportation needs.

The definition of transit should be broadened to include a wide range of high occupancy vehicles and shared ride services. It has to be multi-modal.

The federal government should eliminate tax policies that discourage transit use and private investment in transit facilities.

In conclusion, by incorporating these principles into the Surface Transportation Reauthorization legislation, your committee can reassert the proper Federal responsibilities by ensuring that transportation policies achieve national goals while maintaining an appropriate area, state and local control over planning and implementation. Many local and state governments throughout the country have already absorbed a large portion of the Federal reduction

in transportation investments but may be stretched to the limit on their ability to meet the future needs.

Again, Mr. Chairman, I would like to thank you for the opportunity to testify before the committee today. I would like to now pass it on to Mr. Welton to express some of the multi-modal aspects on the highway side.

[The written statement of Mr. Cooper appears on p. 2564.]

Mr. MINETA. Mr. Welton, your statement will be made a part of the record. So if you would go ahead and proceed in your own fashion.

Mr. WELTON. Thank you very much, Mr. Chairman. I appreciate the opportunity to be heard before your committee. I am also speaking on behalf of the County Association of Engineers in the State of California. We have discussed our paper with some members of your committee at a previous meeting in Washington. We appreciate that and appreciate your putting that into the record.

I would just like to stress that the fiscal requirements to simply maintain and rehabilitate California's city and county road facilities is staggering. Counties are responsible for over 70,000 miles of roads in California. A recent California Senate Transportation Committee study documented that funding deficiencies for just maintaining, rehabilitating and reconstructing county roads alone stood at $6.9 billion.

The recent transportation measure adopted by California will allocate from about $1.5 billion to the counties over a ten-year period. That leaves about a $5.4 billion shortfall. This means that that amount will contribute to health and safety problems for our tax payers, as well as contribute to a decline of the economy. The voters in several California counties have imposed local sales tax measures and other counties will be considering measures in the near future. Even with the revenues generated by these measures, they will still fall short of meeting the needs without the continued financial commitment of our Federal partner. In fact, these measures, as in the case of our county—in Fresno County—rely on the continued support to carry a complete transportation system. Our transportation measure was developed around the reliance on both state and Federal funds continuing at their current level.

Our Association has reviewed various documents and policy statements made by other Associations and other organizations and we find it very comfortable when you look at the policies and the concepts that are embodied in that because we all seem to be saying much the same thing.

I would like to just summarize some of those concepts that we have discussed. I would like to caution, however, that we know that as you formulate the actual Surface Transportation Act, the reauthorization of that Act; that when that language then begins to formulate, we have concerns how then the numbers come out when we are supporting these concepts.

So first of all, you have heard from almost everyone to support adequate levels of funding. That includes the spending down of the Trust Fund which we would like to commend your committee and your efforts in that area; particularly Chairman Anderson and his discussions about keeping that off budget. We think that is a significant help to locals.

As Terry Cooper mentioned, one of our important ingredients in our measure was assuring the constituents that that money was going to be spent for that purpose.

Under maintenance and rehabilitation, we all seem to be consistent. Protect the existing investment by assigning a high funding priority to the maintenance and rehabilitation of the existing national transportation system. That includes in the counties' views—by the way, I should mention that all 58 counties in California have participated in this study and are a part of this organization. But we all see, such as the FAS system, that you have designated and has been in existence for close to some 40 years now, is the back bone of much of the rural system in our counties. We feel that continued support of that is going to be key to our being able to keep that system up.

The next major point is to expedite project delivery. Many of the engineers in California have some fairly specific ideas on that. You have heard some folks talk about that today. But we think by establishing performance standards to reduce overly restrictive design standards is one; certify local agencies to direct pass-through of the funds; and certify the state environmental review process in lieu of the Environmental Protection Act process. We think those are some very specific things that could be addressed.

The next major point would be to support a local block grant funding concept, similar to what we are talking about in Project Delivery. To maintain existing Federal participation, allocate funds based on categorical programs—as I mentioned, FAS could be FAU, the bridge program, highway safety. Allow these decisions to be made by local decisions.

The next major point would be urban congestion and rural access. Many of the other folks have talked about that today. Emphasis should be given to those solutions to solve the urban/suburban congestion and also then for access to the national system highways in the rural areas in a cost effective manner.

Finally, support the user fees. Ensure that transportation uses bear the maximum practical and appropriate share of the costs of services and facilities that they use. As an example, your fuel tax and truck weight fees.

In conclusion, I would like to thank the committee on behalf of the County Engineers Association of California. We are looking forward to working with and for your providing us the opportunity to speak from a local perspective for the ones who end up designing and building the facilities that support the national transportation system.

Thank you.

[The prepared statement with attachments of Mr. Welton appears on p. 2712.]

Mr. MINETA. Thank you very much, Mr. Welton.

Chairman Anderson.

Mr. ANDERSON. Thank you, Mr. Chairman.

Mr. Cooper, if the definition of transit is broadened to incorporate HOV lanes, how would the city and County of Fresno apply this concept to your transit planning and operations?

Mr. COOPER. Well, the way we look at it from a local perspective, Mr. Chairman, has been one that has shown—without hesitation,

we like to consider ourselves the model of inter-modal cooperation. When we developed our local transportation sales tax agreement, Richard and I worked diligently with our local MPO and identified the fact that there are other ways to meet the needs of transportation in communities such as ours. We know that we have to work together to provide the facilities that will simply get more than one person in the car. There is a share of everything to be worked out together. We understand the importance a good road systems play toward achieving that and providing our planning efforts and focus on HOV lanes as a method to expedite that movement, as well as high occupancy vehicles such as buses. We need to have the facilities for us to achieve our own organizational goals also.

Mr. ANDERSON. Mr. Welton, are the City and County of Fresno considering the construction of a light rail system; and if so, will you anticipate providing state or local funds to over-match this transit capital project as Secretary of Transportation Skinner has proposed?

Mr. WELTON. There have been studies made. At the current time, there is not a proposal for a city/county type of a project for that, but it is under consideration again. I think that Mr. Cooper could probably talk from the city's perspective because they have been most interested in that.

Mr. COOPER. Mr. Chairman, I would say that we would like very much to be on a project listing for future light rail. As we look at the growth of Fresno, as I mentioned, some 64 percent over the next 25 years, we feel that the demand will be there for such an installation.

Will we be able to over-match it?

Since we have a 20-year tax, also, the probability would not be there under the current system. If we were to renew or reauthorize our local half cent sales tax, the priorities of how those dollars are spent on the modes may changes also. It is currently 75 percent highway oriented. Those modes may change and say that if it is extended for another 20 years, yes, we may indeed focus upon mass transportation alternatives. Even the congestion management plan may dictate such a requirement. But certainly, if the opportunity was there, the over-match effort would be made.

Mr. MINETA. Thank you, Mr. Chairman.

Thank you. Mr. Webster, I'm sorry. I should have asked you if you had a statement to make or comments. Please feel free to do so.

Mr. WEBSTER. My name is Jeffrey Webster. I am General Manager of the Fresno County Rural Transportation Agency.

I wish to speak you today on behalf of the small, urban rural non-profit contractor and transit operators not only here in California, but throughout the Nation; both as Chairman of the California Association for Coordinated Transportation and State Delegate to the Community Transit Association of America.

We are concerned about adequate funding for such programs as Section 18, Section 16(b)(2), RTAP and the like. Also including Section 9(a)(1) funds for some small, urbanized areas. We recognized that there is a funding crisis to replace our capital equipment. Currently, the funding nationwide indicates that we can replace about a third of our fleet annually.

We are concerned about operating impacts on our budgets; things such as the drug rule; the fact that those particular regulations entail no additional funding to assist us as small rural operators in meeting those particular requirements.

We are concerned about the impacts in meeting the Clean Air Act and being located in the San Joaquin Valley, as Mr. Cooper has indicated, we will be responsible for responding to some very critical methods in resolving how we operate in our County to assist the Air Quality goals and objectives.

We are concerned about our costs in relationship to the Americans with Disabilities Act and how those impacts will relate to our available funding. During the past 5 years, we have noted a 25-percent decline in the available funds for the Section 18 program and approximately a 30-percent decline in the Section 9(a)(1) funds. We have noticed a small decline in 16(b)(2) funding. We are hoping that as the committee proposes legislation, there will be adequate consideration for increased funding. So when we are talking about sharing block grant programs, there will be adequate funds for all of us to compete against.

Thank you.

Mr. MINETA. Thank you very much, Mr. Webster. Remind me, how are you structured? Are you a private non-profit?

Mr. WEBSTER. We are a joint powers entity made up of County and 13 incorporated cities. We provide service outside the Fresno metropolitan area, 29 vehicles, 17 subsystem locations, one to three vehicles per urban/rural community with service to and from Fresno, primarily as back-up to common carrier service in our county.

Mr. MINETA. Does that include para-transit?

Mr. WEBSTER. Yes, it does. We also coordinate with our local Economic Opportunities Commission to provide what is called a consolidated transportation services agency operations in our County. That was enacted by the California legislature back in 1979 to ensure that there was adequate coordination with all social service transportation to ensure elimination of duplication.

Mr. MINETA. Mr. Cooper, your local tax over-ride is for what period of years?

Mr. COOPER. Twenty years.

Mr. MINETA. It's a 20-year program?

Mr. COOPER. Yes, sir.

Mr. MINETA. Most of the programs that I have heard of are usually ten years; are they not?

Mr. COOPER. Yes. Actually, when I reference in my testimony that we modeled the Santa Clara proposition, that was one of the models that we learned from. We felt that because we had such a multitude of project's in the rural area and in the out-county as far as road repairs, as well as the urban area for major new highway construction, we just did not feel that ten years would be sufficient to do that; went for a 20-year proposition which will generate some $900 million over that 20-year period.

Mr. MINETA. In your statement, you are suggesting that there ought to be a 7 cent per gallon increase in the Federal fuel tax?

Mr. COOPER. Correct.

Mr. MINETA. Obviously, I didn't realize yours was a 20-year tax, so it is going to be a little different. I was going to suggest if you are going to be sunsetting in ten years and you are going to be coming up for a tax in a couple years—let's say, Santa Clara is facing that where they are going to have to go for a tax increase in the next couple of years. Without asking for an additional 7 cents, we just passed an increase here with Prop 111 as to whether or not we could even stand the gaff of going for a 7 cent increase at the Federal level, given the fact that there is $11 billion sitting idle in the Highway Trust Fund.

So I will pass on that question for you right now.

Mr. Welton, in one of the suggestions here, you talk about the emphasis should be given to solutions to solve urban/suburban congestion and for access to the national system of highways in the rural areas in a cost effective manner.

I would like to ask what do you mean by "access to the national system of highways in the rural areas in a cost effective manner"?

Mr. WEBSTER. We currently—the system that we now have in place, just about anybody in the United States can drive from their home to Washington, DC. So we look at it as a total system. Our FAS system is probably one of the most vital ones that we see in the rural areas of our California counties.

We have made some suggestions about productivity; setting standards of performance, rather than being more specific about the environmental review process. That is what we mean by a cost effective manner. We think that with some attention in the new Act, that you could make it work better for us. That the time requirements could be reduced in the processing of projects and so forth.

Mr. MINETA. Let me dispel any high hopes that you might have about cost effective meaning any attempt to combine state environmental review processes with the Federal. I don't anticipate that we will be doing anything between merging, let's say SEQA and NEPA. Those are going to have to be two separate tracks of their own. I, for one—unless I hear from the Chairman or somebody else—will not be working towards doing anything along trying to sandwich state environmental quality process or the elimination of NEPA or whichever way it is to go. That is too much of a political and substantive issue to take on, frankly. I am not up to it, unless the Chairman says we ought to do it. I don't see us taking on NEPA and SEQA at the same time.

Mr. WEBSTER. Let me suggest what we were hopeful is is that they would consider that as at least equal to or greater. You have heard some testimony here today——

Mr. MINETA. Well, we have had testimony on that. But in your view, you say to certify state and environmental review processes in lieu of the Environment Protection Act process. That "in lieu of" just means scratching it.

Mr. WEBSTER. That would mean if our requirements were greater than NEPA. It is much the same as the Air Quality Standards. We are going to find ourselves going through two paperwork processes to certify projects. They will both essentially do the same thing, but it will require a stack of paper to complete a project which we feel is duplicative.

Mr. MINETA. That is one, I guess, we will have to really wrestle with. Concurrence, I can understand. In lieu of would be very, very difficult.

Mr. WEBSTER. I appreciate that.

Mr. MINETA. I think that is as many questions as I have.

Let me ask the staff.

Well, again, thank you very, very much for helping us because again, it is important that we hear from the operators.

At this time, I would like to call on the Honorable Bill Pine, Commissioner, Grays Harbor County Commission, from the Washington State Coastal Highway Coalition; and the Honorable Don Forbes, State Highway Engineer of the Oregon Department of Transportation.

Mr. Pine and Mr. Forbes, we have your statements. They will be made part of the record.

Mr. Pine, if you would go ahead, sir?

TESTIMONY OF BILL PINE, COMMISSIONER, GRAYS HARBOR COUNTY COMMISSION, AND THE WASHINGTON STATE COASTAL HIGHWAY COALITION

Mr. PINE. Thank you, Mr. Chairman and members of the committee for this opportunity to testify today. My name is Bill Pine. I am a County Commissioner from Grays Harbor County in Washington and I represent the Costal Highway Coalition in Washington state. That is a five-county area. If you are familiar with a map of the Olympic Peninsula, you come across Morgan and come into Pacific County, head up the coast and there are five counties on the coast of where Highway 101 goes through.

The key point of my testimony are as follows:

We believe that any planning and improvements to the 101 corridor should be done in terms of the Pacific Coast, not just Washington State.

Our region is one of the key timber areas in the northwest, which you have probably heard about recently, and we recognize the need to diversify. The changes to the economy in coast Washington must be prepared to meet and better facilitate the increasing tourist and industrial of Highway 101 corridor.

Highway 101 in our area is most often a twisting, two-lane road with few opportunities to pass, limited pull-outs and no rest stops.

Our coastal area include the Olympic National Park which is the fifth most visited park in the U.S., the Strait of Juan De Fuca, the Hood Canal, along with protected bays and marshes, sand beaches and rocky coastlines.

In my county alone, we have 100 square miles of protected estuaries and seven state parks.

Washington is committed to an improved Highway 101 transportation corridor. A concept plan for Washington's 101 corridor is currently being developed.

Washington state, in their next six-years for the highway plan has budgeted $150 million for Highway 101 in our area. The plan will be a comprehensive look at the highway as a whole and develop a strategy and approach for future planning and improvements.

We agree with Oregon that the Federal Government has a role to play. In order to advance a multi-stage effort, Federal leadership is needed in defining, designating, coordinating and planning scenic highway corridors that address geographic region, rather than being fragmented by political lines.

We join Oregon in recommending that the committee review the National Scenic Byway study with this role in mind.

Thank you. I would be pleased to answer any questions the committee wishes to ask.

[The prepared statement of Mr. Pine appears on p. 2642.]

Mr. MINETA. Mr. Forbes.

TESTIMONY OF DON FORBES, STATE HIGHWAY ENGINEER OF THE OREGON DEPARTMENT OF TRANSPORTATION

Mr. FORBES. Thank you, Mr. Chairman.

For the record, I am Don Forbes, the head of the State Highway Division for Oregon.

You have my written testimony, and I wish to summarize by asking that as you contemplate the next Surface Transportation Act, you consider three requests:

First, that you identify interstate preservation as a primary goal for the next Act. Those of us who are asked to manage highways, generally have to manage broad and often competing areas of need. One is the need to protect the existing investment. That is, preserve our systems.

The second is to expand capacity to meet increased traffic demand.

Clearly, demand growth and the need for modernization, particularly in our urban areas, is an overriding concern and yet, it does not make good economic sense to underinvest in the current system to the point in which it becomes part of the problem.

So we ask that you assert interstate preservation as a primary goal of the next act.

The second request is that as you apportion funding for interstate preservation you re-establish lane miles as a primary determinant of need on the interstate system.

The current Act was amended in 1981 to increase the representation of "vehicle miles traveled" from 25 percent to 45 percent of the formula. That made good sense at the time because much of the system was relatively new. Sections of the interstate with high traffic usage were likely to deteriorate more rapidly than the rest of the system. Today, however, we are at a point nationally where most of our interstates are approaching their design life; whether because of accelerated wear or because of age. It is time to again look at lane miles as a primary determinant of need.

Finally, I request that as you review the national scenic byway study, you remember a strong Federal role is necessary in defining, designating, coordinating and planning multi-state, scenic highway corridors.

Thank you.

[The prepared statement of Mr. Forbes appears on p. 2583.]

Mr. MINETA. Thank you very much.

Chairman Anderson?

Mr. ANDERSON. Thank you, Mr. Chairman.

Mr. Pine, the Coastal Highway Coalition supports the efforts of the tri-state Highway 101 council to improve Highway 101 as a single project.

What is the estimated cost to improve the Highway 101 corridor within the states of Washington, Oregon and California?

Mr. PINE. I asked that same question to people from Washington State Transportation two days ago. They didn't have a current estimate on that.

Mr. FORBES. Mr. Anderson, if it helps, the estimate in Oregon is somewhere between $300 million and $500 million.

Mr. ANDERSON. I do have a kind of a problem on your area, particularly Mr. Pine. I am from southern California. Do you know where Sedrowool is?

Mr. PINE. Yes, I do.

Mr. MINETA. Well, I have a son who is on the City Council there. I have a hunch that may be why one of the Congressmen from Washington came to me a short time back and told me that they have a problem over there where they need some highway development, particularly in the northern part of Washington. He gave me the cards and names of six Congressmen in that area who were involved and he said agreed with them. There was a suggestion that I come up there and hold hearings and take a look at it. I haven't got that far, yet; but I just want you to know that there is some interest up there in your state to get better highway activity.

Mr. PINE. Thank you. I would like to add just in our county alone, I could use the Spotted Owl, but that has received quite a bit of publicity. As we see our area declining as far as logging, we have to help the people help themselves. Highway 101 really is a two-lane road with very few places to pass. It needs improvement. Again, I know the state is planning to spend $150 million, but we do need the help of the Federal Government to help with the planning—to provide better opportunities for tourism and also for commercial improvements in the area.

Mr. ANDERSON. Thank you, Mr. Chairman.

Mr. MINETA. There is an effort to create a National Scenic Highways Program. I take it that many are interested in it, including Highway 101 as part of that National Scenic Highway System. We are also considering the establishment of a new category in view of the fact that the interstate system that was started in 1955 on the 1955 legislation. We will have completed by the end of 1991, the 41,000 miles of the interstate highway system.

So under this new reauthorization, the post-interstate program, we will probably have something called this Highways of National Significance.

I am not sure that we have really come to any kind of a definition as to what that should be, but at least in the past, we have been trying to reduce the number of categories of highways, forest roads or farm to market roads, things of that nature. I am just wondering, given the fact that we are trying to reduce the number and we are in the process of now substituting the Highways of Na-

tional Significance for the Interstate Highway System, whether or not the creation of a National Scenic Highway system is running counter to our effort to want to reduce categories.

Mr. FORBES. It could well do that. It depends on how you form the Act. But certainly, the fewer categories, the more predictability and the easier it is for us to plan. I would always encourage the fewer number of categories in which we could operate.

Coincidentally—it may be of some interest for you to know—that Oregon has created an intrastate system that we call "Access Oregon Highways" which is analogous to the nation's interstate system. That is, we are funding non-interstate highways within Oregon that contribute most to tourism and commerce by either linking a port and border or urban area. That is our own state's system of significance.

Mr. MINETA. Mr. Forbes, in your statement, you were talking about declining pavement quality and the whole issue of design life. What do you attribute some of the problems that I seem to be hearing from other areas about the roads not holding up to design life? Is that a problem of design specification; construction materials; construction itself; or maintenance after completion of the project? What do you think?

Mr. FORBES. Mr. Chairman, it could be any of those. I think the primary factor within our state is simply that we underestimated the volume of traffic that our roads would carry, particularly heavy truck traffic. Particularly with heavier loads and higher truck pressures, pavements are stressed beyond what our designers would normally anticipate.

In some of the other states that use salt heavily in winters, you have that environmental factor which greatly increases degradation.

Mr. MINETA. Let me thank you. You have in your states very, very fine representatives. Congresswoman Unsoeld in your area, Mr. Pine, is just a very effective spokesperson. But both in Congressman and Congressman Aucoin, they are very effective, powerful members of the Appropriations committee. We are just mere of an authorizing committee. Sometimes, we have to fight against the power of the appropriations committee. But under the leadership of Chairman Anderson, we do very well.

Mr. ANDERSON. And don't forget the name Tom Foley.

Mr. MINETA. Tom Foley. Let's see, he is the Speaker; isn't he?

Mr. ANDERSON. Yes.

Mr. MINETA. Oh, yes. The Speaker. He does have a little to say—I shouldn't say little. He has a lot to say about what happens.

You do have very effective representation there. They are constantly on us about their needs in Oregon and Washington. So you are very well represented in the Congress through the members of the Appropriations Committee.

I want to thank you very, very much for being here.

Mr. FORBES. Thank you, sir.

Mr. MINETA. Mr. Forbes, before you get away, let me ask you about lane miles. You mentioned lane miles.

That is an ongoing problem that I think vexes us. Lane miles versus vehicle miles travelled. Is there an easy way out on that?

Mr. FORBES. I am not sure that there is, Mr. Chairman. From an engineering standpoint, if you had a new highway with reasonable expectation that you use quality materials and quality construction, you know that that highway will deteriorate quicker with the high volume of traffic, particularly heavy traffic, such as trucks. However, there reaches a point when any of those materials begin to reach their design life irrespective of the amount of traffic on the road. I believe that is where you are today with much of your interstate system. That is, irrespective of the amount of traffic that is on it, it is simply at the end of its life. So it would seem that if you were to put a greater emphasis now on lane miles as opposed to vehicle miles travelled, you begin to reflect that need of the overall system.

Mr. MINETA. Are you using anything in Oregon other than salt on your roads for in the winter time?

Mr. FORBES. Mr. Chairman, we are not using salt on our roads at all in Oregon. We never have had. We use some limited de-icing—mildly corrosive de-icing materials on our major bridges in the Portland area. Otherwise, we simply sand our roads and people expect to use chains over the mountain passes.

Mr. MINETA. Very well. Thank you very much.

At this time, I would like to call forward a panel made up of Katherine H. Strehl, Manager of Community Relations, Lockheed Missile and Space Group; Arielle Leonard, Director of Transportation and Land Use, Santa Clara Manufacturing Group; Angelo Siracusa, President, Bay Area Council.

I am pleased to have this very distinguished panel before us.

Katherine, if you would go ahead and start?

TESTIMONY OF KATHERINE H. STREHL, MANAGER OF COMMUNITY RELATIONS, LOCKHEED MISSILE AND SPACE GROUP

Ms. STREHL. Mr. Chairman and members of the committee, I want to thank you for the opportunity to provide testimony to you on this very important topic.

I am Katherine Strehl, Manager of Government and Community Relations for Lockheed Missiles and Space Company.

I believe you have heard all of the numbers before about California's most recent investment in transportation. We have a $20 billion package of measures that have been approved by the voters in June. Additionally, in this county, we spend about $200 million in local revenues for transportation improvements. In spite of these investments and the infusion of new money, it still is not enough. With California's population increasing every year by some 700,000 new residents, our transportation infrastructure simply cannot keep pace with anticipated growth.

For a company like Lockheed Missiles and Space Company, this is a significant problem. We have roughly 23,000 employees in Santa Clara County. I think that qualifies us to be the largest industrial employer in northern California. Our employees commute from everywhere. We have some employees anywhere from San Benito and Monterey Counties to north Sacramento and San Joaquin. Faced with the prospect of no affordable housing, in close

proximity to our facility, more and more of our employees are travelling to the Central Valley.

We have about 260 employees that commute in everyday from Sacramento and San Joaquin Counties. They face one way commutes of up to three hours, 90 miles to 120 miles. That is one way.

It is fair to say that transportation is a critical issue for this and other companies in Santa Clara County. We are increasingly having difficulty recruiting and retaining qualified labor and to remain competitive in the national and international marketplace.

Importantly, the transportation is now linked with air quality and environmental quality. Under the mandates of the California Clean Air Act, this region—the Bay Area—will have to reduce auto emissions by about 35 percent. To achieve this, many businesses will be asked or required to implement some kind of a ridesharing program. Lockheed has had such a program in place since the early 70's and in spite of an infusion of both dollars, as well as personnel, our ridesharing rate stands at 25 percent, considerably below the 35 percent that will be required by the law.

We are hopeful in the Bay Area to be able to avoid the regulatory approach that has been adopted in the South Coast to meet our air quality standards. But to do so, we need all the help we can get. That is where the post-interstate national program can be of assistance to us.

I will just briefly run through what we see as some opportunities.

One is to continue and increase Federal funding. Without a Federal investment in California's transportation infrastructure, it is not clear that we are going to be able to achieve our congestion reduction or air quality goals.

Second, adopt Federal funding guidelines which will allow for regional planning and implementation of transportation priorities. No two states have identical transportation funding needs. Similarly, no two regions in this state or anywhere in the nation have the same profile. We would suggest that Federal funding should not dictate regional priorities.

Three, establish a national program which provides maximum funding flexibility. Regions should be encouraged to take a systems approach and to spend Federal dollars according to the area's needs regardless of mode or ownership.

Four, enact Federal policies which promote and reward intra- and inter-regional cooperations. Commuters do not recognize jurisdictional boundaries when travelling on a roadway, whether it is interstate, state highway or a local arterial. Similarly, in addition to coordination in terms of road improvements, we need to encourage cooperation between transit agencies in all aspects of their operations.

Fifth, implement national policies which will provide incentives to reduce congestion and vehicular emissions. I think it is going to take cooperation and participation of both the public and private sectors of all employers and individuals alike. There are some things, I think that can be done at the Federal level. Tax credits for employers who invest in commute alternative programs; upping the amount that employees can exclude from their income tax calculations for transit subsidies; look at and begin to address some of

the liability issues that employers face when sponsoring commute programs.

I would now like to shift gears and give an example of one program that is of particular importance to us and where we need federal funding. That is the Tasman Corridor Study. Light rail in this corridor will connect with the Guadalupe light rail and ultimately with BART in the East Bay. It will provide access to housing in the south San Jose as well as in the East Bay and Contra Costa and Alameda Counties. It is something that, without Federal funds, we won't be able to get done.

I would have to confess that Lockheed has some self-interest here. It will affect and directly serve many of our 23,000 employees.

Again, I would like to thank you for the opportunity to comment, and we look forward to continuing in your future deliberations.

[Statement of Ms. Strehl appears on p. 2660.]

Mr. MINETA. Thank you very much.

Ms. Leonard.

TESTIMONY OF ARIELLE LEONARD, DIRECTOR OF TRANSPORTATION AND LAND USE, SANTA CLARA MANUFACTURING GROUP

Ms. LEONARD. My name is Arielle Leonard. I am the Director of Transportation and Land Use for the Santa Clara County Manufacturing Group.

The Manufacturing Group is a business association. We have over 100 corporate members which address public policy issues that affect the business climate as well as the quality of life in the Santa Clara Valley.

I would like to emphasize to you that the Manufacturing Group has always considered transportation a priority issue. We have been active in a number of regional and local transportation planning processes. We have either initiated or participated in a number of local projects, including rail extensions and our half cent sales tax and the recently enacted Proposition 111.

I am here today in order to emphasize to you that a modern, efficient transportation system in the Silicon Valley is crucial to the continued vitality of our high-tech industry. The decisions that we make here today concerning Federal dollars for transportation projects will not only impact the mobility and air quality and life style of the region, but the economy as well.

The effects of traffic congestion on the economy are very real and have been felt by virtually every major corporation in this area. Employees who are now commuting unprecedent distances in order to get to work are sharing the roads with unprecedented numbers of other commuters. If a prognosis of an additional 300,000 jobs into Santa Clara County within the next ten to 15 years holds up, things will be considerably worse.

The situation obviously robs workers, not to mention their employers of productive time. It also takes its toll on the workers' mental and physical health, rendering them less capable of doing their jobs.

Traffic congestion and lack of mobility have made the critical problem of recruiting talented professionals to this area extremely difficult, if not impossible.

I don't expect that any of this is new news to the committee. I simply wish to add the urgent voice of industry to the chorus of concern expressed by our local government representatives and transportation agencies here today, that we arrive at a realistic, sensible way to channel post-interstate dollars into local and regional transportation programs.

As we look to the reauthorization of the post-interstate program, several points seem to make sense from an industry standpoint.

The first is that the role of the Federal Government in transportation should not be diminished any further than it already has. While obviously, Californians, and Santa Clarans in particular, are not adverse to reaching into their own pockets in order to improve our regional transportation we are still very much in need of Federal dollars if we are to keep up with the degree of population growth that we anticipate here in the county over the next 20 years.

When it comes to directing the expenditure of federal money, we agree with some of the key points previously made to this committee by Larry Dahms, the Executive Director of the Metropolitan Transportation Commission. Our first priority must, of course, be to maintain the enormous investment we have already made in our interstate system. But beyond that, we need to revise our vision somewhat in order to address our transportation needs effectively.

As Larry Dahms pointed out, the interstate system does the job of providing access from one metropolitan area to another, but it is getting around within the region that is our real problem. We agree with MTC that we need to take a systems approach based on the particular circumstances of a given area. Federal funding should be flexible enough to accommodate local needs for transit, highways, HOV lanes and transportation systems management programs.

Funding criteria should be related not simply to mobility but to conformance with regionally acceptable clean air and land use standards.

The unique combination of factors that have made Silicon Valley the high-tech capital of the world is frankly being threatened with traffic strangulation. Industry requires and requests federal action to ensure adequate state, regional and local transportation in the post-interstate era.

Thank you.

[Statement of Ms. Leonard appears on p. 2597.]

Mr. MINETA. Thank you very much, Ms. Leonard.

Mr. Siracusa, good to see you.

TESTIMONY OF ANGELO SIRACUSA, PRESIDENT, BAY AREA COUNCIL

Mr. SIRACUSA. Thank you, Mr. Chairman and Mr. Anderson. Thank you for allowing us to testify today on behalf of the business community.

I am sorry that I did know that I was going to be here today; therefore, I don't have a written testimony. I probably cannot add a great deal to what has been said.

I am also a member of the Bay Conservation Development Commission and BCDC representative on the MTC.

I would personally like to endorse the comments that have been made by the MTC representatives and which were just made here.

I would like to instead of focusing on those, just talk a little bit more generally about the business interest in transportation, air quality, land use, mobility issues; and hope that they will hit a responsive chord.

I think it is fair to say that in California—and I think probably throughout the nation—that there is a strong, not just a perfunctory interest, by the business community in the continued funding for transportation at the Federal, state and local level. For as long as I can recall, there has been very strong business leadership to pass a gas tax increase in California. Now, of course, it is culminating in the passage of Proposition 111.

In the Bay Area, the business community was very influential in the bridge toll increase and all of the five sales tax measures. It is, I think, unusual for the business community to boast about promoting sales tax or gas tax or other forms of tax increases, but I think what it demonstrates is the very strong commitment to transportation and the knowledge that a healthy transportation system has a direct and pervasive effect on the health of the economy and the quality of life of any region. Therefore, it should not be surprising that we would support tax increases.

Over and above that, we are now, of course, confronted with some very, very difficult air quality regulations here and in the Los Angeles Basin. The Bay Area Council with the Bay Area Economic Forum just finished publishing a report titled, "Market Based Incentives to Achieve Air Quality and Mobility." The whole intention behind that is that we are trying to reduce the automobile emissions.

We take a look at the regulatory approach. We see that there will be some dramatic changes in lifestyle. We would like to believe that those changes could be effected in other ways. That is, to create financial incentives or disincentives for people to behave differently; for people to stop driving to work alone. Those are themselves rather onerous when we are talking about a rather large gas tax increase or bridge toll increase or a smog fee or whatever else it is. We know that those things get quite onerous and very politically unpopular, but as we take a look at that versus the regulatory approach if, in fact, people in public policy do want to achieve air quality improvements, we believe that a market based system is a valuable one.

A market based system is a system of leverage and I would ask the Federal Government to engage in three different kinds of leverage:

The one that we have been talking about and that is to lever Federal money to improve both the state and local matches for transportation improvements.

Secondly, to lever your resources, both money and other, to accomplish what I talked about. That is, to deter single occupant commuting. There is no doubt that we could spend an awful lot less money if we can use the system better and using the system better

means promoting a system where people will choose not to drive to work alone.

Lastly, something I think may be overlooked and that is the leverage of changing the patterns of land use. A lot of people believe that the old highway system is the culprit in creating the kind of sprawl that we have. In the Bay Area, we are severely concerned about sprawl. People in search of housing affordability have had to move further and further away from job centers. That pattern of growth has made use more dependent upon the use of the automobile. It makes it much more difficult for public transit systems to work efficiently for the kind of patronage and financing to work efficiently. Therefore, we would like you to use the leverage to make us behave differently with respect to the way we use the land—getting jobs and housing closer together, getting appropriate density near transit stations; because transit in and of itself is not the answer if you cannot develop a reasonable system of patronage. Therefore, my appeal to you—as naive as it may be—is for you to use your influence and your leverage and your money to make us behave differently in many different ways that we haven't done up to this point.

Thank you very much.

Mr. MINETA. Very well. Thank you very much, Mr. Siracusa.

Chairman Anderson?

Mr. ANDERSON. Thank you, Mr. Chairman.

Ms. Strehl, does your Association support increasing the degree of private sector funding of highways through the use of tolls? If so, do you think that the Surface Transportation Assistance Act should be amended to allow the use of federal aid highway funds on toll roads?

Ms. STREHL. That is a tough question. I am not sure I can answer it. I know as a company, that it is something that we have not looked at. So in terms of using federal aid urban on toll roads, I am not sure I can address that. I can say that our company has looked at the proposals that have been advanced by the Bay Area Economic Forum.

We believe that some system of incentives and disincentives are certainly one way of influencing people's behavior. That tolls are appropriate in terms of relieving traffic congestion. I can answer one part of the question: In some instances, we would support toll roads; but in terms of the use of Federal funds on those roads, I am not sure I am qualified to answer that.

Mr. ANDERSON. About 35 or 40 years ago, I used to be Chairman of the Toll Bridge Authority in California. We built many of the bridges here in this area and also those in the southern part of the state. We found particularly that there is very little criticism. As a matter of fact, a lot of people like the idea. Even after we collected money in tolls to completely pay for the bridges, we kept them in because it was a reasonably good source of collecting money.

I know like in my district where we had the toll bridge in San Pedro, St. Thomas Bridge; it paid for itself many years ago. There was suggestion of taking the tolls off, and people said, "No. It is the easiest way to collect." So that money goes to Sacramento every year and many of the same things do in the Bay Area. So we felt

that kind of a—not in opposition to it—a very easy way to raise money.

Now both the Bay Area Council and the Santa Clara Manufacturing Groups have a long history of supporting transportation improvements in this region.

Could you detail for the committee some of the business community's specific efforts to support development of highway and transit projects in the San Francisco, Santa Clara and San Jose regions?

Ms. STREHL. I can tell you about some of them because Lockheed is a member of both the Santa Clara Manufacturing Group and the Bay Area Council Group.

I can talk about some of the funding proposals. For instance, Manufacturing Group was very much involved in the passage of the half cent sales tax measure that was enacted in 1984 by Santa Clara County voters. Recently, both the Manufacturing Group and the Bay Area Council played an instrumental role in terms of promoting Proposition 111 which passed in June.

Angelo's organization, the Bay Area Council has long involvement with BART and trying to increase Federal funding for BART.

We have worked with the Transit Agency in terms of trying to promote some support for the light rail, both the Guadalupe Light Rail and also the Tasman Corridor Study in terms of building consensus around that project and bringing Federal and state dollars into that program.

In Santa Clara, we have been very much involved as a company and also through the Manufacturing Group in terms of supporting commute alternatives and transportation demand management; trying to encourage more employers provide ride sharing programs for their employees.

I don't know if that is sufficient. Perhaps I should let Angelo and Arielle add on to that.

Mr. ANDERSON. If they want to say something, it is fine. I mentioned you because I identified you a little more with Lockheed and I was thinking of the company's viewpoints.

Ms. Leonard.

Ms. LEONARD. Just a quick addition. The Manufacturing Group has been very active in the area of transportation demand management. Historically, it used to take a very formal role in that the Manufacturing Group organized its member companies into basically sub-groups around the County in an effort to try and coordinate ridesharing activities and ride matching activities and what have you.

We also are very active in our endorsement, if you will, to our employees of high occupancy vehicles lanes and the utilitarian purpose they have for everybody; not just the people who use them, but for the community as a whole.

So I guess the PR value of both the Manufacturing Group itself and the member companies tend to go a long way in Santa Clara County.

Mr. SIRACUSA. I would just add one more thing. This was before my time, so I won't be boasting. I don't think we would have BART today were it not for the Bay Area Council's effort in the campaign with some of the preliminary work. It was always our dream and it

38-253 O—91——78

still is our dream that BART rim San Francisco Bay. We would like to believe now that maybe with the San Mateo County agreements with the East Bay that the start of that is there and we will have BART extending to the vicinity of the airport and ultimately down into San Jose and up to Freemont.

The Peninsula Corridor, I think, is a unique one where you have got job centers at both ends of the corridor. I think that makes it especially conducive to the kind of fixed rail system that a BART system is. So the history of our involvement in BART is noteworthy and we are very strongly committed to the extensions of BART down the Peninsula and then to appropriate locations in the East and up the I-80 corridor ultimately.

That, I think, is going to be where we would put our emphasis on fixed rail extensions.

Mr. ANDERSON. Thank you, Mr. Chairman.

Mr. MINETA. Mr. Siracusa, you and I have had some discussion about the expansion of BART. Some of that is funding problems; some of it is just intra-Bay Area political issues.

Are those issues that the Feds should get into or should we just let the locals try and iron those issues?

Mr. SIRACUSA. I think we ought to iron them out. When we talk about flexibility in the reauthorization, I would think that that flexibility ought to carry into the local political debates. The debates range from growth to no-growth; going through our communities versus other communities; fixed rail versus light rail; or rail versus transportation.

I suspect that we are not unique in those debates. We might be a little more parochial than a lot of other regions, but I think that we are going through the same battles. I am inclined to believe that ultimately the people of the Bay Area will speak very strongly on behalf of those kinds of transit extensions.

The transit seems always to help carry votes for gas tax increases or toll increases, so I think conceptually, people are strongly committed to transit. Hopefully, the "not in my backyard" syndrome where maybe rail systems might close to existing neighborhood—hopefully, they won't get in the way.

But in answer to your question, I think those are political battles that we need to fight within our own borders.

Mr. MINETA. You were talking about your three levers, one of them being changing land use patterns. Let's say if the density of our land use pattern is seven to nine dwelling units to the acre, but that is not enough to make mass transit really pay for itself. Maybe it would be 22-25 dwelling units to the acre.

But I bet, having sat here a number of years ago and trying to deal with land use applications at the city council level of 22-25 dwelling units to the acre, I bet this room would be filled two times over with people protesting that kind of density in a locality. Yet, to make transit work, we know we have to increase land use density.

Mr. SIRACUSA. Well, you are touching on——

Mr. MINETA. You are not saying that we at the Federal level ought to be dictating what those land use patterns should be at the local level, are you?

Mr. SIRACUSA. I remember in the late 50's when we were first pushing on trying to get BART passed in the Bay Area, we invited the mayor of Toronto to come down and he showed us a wonderful, panoramic picture of the Toronto landscape. You saw these clusters of high rise buildings; and you knew that every time there was a high rise building, there was a subway station under that. I would be inclined to believe that while we don't need high rises; that if we would only be able to have 20-30 units per acre in and around rail stations—not for the community as a whole—and be able to therefore, have the rest of those communities 7-9 units per acre, we could do a much better job of promoting patronage. Maybe not the kind of densities that New York or San Francisco has, but certainly better than what we have got right now. The current development patterns are four units per acre. That is not conducive to any kind of public transportation use.

Mr. MINETA. That is an interesting point. If it is increased by local governments around those stations—let me ask the panel. Should there be some value recaptured back, so that we can pour it back into the transit system?

I mean, after all, if we could increase the land use value because of the density being 18-20 dwelling units to the acre, that is an increase in the value of that land; or the surrounding commercial entities that move in—should there be some value recaptured so that we could then pour it back into further transit kind of operation?

Mr. SIRACUSA. I would say absolutely. I think there is nothing wrong with either air rights or excess condemnation. There is a windfall by virtue of that facility being there. There is no reason why the agency creating the windfall shouldn't derive some benefit from it. Joint ventures with private developers—I am sure that many developers would be very happy to engage in those and give some of the marginal benefit to the agency. I think that makes very good public policy sense.

Mr. MINETA. Interstate defense highway systems, as we know it, will be completed in 1991—roughly 43 miles of highways that we will have completed.

What we have done, I think is to build a very good system from let's say City A to City B; City B to City C. But once we get to City A or once we get to City B or once we get to City C, forget it. It's terrible. Forget it.

Now, maybe that was the intended purpose of the interstate defense highway system; to be able to move you in a interregional basis. But that the local movement of traffic was left to the locality to do, but they did not respond and consequently we have a federal aid to urban system, we have a primary road system, a secondary road system.

Even though you talk about the retaining the commitment from the federal funds, should we be restricting what those federal funds might go to in order to put more of the program responsibility on the local agencies in order to do that. Local movement of traffic, or maybe increase the amount of flexibility for highway funding to be able to be used in the transit area.

Any reaction?

Mr. SIRACUSA. I tend to be very parochial at the regional level and, therefore, I would like you to give us the money and let we, at

the region, decide how it should be spent. But there is implied in that that somebody at the regional level must mandate something at the local level because otherwise the difference between the bay area and Toronto, is not that the market would not have liked to have had some of that density, it was that each local government said it is not in our own community's best interest to have that kind of density.

That is the sort of thing that has created, I think, this for all and created the resistance to certain types of infrastructure improvements, and, therefore, somebody at regional, or state, or federal level should create a system of incentives that would change the behavior of local government on this.

Mr. MINETA. But you would be comfortable as an MPC commissioner in making those kinds of——

Mr. SIRACUSA. Absolutely. Of course, I have the luxury of not having to run for public office, but, yes, I would be very happy to.

Ms. LEONARD. Right. I would simply add Mr. Mineta, I believe that we are talking about using federal dollars here as an incentive for a regional picture that ultimately makes sense and a local picture that ultimately makes sense in the context of the region, in order to provide the incentives for cities to make the kind of land use decisions that are conducive to transit usage.

Ms. STREHL. I am not sure I have anything to add. I concur with both what Angel and Arielle have said.

I would also say that the interstate now probably functions more not from city to city so much as it does from region to region. And some parts of this region are blessed with more interstate than others.

If you go out to Contra Costa County, there is a lot of interstate and they have had a lot of funding—federal dollars. And in this county we have had less federal funding, in part as a result of the interstate.

In terms of our economic vitality, it requires a blend of both federal, and state, and local funding. I think it would put us in great jeopardy—I am not sure that we could achieve what we need to do in terms of congestion management as well as air quality—without a federal role in terms of funding and allowing us the flexibility to determine how those dollars are spent to meet those goals.

Mr. MINETA. I am not sure what Lockheed's program involves. I would imagine at the federal level, we will have some kind of a tax bill this year. I would quote that part of your program will be to increase the $15 that is available to the employees right now in terms of commuter passes. At the sum the increased—I do not know. Hopefully maybe to 45, $60. In terms of what that commuter can be written, you know, how much——

Ms. STREHL. You are talking about the gross income tax exclusion?

Mr. MINETA. There is a bill in Congress now I believe, yes. Congressman Matsui or Chuck—has a bill. And I believe his is for $60. I am not sure what Santa Clara County's monthly commuter pass is, but in any event, I would hope that Lockheed's program would include pushing that as part of the program.

Ms. STREHL. Well, we certainly support that bill, if that is what you——

Mr. MINETA. You do support that bill?

Ms. STREHL. Yes, we do.

Mr. MINETA. Okay, fine. Let me ask, very quickly, about the—is there a lawsuit involving the clean air act here in the bay area and what is the status of that right now?

Mr. SIRACUSA. The citizens for a better environment in the Sierra Club have brought suit against the Metropolitan Transportation Commission and the Air Quality District on the basis that the freeways authorized by MTC have deteriorated air quality of both federal and state standards, and, therefore, some different criteria for determining air quality effects of transportation projects are to be determined.

That suit has been the—Judge Felton Henderson has ruled for the plaintiffs on it. There is, I think, a next step and I honestly do not know where we are with respect to that. MTC believes that it has developed a planning process to deal with that and we hope to have something very soon.

Mr. MINETA. And, let's see, Ms. Leonard, let me ask—earlier I had asked about when the—let's see, who was here from—Mr. Evanhoe was here from the Golden Triangle Task Force. He mentioned that Santa Clara was not a member of the task force, but I assume that you have member companies that are in that area of the city of Santa Clara that a part of that Golden Triangle Task Force. And what are the companies that are in that Golden Triangle Task Force area, but since Santa Clara is not a part of it; what are they doing in complying with some of the—to help alleviate the traffic congestion in the Golden Triangle Task Force area?

Ms. LEONARD. The city of Santa Clara, although it is not a member of the Golden Triangle, does have a transportation demand management program and it is city-wide. It is, however, intended to be a voluntary effort on the part of businesses and employers. And, essentially, it requires an annual report, or requests an annual report, on the status of ridesharing at each company to be submitted to the city once a year and there are no other mandatory requirements in terms of a rideshare program per se.

However, I have been encouraged in recent weeks by the number of phone calls I have received from the employers in the city of Santa Clara I think they see the writing on the wall. I think they have read in the newspapers not only is there our local Golden Triangle effort going on, but at MTC, with the establishment of regional transportation control measures, there has been quite a bit of discussion as to what the role of employers is going to be in addressing the transportation problems. And, so, I have had a number of large employers call me and say, okay, the time has come, what do we do?

So I am very encouraged by that, although there is no particular requirement as yet, in that city.

Mr. MINETA. Now is that as a result of a passage of the clean air act here in California and the 35 percent requirement in the next seven years?

Ms. LEONARD. That is the reason why we have been discussing the establishment of regional transportation control measures.

Mr. MINETA. So that even the voluntary efforts of the city of Santa Clara become moot, maybe——

Ms. LEONARD. They may be, that is correct.

Mr. MINETA. Well, again, thank you very, very much for the presentation of all three of you. You have been leaders, your associations have been leaders, your company is a leader. I just want to thank you very much for being here. Thank you very much.

I now would like to call on Dr. Craig Philip, Vice President, Intermodal Division, Southern Pacific Transportation Companies.

Before Ms. Leonard gets away, could I ask who is the chairman of Santa Clara County Manufacturing Group now that Bob Kohler is gone?

Ms. LEONARD. He is still the chairman until the end of this year.

Mr. MINETA. But has he not moved down through—because I could talk to his boss Jerry Guismar, and I thought Jerry had indicated that Bob was down was down south.

Ms. LEONARD. Yes. He has been relocated by his company to southern California. However, he is serving out this term which ends, I believe, in October.

Mr. MINETA. Thank you, very much.

Dr. Philip, sorry to interrupt here. Your full statement will be made a part of the record. Go ahead and proceed.

TESTIMONY OF CRAIG PHILIP, VICE PRESIDENT OF THE INTERMODAL DIVISION AT SOUTHERN PACIFIC RAIL ROAD, ACCOMPANIED BY LEE WAYNE, EXECUTIVE DIRECTOR OF AAR INTERMODAL POLICY DIVISION

Mr. PHILIP. Thank you, Chairman Mineta, Chairman Anderson. Thank you for the opportunity to speak before you this afternoon.

My name is Craig Philip, I am Vice President of the Intermodal Division at Southern Pacific Rail Road. The SP system includes 15,000 miles and 23,000 employees in 15 states. But we are the largest railroad in California with more than 6,000 miles of track and nearly 10,000 of our employees.

I am accompanied this afternoon by Lee Wayne, Executive Director of the AAR's Intermodal Policy Division. I will briefly summarize my written testimony and be happy to answer any of your questions.

I am here this afternoon to express Southern Pacific's deep concern with the possibility that the 1991 highway bill will authorize the operation of longer, heavier trucks. So called "longer combination vehicles," or "LCV's." Among the LCV combinations being sought by the trucking industry are triple 28 foot combinations and twin 48's.

For a railroad like the Southern Pacific, the LCV threat is, if anything, even more ominous for the railroad industry as a whole. Unlike some other carriers, Southern Pacific does not carry a large amount of bulk traffic such as coal or grain, which is not suitable for trucks to haul.

We provide the long haul service for containers and trailers that would otherwise be carried on our highway system. Unfair competition from longer and heavier trucks would take this traffic off the Southern Pacific and put it on the public highways. The consequences for the California transportation system in our view would be disastrous.

Not only would the state lose an important part of its rail service, but truck traffic would soar, and already severe highway congestion would become worse. Imagine the impact if the several hundred thousand containers that we handle each year to and from California ports were moved suddenly and permanently from the railroads on to California's freeway system.

Safety, pollution, and energy consumption are but three of the reasons that traffic should not be diverted from rail to truck. Railroads are more than three times safer than current combination trucks on a fatalities per ton mile basis. Diverting freight from rail to truck inevitably increases accidents on the highway system.

For example, in California, where two 28 foot double trailer operations are more wide spread than in the rest of the country, trailer doubles are involved in 83 percent more fatalities per mile than our single trailers. A fatality rate of 9.6 deaths per hundred million miles. In fact, 86 percent of the public believes that longer trucks would be less safe than current combinations according to a recent opinion poll on public attitudes toward higher truck sizes and weights conducted by Frederick Schneider's, Incorporation, for the Association of American Railroads.

LCV's also raise serious environmental question in addition to their effects on safety. Increased reliance on environmentally superior rail transportation could alleviate the growing environmental problems generated by rapidly rising levels of truck traffic and congestion. For example, railroads produce far less air pollution per ton mile of freight moved, and the relatively self contained nature of rail facilities tends to lessen other pollution problems as well. And compared to trucks, railroads are nearly three times more fuel efficient.

Finally, U.S. competitiveness in international markets will be affected by widespread use of LCV's. The fastest growing segment of business for U.S. rail-carriers today, and especially for Southern Pacific, involves the movements of containers between interior points in the United States, and ports on the west coast. Especially here in northern California and in southern California.

These containers are carrying the import goods, especially from countries in the far east. But even more important, they are carrying the export products of our manufacturers here and throughout the United States that are sent over seas. Last year Southern Pacific handled more than three quarters of a million, more than 750,000 such containers handled in international freight to and from the U.S.

Long Combination Vehicles can have a significant and negative affect on our ability to handle this traffic economically and to continue making the investments in our infrastructure which are necessary to accommodate the long term growth of this market. For example, Southern Pacific in partnership with the ports of Long Beach and Los Angeles, has invested more than 150 million dollars in a single terminal in southern California that is specifically designed to handle this traffic. And plans for a similar facility are underway, here, in northern California.

All of this growth, which has had particular benefits for the state of California, has been accomplished without adding burden to an already overburdened highway system. Endorsing longer combina-

tion vehicles turns away from this efficient and pro-competitive history.

So, in summary, highway congestion and its related safety problems have a readily available and low cost solution. A policy of retaining present federal truck size and weight limits, will continue to encourage long distance freight to move on an under utilized, privately owned railroad system. And, more efficiently and effectively, use an already saturated public highway network.

Thank you, very much.

[The prepared statement of Mr. Philip appears on p. 2618.]

Mr. MINETA. Thank you, very much, Dr. Philip.

Dr. Philip, are you supportive of a national prohibition of longer combination vehicles in all areas, including states where they are currently allowed; or just to prevent additional use of LCV's in states where they are currently not permitted?

Mr. PHILIP. I think our primary thrust is on the addition and encroachment of additional uses of longer combination vehicles. Obviously, the arguments that I have made with respect to the desirability of not having them would apply equally to their use currently, as well as to their perspective use where they are not allowed today.

Mr. MINETA. We have been told that fatal truck accidents have declined by some 40 percent in the 1980's. What is your opinion of the view we have heard from some that allowing more capacity per truck might further reduce truck traffic, and, thus reduce fatal truck accidents overall?

Mr. PHILIP. Well, I think there are two facets to my answer. The first is that the rail system has also achieved remarkable improvements in its own safety. And I think our safety record speaks for itself. We are the safest transportation system in the United States. While it may be true that you could reduce in the short run the number of units traveling under a combination vehicle system, the evidence does suggest that longer combination vehicles are involved in more accidents on a per unit basis. And it is also, we believe, to divert traffic that is currently moving over rail to the highway. So the effect and the reason that the trucking industry may be so interested in longer combination vehicles, will be to actually add to the numerical number of trucks operating over the highway system, not a reduction.

Mr. MINETA. Now you are advocating that the fuel taxes should be restored to their real 1984 values. And I am wondering if we do that, whether or not some would advocate then the—let's say, as long as you are going to require me to pay more in gasoline taxes, then I ought to be able to get some productivity gains out of this and wouldn't that, then, force us into something like the LCV's?

Mr. PHILIP. Actually, rather than saying that we advocate a restoration to the 1984 levels; I did use that in my testimony to illustrate what has happened to fuel tax levels historically, especially in the last decade. We have basically in the Association of American Railroads has advocated not changing the fuel tax structure on trucks and we would also be willing to endorse that.

Mr. MINETA. One of the problems vexing us, I think, is this whole issue of design specifications on the highway, design light, and whether or not the highways are breaking up before the de-

signed life is attained. Part of that is maybe construction, but part of it is overweight trucks on the road. Part of that is also the fact that containers coming off of ships, then be putting on rail beds and then being transferred on the road to some rail head, that we really do not know what the weight of those containers are. There is no one doing that. Who should we look to in terms of—as to who ought to be responsible on making sure that those weights on those containers are not in excess of the state highway loads?

If we say to the shipper, who may be a merchant in Bangkok, they says, hey, do not look at me. We say to American President Line, and they say, hey, hold it, do not blame us. What about Roadway, Viking, any trucking company. Who do we look to? Everyone says, hey, look to the other person. They have all washed their hands of it. And, yet, these containers are very heavy, maybe, because people are renting, leasing containers. And whether they put feathers in there or they put steel ingots, you know, eventually, somewhere, it is going to be on the road. And we have no idea how much those things weigh and somehow we got to get a handle on it.

I am wondering if you could help us out on that?

Mr. PHILIP. Well, you talked about vexing problems that the committee faces. It is certainly a vexing one for us, and I know for your committee as well.

The Southern Pacific was recently an advocate of the proceeding before the Federal Maritime Commission, that you may be aware of, where there was a request were made by the American Trucking Association and many other ocean carriers with respect to the overweight issue. And the Federal Maritime Commission elected not to act on the issue, suggesting, instead, that it was more appropriately handled by the—by other domestic agencies in the United States directly.

It is not a problem that we have an easy answer to. It has become more difficult as we have had more shippers from Bangkok, and Singapore, and elsewhere who are sending freight to our country. We certainly feel that the shipper has to be brought into the loop and made accountable for the product that he is putting into the container. One of the specific proposals before the Maritime Commission was to change the way tariffs are structured on the ocean side, so that boxes would no longer be sold on a per unit basis, but would instead—freight would be sold on a per weight basis. So there would no longer be an incentive from the shipper's point of view to load more cargo into an individual container. We certainly endorse that as one solution, and perhaps we will find another one now that the Federal Maritime Commission has elected not to act on this issue.

Mr. MINETA. Thank you. Let me ask, Chairman Anderson?

Mr. ANDERSON. Sure. Thank you, Mr. Chairman.

What studies do you rely on to show that longer combination vehicles are unsafe?

Mr. PHILIP. Well, the studies that we have relied on are comparative studies that look at accident rates and statistics in different states by the type of vehicle. I would like to ask Mr. Lane, from the Association of American Railroads, if he would like to comment because he is more familiar with those than I am.

Mr. LANE. Mr. Anderson, one of the studies on which we rely is a new one, which has just come out. I do not think that anyone on the committee has yet had the opportunity to see it, but I would be glad to share it with the committee, and present it to you for your perusal. It is one that was just finished in the last week or so.

Mr. ANDERSON. It has been rightly acknowledged, even in testimony here today, that many studies on the safety of longer combination vehicles are flawed for a variety of reasons. And would you support a congressionally authorized, broad based, sound study of the relationship between LCV's and safety, by a credible research organization in the next highway re-authorization bill?

Mr. PHILIP. Absolutely.

Mr. ANDERSON. Thank you, Mr. Chairman.

Mr. PHILIP. Very good.

Mr. MINETA. I have no further questions. Counsel, if you have no further questions, Dr. Philip, Mr. Lane——

Mr. PHILIP. Mr. Chairman, thank you.

Mr. MINETA [continuing]. Thank you, very, very, much.

Now I would like to call on Dr. Val Selivanov, Associate Director of Trauma, San Jose Medical Center, and member of the Crash board of directors.

Doctor, your statement will be made a part of the record, and so if you would proceed in your own fashion, sir.

TESTIMONY OF VAL SELIVANOV, ASSOCIATE DIRECTOR OF TRAUMA, SAN JOSE MEDICAL CENTER, AND MEMBER OF THE CRASH BOARD OF DIRECTORS

Dr. SELIVANOV. Thank you. Congressman Mineta, members of Congress, ladies and gentlemen; I thank you for this opportunity and privilege to address you on these issues.

I am a physician and surgeon whose major interest professionally has been the care of injured victims. I am a so called "trauma surgeon." For the last three years I have been the associate director at San Jose Medical Center, one of three trauma centers here in Santa Clara County.

Recently, I have had an opportunity to return to academic surgery and I have been appointed the acting director of trauma at Stanford University.

As you deliberate on these complex national, and, possibly, even global issues; I would like to share with you a perhaps limited perspective of a practicing trauma surgeon to help you decide on the safety issue of some of the issues you are dealing with.

In Santa Clara County, in 1988, there were 538 injuries due to large truck collisions and accidents. There are 14 deaths recorded. Those 538 injuries, I would like to share a little perspective on what they are like.

In solo truck rollovers, or truck alone accidents, the driver is usually, miraculously, not injured at all if he is wearing seat belts, and the injury occurred in fortuitous circumstances with the acci-

dents, or, he is outright crushed and dead at the scene. I begin to be involved with them in the in-between stages.

In truck-auto accidents, there are usually multiple victims. There are certain types of problems that a physician in a health care system faces. First, there is the problem of extrication. Many of the victims are pinned and one cannot easily bring them to the ambulance in order to bring them to the trauma center. During the time that they are pinned, vital tissues are being crushed: muscles, chest walls, pelvic girdles. There is a higher percentage of severe injuries when these injuries do occur in these types of accidents.

When I say a extrication problem, people can actually bleed to death while the paramedics are trying to extricate them. Or, bleed so sufficiently, that even though they have become survivors, they have survived after a prolonged, expensive hospital course of months. And a rehabilitative course of months at home and outpatient.

There is another issue, and that is the intrusion. When a massive object strikes a less massive objection, things collapse and cave-in. Two to three foot intrusions are not uncommon in auto-truck collisions. If you would, for a moment, identify with what that would be like in the passenger space of your own automobile. And I will take it one step further, and without meaning to be gory, or macabre, the intrusion occurs into the chest wall, or into the abdominal or into the cranium. If it is in the cranium, from my point of view, there is very little problems, those victims are dead at the scene.

A three to four inch intrusion of something, some force, through a chest wall, leads to a crushed chest syndrome. Even if the patient survives the first day or two, they are almost guaranteed a month to two months on a ventilator, a breathing machine in an intensive care unit. And often times they succumb to the complications of infection, renal failure; a number of modus exoduses from the health care system and the planet.

After doing this type of work for a number of years, and hoping that we are becoming more proficient and better at it by having better systems design, such as the one we have in Santa Clara County, which, by the way, is not available in all counties in this state and certainly not available in all places of the United States. By learning more, by doing basic research, we are able to salvage a few more patients each year, or, so we think. But after a few years of involvement in this work, it becomes quite clear to me, that there is an upstream problem. I am pulling bodies out of the river and perhaps my reach is getting better, but at a certain point of time one has to step back and say, who is throwing the bodies in upstream.

Injury prevention becomes a major focus of a trauma surgeon's activity after he has been involved for a number of years. In this light, I am here to speak to you about my fears of erosion of safety benefits of our interstate highways. One of the potential areas in which the safety benefits of our excellent highways occur, is with the long combination vehicles. You are asking if there is evidence to show that they are better, safer, or equal to what we currently have; I, myself, have asked that question. It is not an easy question to ask, the answers are not easy. There are tombs of papers. Mostly conflicting, some are out and out poorly designed. I would like to

quote on paper what I found convincing for myself. This is an elegantly designed paper by Stein and Jones, and it was published in the American Journal of Public Health in May of 1988.

The key data is summarized in this graph. This study compared collisions of truck trailer, the standard semi-truck, one trailer and a tractor pulling it; to single unit trucks without a trailer, and to the multiples. What this study has that many of the others or, in fact, I do not think any of the others have; is it is controlled for the type of road that the collision or accident occurred on. And that is crucial. One can talk about trucks turning over until doomsday. The truck is not in it alone, the truck is on a certain type of highway and if you had a truck of a certain design on an excellent highway, its rate of turnover will be less than if that truck is on a poorly designed highway.

This study attempted to compare multiples turning over on interstates, and multiples turning over on non-interstate, less safe, roads. In this study there were multiple trucks turning over when you control for the type of road two to three times more than single trucks, the so called standard tractor-trailer. To add a little sense of science to it, the authors of the study also did some statistical analysis. Is this just a random trend, after all, there were only 600 some collisions that were studied, only a 1,000 some other control trucks that were looked at that traveled the same roads. It turns out that they used a good, statistical analysis and this study is statistically significant.

The two bars at the top are statistically more involved in accidents than the middle one, which is the truck trailer, and, obviously, more than a single unit. This type of study has convinced me that doubles, which is all that this study addressed; are two to three times at risk for turnover and collision and being involved in accidents than the standard tractor-trailer rig.

There is not, to my knowledge, any large study with enough trucks and enough collisions or accidents on triples. However, I think the extrapolation is clear. Also, to help me, I have talked with a few drivers, and even though that is anecdotal, they fear that the triples are a little harder to manage and a little less safe.

I do not need the extra work in the trauma centers. The other issue is when an accident occurs—and accidents will occur, even under the best designed circumstances such as this accident which occurred near Portland. There will be multiple victims. For me, the analogy is as if it is not just one gun shot wound, but someone was shot with an automatic and there is multiple victims with multiple wounds. The severity of any individual is greater, and there are more victims.

In this accident, there was one fatality at the scene. From my point of view, that is easy, we cannot help that victim. But there were seven other injured. If all seven were to descend upon any one trauma center in the state of California, that trauma center would be swamped. In a well designed county system, or regional system, and maybe two trauma centers would receive these victims, for that day, that trauma center would probably be closed to all other traffic.

The costs in paid and economic loss of even one accident are severe. As a member of CRASH, my interest are in preventing in-

juries and deaths on our highways. I do not have hard science and proof. This is not astronomy or physics, but I think there is enough evidence to suggest that the multiple trailers will erode some of the safety benefits we are trying to have in our interstate system.

Thank you.

[The prepared statement of Dr. Selivanov appears on p. 2646.]

Mr. MINETA. Very well. Chairman Anderson?

Mr. ANDERSON. There has been some thought that with the commercial driver license, having now been imposed, that with a tougher requirement to the commercial driver license on those who would be driving triples, or doubles, 48's; that this may be a way to control whether or not better drivers would be driving these larger, longer combination vehicles.

Do you have any thoughts on whether that would even work?

Dr. SELIVANOV. Well, I think that that is a question that is in the nature of a hypothesis. And, unfortunately, I think I would be afraid to conduct the experiment. The record of maintenance and the ability to enforce maintenance is not sterling as of now.

In Santa Clara County, the California Highway Patrol cited 75 percent of the trucks they randomly pulled over, in a recent study, and 30 percent of those trucks were forced off the road because of various maintenance problems. I do not think it is just the drivers, and you give the most excellent driver a difficult job to do, there will be problems. In a sense, it is sort of like surgery.

There are complications that occur in everyone's surgical practice. We try to limit them, but if we are given a steady diet of horrendous type cases, our complication rate will increase no matter how good a surgeon you are.

And I think the same situation will apply to the drivers, that even the best drivers, if they are asked to drive a vehicle that may be a little less safe, will have a harder time with it. And as the number of these vehicles increase, I think, even with excellent drivers, you are going to see an increase in accidents.

Mr. MINETA. Let me ask you a question I asked earlier of the Vice President of the Intermodal Division of Southern Pacific Transportation Company, and that is: are you, as an organization, is CRASH advocating for a national prohibition of longer combination vehicles in all areas, including states where they are currently allowed; or just to prevent use of LCV's in states where they are currently not permitted?

Dr. SELIVANOV. Well, as a member of the board, I have not polled my board members. But as an individual trauma surgeon, I think if it is safe in one place and not safe in another, why not have all the citizens have the benefits of the safety and, for myself, I would like to see these vehicles studied and not allowed.

Mr. MINETA. Dr. Philip, I have a number of questions which Congressman Packard would like to have answered for the record and so these will be submitted to you in writing and so if you could respond, for the record, in writing, I would appreciate that very much.

Mr. Chairman, any further questions? If not, thank you very, very much, Doctor, for the presentation.

Dr. SELIVANOV. Thank you.

Mr. MINETA. I would now like to call forward Gerald D. Gibney, Vice President, ICF, Kaiser Engineers.

TESTIMONY OF GERALD D. GIBNEY, VICE PRESIDENT, ICF, KAISER ENGINEERS

Mr. GIBNEY. Mr. Chairman, members of the committee, ladies and gentlemen; my name is Gerald Gibney, I am Vice President and Regional Manager of Transportation for ICF Kaiser Engineers. I am based in Oakland, I am also a Director of the Consulting Engineers Association of California, and a member of the American Consulting Engineers Council 7-10 Committee on Transportation at the national level.

Others, with more eloquence, have testified on issues which affect the entire spectrum of engineering such as employee commuting, air quality, and business travel. We all agree this nation's infrastructure is decaying and we are attempting to determine what we can do about it.

But most testifiers have mentioned the passage of prop 108, and 111. The people voted for those increases because the leadership of this state, public and private; was united in recognizing the need and in devising a plan. The engineering community was a strong supporter of the propositions and made material contributions of time, money, and other resources.

On the national level, we intend to work with the leadership of APDA, ARPA, and the Consulting Engineers Council to affect the national transportation plan. We are opposed to the sequestering of gas tax funds. It is even more short-sighted in our view to speak of using the gas tax to reduce the deficit. An increase in the gas tax is necessary for the purposes for which it has traditionally been used: investing in the transportation system. The investment is needed now, because if we delay, the future costs will be even greater.

Mr. Chairman, you and your colleagues, and the staff of the Committee on Public Works and Transportation have worked hard with the California Department of Transportation to devise California's recommendations for the post interstate program. You are acquiring testimony from a wide spectrum of local government and industry through these hearings.

The business community is confident that the state congressional delegation will listen and will make itself heard on the hill. We urge the Congress to stand firm in this critical time of defining the future of surface transportation, all modes, for the nation.

As a representative of the private engineering community, I would like to address three issues of particular concern to us. First, the private sector engineering design is our reason for being in business. The private sector is a reservoir of engineering talent that is innovative and cost effective. California has increased it's use of consulting engineers in recent years, and increased contracting out, has brought new resources to capital project delivery. The fast response capability of the private sector was particularly evident in the aftermath of the Loma Preita earthquake, when our capabilities were quickly brought to bear.

Mr. Kempton spoke earlier, about the ability of the private engineering community to produce quickly in cooperation with—and two—standards.

Second, we applaud Congressional efforts and your personal efforts, Mr. Chairman, to improve business conditions and promote fairness in the provision of engineering services. Qualifications Base Selections, QBS, in accordance with the Brooksville, is vital to the best interest of both the public and private sector. The marginal cost of procuring quality engineering services, as opposed to unqualified services and low ball bids, is minuscule, in comparison to the benefits which accrue and the cost of the disasters which are avoided.

Third, we support the privatization of transportation facilities and systems where it makes sense. Privatization is not a panacea, but it is a viable means of unleashing resources which are badly needed in this country. Entrepreneurial innovation, using private capital, to augment the public system, to improve safety and capacity, makes sense for America.

Thank you for the opportunity to be heard. I take pride in my profession, the private sector is capable, responsive and of great value in a design of transportation facilities and systems.

I sincerely appreciate your attention. Thank you.

[The prepared statement of Mr. Gibney appears on p. 2588.]

Mr. MINETA. Thank you very much, Mr. Gibney.

Chairman Anderson?

Mr. ANDERSON. Thank you, Mr. Chairman.

Mr. Gibney, doesn't qualifications-based elections inevitably involve subjective judgments, and what criteria are used to ensure objectivity that the best engineering services are procured?

Mr. GIBNEY. In the development of the Caltrans selection process, the concern about subjectivity of the use of judgment by the committees was of concern to some members of the legislature and to Caltrans. We worked with Caltrans to devise measurement of experience and qualifications, appropriateness of the experience to the project at hand. We did not entirely remove judgment, nor, do we think you ever can.

Mr. ANDERSON. Well isn't qualifications base selection biased against the smaller, new firm that may be able to come in legitimately with a low bid.

Mr. GIBNEY. Newness and smallness do not necessarily reflect negatively on qualifications, and the opportunity to come in with a lower bid is an invitation to create a very serious situation.

Mr. ANDERSON. Thank you, Mr. Chairman.

Mr. MINETA. Thank you, Mr. Chairman.

Mr. Gibney, ICF Kaiser Engineers is strictly an engineering company, do you do any construction work?

Mr. GIBNEY. We do engineering and construction management, Mr. Mineta. We, for example, are program managers for the I-595 project in Florida. We do not construct, but we manage construction.

Mr. MINETA. You have not been involved in any turnkey kind of operations?

Mr. GIBNEY. We have been involved in turnkey operations for the Department of Energy and the Department of Defense, but not for transportation. However, those areas are outside my expertise.

Mr. MINETA. Have you worked on any toll roads?

Mr. GIBNEY. We are working on the design of toll roads. We have looked at the opportunity that is represented by the AB-689 program. An unfortunate death in our partner's firm caused us to withdraw from that program.

Mr. MINETA. Now, the one that you had been involved in terms of the toll road, that was where?

Mr. GIBNEY. In Orange County where toll roads are under design. That program is considering changing to a combined design construct approach. We are assessing whether we can play a role in that program.

Mr. MINETA. As I understand it, in San Diego County, is there not a—some toll road under consideration there, with Bechtel, I believe it is?

Mr. GIBNEY. In San Diego County, there are a number of opportunities that are being explored as part of the—what I call the AB-689 program. State Assemblyman Baker has an approved bill for four demonstration projects for privatization. I believe you may be thinking of one of those. There is no other in San Diego County that I know of.

Mr. MINETA. The four projects are two in Orange County, one in San Diego, and do you know where the fourth one is?

Mr. GIBNEY. Perhaps I am confusing the committee. There are three toll roads in Orange County that were mandated or approved by the legislature. In addition to the Orange County toll roads, there is the opportunity for four demonstration projects to be entirely funded by the private sector that would parallel state routes.

At least one of those projects has to be in southern California and at least one in northern California. They are not yet specifically defined.

Mr. MINETA. Have you heard of whether or not the Corps of Engineers is trying to get into any of these projects?

Mr. GIBNEY. The Corps of Engineers has been involved in transportation around the country. They were responsible for the management of construction of the west Seattle bridge in Washington. I am not aware of any efforts by the corps to become involved in transportation in California.

Mr. MINETA. And I take it ACEC's position would be to be in opposition to that approach?

Mr. GIBNEY. I believe that ACEC would be in opposition to that approach primarily because government organizations have an unfair advantage in competing with the private sector, and I do not believe there is a need for the corps to become involved in that area.

Mr. MINETA. Very well. Well, thank you, very, very much Mr. Gibney for being here to testify before the subcommittee. I appreciate your help very much.

Mr. GIBNEY. Thank you.

Mr. MINETA. Now, I would like to call on Ronald Pelzel, the Executive Vice President of Viking Crane. I have a blue and white truck sitting on my desk.

Mr. PELZEL. It is still there. Great.

Mr. MINETA. It is still there; it has not driven off the end of the table. I have been trying to figure out, Ron, what the wing span of that truck is. But Stach, the person at the company, has not told me what the wing span is.

Mr. PELZEL. I think Randy could help you with those calculations.

Mr. MINETA. Right. Your statement is going to be made before the record, so if you would go ahead and proceed.

Mr. PELZEL. Thank you.

TESTIMONY OF RONALD PELZEL, THE EXECUTIVE VICE PRESIDENT OF VIKING FREIGHT, ACCOMPANIED BY TIM LYNCH, ROADWAY SERVICES, INC., AND MEMBER, ATA TASK FORCE ON INCIDENT MANAGEMENT PROGRAMS

Mr. PELZEL. Thank you for the opportunity to testify today. Randy Vaughn, our President, did want to be here today, but unfortunately he had a conflicting business commitment that he could not change.

Randy was the Chairman of the ATA Task Force on Incident Management Programs. And with me today, is Tim Lynch, who also served on that Task Force.

I would like to talk about Viking for just a moment to give you some background. Viking Freight is a ICC certificated motor carrier. We handle general commodity freight, primarily, in business we are an LTL carrier, Less Than Truck Load. We operate 1,400 power units, and 4,600 trailers, and we employ about 4,000 people. Our primary operations are in the western United States, and, last year, we traveled over 58 million miles on the highways in the west United States.

I am here today to present to the committee our perspective on re-authorization of our nation's highway program. While our concerns cover virtually all aspects of the highway program, I will limit my comments to just three areas.

First, the need to continue a strong Federal role in our highway system.

Second, the need to maintain the integrity of the highway trust fund, and the taxes supporting that fund.

Finally, the need to address the problem of urban congestion through greater federal, state, and local cooperation on incident management programs.

I do not think anyone today seriously questions the important role that transportation and, specifically, highway transportation; plays in maintaining our nation's economic well being.

In the introductory statement accompanying his national transportation policy initiative, DOT Secretary, Sam Skinner, stated, and I quote: "No industry in the nation is more important to U.S. economic growth and international competitiveness than transportation."

While we might expect such words from a transportation secretary, further evidence was offered from a source not normally associated with highways and transportation. Mr. David Asher, a senior economist, at the Federal Reserve Bank of Chicago, put it

very succinctly when he stated recently, and I quote: "I have found there is indeed a strong and robust link between the level of infrastructure investment and the nation's ability to increase its level of productivity."

Mr. Chairman, the manufacturing, distribution, and transportation patterns of this country; make it imperative that we continue a highway program that is nation in scope and increases overall capacity. Though it may be a difficult message to convey, the citizens in California has as much at stake in out of state highways as he does on interstate highway 5.

It is our strong belief that the same motivation that went into the development and now completion of the interstate highway program must continue into the post interstate program. Our concern for maintaining a strong federal role in highway transportation is closely aligned with out second concern: maintaining the integrity of the highway trust fund and its supporting taxes.

There are certainly those who can give you a much better analysis of authorizations, obligations, ceilings, outlays, and all the other budgetary mumbo-jumbo. From our vantage point, it seems that if OMB spent as much time actually spending the money as it does trying to come up with Lou Goldberg type explanations of how there really is not surplus in the trust fund; our highways would be in much better shape. It will come as no surprise to the committee that our primary concern with the trust fund is the impending debate over raising fuel taxes, and whether those taxes should go to deficit reduction rather than the dedicated highway fund.

I can think of nothing more damaging to our highway program than allowing fuel taxes to be used for purposes other than highway related programs. One of the major arguments made in support of using the federal fuel tax for deficit reduction is the fact the tax is low; particularly relative to the levels of other industrialized nations.

Mr. Chairman, I have a hard time envisioning Japan or Germany willingly eliminating a major competitive advantage, which is precisely what we will be doing with transportation costs under such a tax increase.

It is also important to remember, that the fuel tax rate is not limited to the federal levy, but, also, includes state and, in some areas, local taxes as well. Here in the west, we are subject to state fuel tax levies as high as 22 cents per gallon. In California, voters just approved an increase of 11 cents phased in over a five year period to be used only for transportation purposes. This pattern is being followed throughout the country as approximately two-thirds of the states, and increased fuel taxes in the past three years.

I would be remiss if I did not acknowledge the efforts of this committee to resist any and all efforts to divert fuel tax increases to general funds. We will help in any way we can assist you in this battle ahead.

I would like to turn to an initiative that we would encourage the federal government to take on in cooperation with state and even local governments. That is, the development of incident management programs. "Incidence" is a term that includes accidents, and numerous other highway events like stalls, flats, spills, debris on the road, and even highway maintenance work. The American

Trucking Associations, through its trucking research institute; recently completed a year long study on the problems associated with urban congestion, and how the management or non-management of highway incidents have substantial impacts. According to FHWA estimate for 1987, incident congestion cost the nation 1.3 billion vehicle hours of delay at a loss of nearly 10 billion dollars.

A dozen large cities, Los Angeles, and San Francisco, are near the top of the list; account for over 80 percent of the freeway congestion costs. Why are we concerned over congestion and the proper management of freeway incidents? First, and foremost, these problems have a direct impact on service to our customers. Productivity, and, ultimately, our profitability. As a regional carrier, offering next day service for shippers, with just in time production runs; the margin error due to delays is very small.

Our second concern relates to the unique relationship we have with the public sharing the road. The public's perception that truck incidents are responsible for the growing level of congestion has resulted in demands for truck route restrictions, time of day restrictions, and outright bans on major urban arteries. The iron here is that many, if not all, of these proposals would result in more truck traffic, greater congestion problems, and higher costs.

The TRI study reviewed the problem of congestion and incident management programs, and made the following observations: the major impediment to the development of incident management programs, is the lack of a clear mandate. Major metropolitan areas and their traffic problems extend far beyond the city limit. For some, like New York City, or Washington, DC, the problem extends even beyond state lines.

Efforts to develop comprehensive incident management programs, having hamstrung by an inability to coordinate numerous and sometimes conflicting agencies. A small sample of affected agencies would include state police and highway authorities, local police and fire departments, private tow truck operators, hazardous materials specialists, vehicle insurers, environmental agencies, and public health officials. The cost of incident congestion, therefore, benefits, to be gained by reducing the incident delay are not well understood. This obviously undermines efforts to encourage cooperation and the development of incident management programs.

Having identified the problem, the TRI study then looked at specific incident management programs in five major metropolitan areas, and developed these findings: Incident management programs are cost effective. It is estimated that Chicago returns about $17 in benefits for each dollar invested in the program. There are real world models for developing and implementing effective comprehensive incident management programs. Chicago, Los Angeles, Fort Worth, Minneapolis, and New York all have programs that can serve as useful models for other cities.

Incident management programs are developing new tools and techniques for incident management. The development of electronic traffic controls and programs for the dissemination of traffic information show great promise for incident management efforts.

Finally, the study developed a series of recommendations for federal, state, local, and even motor carrier initiatives. At the federal level, the study recommended the following: Enacting legislation

supporting incident management as a national transportation priority. Funding to the states for the development or expansion of comprehensive incident management programs. Directing FHWA to focus research, demonstration, and training efforts on incident management. And develop methodologies for the uniform measurement in reporting of reoccurring incidents and the congestion impacts of these incidents.

Mr. Chairman, that concludes my statement. Thank you very much.

[The prepared statement of Mr. Pelzel appears on p. 2610.]

Mr. MINETA. Thank you very much

Chairman Anderson?

Mr. ANDERSON. Thank you, Mr. Chairman.

Mr. Pelzel, you talk a lot about incident management programs. Could you explain the different ways in which some states attempt to control and respond to incidents in order to keep traffic flowing, and are some methods more effective than others?

Mr. PELZEL. Tim, could you answer that question, please?

Mr. LYNCH. Yes. Mr. Chairman, under the task force study, we looked at five cities and their programs as sort of models. Let me just highlight what three of them did, and each one of them sort of highlights a separate problem and solution.

In Los Angeles, their program designates one agency, the California Highway Patrol, as sort of the coordinating agency for any type of highway incident. So when there is an incident, it is that agency that is responsible for coordinating everyone else.

New York has a program called Transcom, that attempts to disseminate highway congestion information to help motor carriers and others reroute traffic away from incidents that may occur.

Finally, Chicago has something called a Minuteman Program, where they literally send people out onto the highways during the peak rush hour periods. I think they are up to about 60 now, that just literally travel the highway and when there is an incident, they can be dispatched there quickly, make an assessment of what needs to be done, and help to alleviate the problems as quickly as possible.

Mr. ANDERSON. Well, should the next highway re-authorization bill allow for some trust fund dollars to be spent for these types of activities, and, if so, does the federal highway administration need to set up criteria for the development of good incident management programs?

Mr. LYNCH. Mr. Chairman, you have heard an awful lot of people today with an awful lot of very legitimate concerns and requests for assistance under the federal highway program. I am not sure how many dollars are in there to do all of those things.

I think what we would perhaps be in a position to advocate, is that federal highway attempt to highlight the problem of incident management, and let states and localities know that there are, in fact, programs out there that work, and that can be done, and to assist those state and municipalities in developing their own programs.

Mr. ANDERSON. Thank you, Mr. Chairman.

Mr. MINETA. Let me ask, last Sunday we went to the Department of California Department of Transportation's Traffic Control Oper-

ation Center in Los Angeles; and down there, they have all—this would be the L.A. basin? With all the interstate highway systems with traffic monitoring tapes for—or wires in the ground. And they have got remote control video cameras. I have forgotten how many. But there are 360 degrees they could zoom in and right in on incidents. They have got the tow trucks operating so they can dispatch a tow truck.

One of the big things that delays traffic in an incident, is trying to get a vehicle, truck, whatever; off the road, keep that traffic going. A lot of this was under the leadership of Chairman Anderson in getting those provisions into the Service Transportation Assistance Act of 1987.

It seems to me that there are going to be areas in which we are not going to be able to add additional lanes of—and what we have got to do is to be able to increase the flow of traffic.

And I would like to ask, with regard to your testimony where you say incident congestion costs the nation $1.3 billion vehicle hours of delay at a loss of nearly $10 billion; any idea as to what percentage of those, in either dollars or hours, are attributable to truck accidents, turnovers, things of this nature?

Mr. LYNCH. I would have to go back and look at the study. If it got into that level of detail. I vaguely recall that there was some breakdown.

Mr. MINETA. And do you know, Mr. Lynch, whether or not, let's say, if we have tow trucks patrolling, I would imagine none of those tow trucks would have the ability to tow trucks off the road. We would have to specially dispatch this kind of a truck, I would imagine.

Mr. LYNCH. I would think that.

Mr. MINETA. But you find that the incident management programs in most of these programs that you had seen are very effective in terms of increasing the flow of traffic?

Mr. LYNCH. I think the New York example, which is somewhat in its infancy, has probably done as good a job as possible to attempt to reroute traffic away from an incident.

Obviously, in the trucking industry, we have a tremendous responsibility to do all that we can to make sure that the incident does not happen in the first place, in better equipment, better training of the drivers, and so forth. And we are very cognizant of that and we are doing, I think, a very commendable job in that area. But I think, obviously, once an incident occurs, and if it is a particularly egregious incident or a nasty one, rather, that is going to be tough to deal with no matter what.

But there clearly are an awful lot of things that fall in the category of less than. I am sure we have all been inconvenienced by a truck that spills something out the back end. If that can be cleaned up quickly, it does not require a tow truck to be brought out and remove the vehicle.

So it is those kinds of things. I mean, there are certain threshold areas that we are just not going to be able to get to.

Mr. MINETA. The Chicago program seems to have a very high cost-benefit ratio. What is it that they are doing there?

Mr. LYNCH. They are putting a lot of money into the program, I guess, is probably the best way to answer that question.

Mr. MINETA. But if they are putting a lot of money in, they are still getting $17 back. So that is a very favorable cost benefit ratio.

Mr. LYNCH. I suspect, like most analysis, it depends on the dollar cost you put on people's time. And, for that particular analysis, done by Chicago—I am not suggesting they put a higher value on their time than any place else, but that is generally how those analysis are done to arrive at that.

Mr. MINETA. If, for our purposes, could you get a copy of the Chicago incident managing program?

Mr. LYNCH. Certainly.

Mr. MINETA. For us, I would appreciate that very much.

Mr. LYNCH. As well as the entire study, if you would like.

Mr. MINETA. Very well. I look forward to receiving that.

[The Report: "Incident Management", and the executive summary of that report, prepared for the Trucking Research Institute, ATA Foundation, Inc., were received and retained in the Subcommittee File.]

Mr. MINETA. I also have a number of questions that Congressman Packard would like to have you respond to for the record, and so if you could take those questions and respond for the record, I would appreciate it.

Any further questions? If not, thank you, Mr. Pelzel, and Mr. Lynch.

[The questions submitted by Mr. Packard, and responses received from Mr. Pelzel, executive vice president, Viking Freight System, Inc., follow:]

September 5, 1990

The Hon. Ron Packard
Subcommittee on Surface
Transportation
United States House
of Representatives
Washington, DC 20515

Dear Rep. Packard:

Enclosed are my responses to the questions you posed to me at the Subcommittee hearing in San Jose. I hope they are responsive to your concerns.

Sincerely,

Ronald G. Pelzel
Executive Vice President

Q. Several witnesses here today have stated their opposition to longer combination vehicles. To what extent does your company use double and triple combination vehicles and what has been your safety experience with them?

A. Viking Freight operates in eight western states. Our fleet consists of 4,503 28-foot "pup" trailers. In calendar year 1989, we operated 40,117,404 linehaul miles, of which 4,560,126 miles (9.5%) were in triple combinations and 35,557,278 miles were in doubles.

In this time period we experienced .22 accidents per million miles in triples and .76 accidents per million miles in doubles. Viking has been operating triple trailers in selected western states for seven years. Over that period of time the safety performance of triples has consistently been better than doubles, and also better than the national average for other vehicle combinations.

For the past three years our safety performance has demonstrated an average rate of .35 accidents per million miles utilizing triples as compared to .57 per million miles with doubles.

Viking readily acknowledges that the superior safety record of triples is related to the controlled environment in which they operate. We do not suggest their use in anything but such an environment where states' maintain strict standards for driver training, equipment specifications and highway-related control measures.

Q. Do these longer combination vehicles ever operate off an Interstate or major turnpike type highway? Would you ever operate LCV's on local city streets?

A. Triple trailers operate under strict permit controls. These controls generally limit their operation to Interstate highways or other major highways built to Interstate standards and which have traffic and engineering characteristics suitable for the equipment. In certain controlled access circumstances, the vehicles are permitted to travel off the Interstates for coupling or decoupling or approved terminal access.

It has never been the intent of Viking Freight, nor to our knowledge, that of the trucking industry to seek approval to operate triple trailer combinations in central urban areas or on local city streets which local or state highway officials had determined could not safely accommodate the vehicle.

It should be understood that triple trailers provide a means to safely and efficiently move freight over the road in terminal to terminal service. Consequently, there is no intent to operate the equipment in other than over-the-road operations.

Q. Do you believe an increased use of LCV's would result in a reduction in overall truck traffic? If so, would there be a reduction in fatal truck accidents overall due to the decrease in vehicle miles travelled?

A. Although Viking has not done any internal research on this question, we have seen outside data which strongly suggests a linkage between increased use of LCV's and a reduction in overall truck traffic.

For example, one motor carrier with an extensive history of triples operations found that three sets of triples carry as much freight as six 45-foot semitrailers. In its recently released report on the productivity and consumer benefits of LCV's, the Trucking Research Institute reported that total vehicle miles travelled - a major factor in projecting safety impacts - would decrease by 6.1 billion under a limited national network of LCV operations. Triple trailers alone would account for a 4.5 billion reduction. These figures are based upon the substitution of LCV's for conventional equipment.

With respect to the second question, again Viking has not undertaken any internal analysis. However, it is generally held that a reduction in accidents would result from a reduction in vehicle miles travelled. In its recently released report entitled, "Truck Weight Limits," the Transportation Research Board (TRB) found that truck weight policy changes that increased the number of vehicles required to carry the same payload would increase accidents and adversely affect traffic operations. According to TRB, "(c)hanges in truck weight regulations can affect highway safety and traffic congestion by (i)ncreasing or decreasing the amount of truck traffic, which in turn affects the number of accidents and highway congestion . . . "

It should be recognized that any projections on the volume of truck traffic impacted by greater use of LCV's must take into account assumptions about the nation's future economic performance. In short, there is every reason to believe the utilization of triple trailers in controlled and limited operations should lead to fewer truck trips and fewer accidents.

Q. In your opinion, how credible are most of the various existing studies regarding safety of longer combination vehicles? Is there a need for a broad-based study of the issue by a respected and non-biased research organization?

A. The question of how credible are the various existing studies on LCV safety really comes down to this: the often cited Cal Trans study was conducted under poor conditions with no controls present. Other, more scientific studies such as the one conducted by the Western Highway Institute, combined with real world experience

clearly demonstrate the feasibility of LCV's.

The general criticism of using real world operating results runs along the following lines: triples operate with the best equipment, with the most experienced drivers, over the highest quality roads in a controlled environment. Can we trust this skewed - albeit positive - operating safety data for application to all roads at all times?

The answer, of course, is we can't. But that is not what the trucking industry has sought. Triple trailers only operate under a state-controlled permit system. Studies which purport to evaluate triple trailer safety in anything other than a controlled environment are essentially putting a square peg in a round hole.

An example might help to explain. Can a large 747 jumbo jet safely land at a small rural airport? Probably not. Because of that, would anyone seriously argue that the 747 is less safe than a piper cub? Certainly not. This simply means that the equipment - either a 747 or a triple trailer - can be operated most safely in its normal, controlled environment.

All available accident statistics from states which currently permit triple trailers indicate they have been operating as safely as, if not more safely than, conventional equipment. Independent studies and individual motor carrier data overwhelmingly confirm this fact.

The New Mexico State Highway and Transportation Department conducted a state by state review of triple trailer operations. This a sampling of responses contained in their report.

South Dakota: "South Dakota's experience with the safety of the triple trailers in the first 21 months of the program is impressive."

Colorado: "There is not a single accident on record as having involved triple trailers."

Idaho: "Idaho has experienced a reduction in accidents through use of triple trailers."

Montana: "There has not been one public complaint about the triple trailers."

Utah: "What is interesting is the relative safety, under regulation, of triple trailer combinations."

The issue of LCV study credibility undoubtedly is raised because of two specific analyses: the Stein & Jones study (Washington) done for the Insurance Institute for Highway Safety and the so-called Cal Trans study. I would like to address both.

The Stein & Jones analysis has generated a great deal of interest for essentially two reasons. First, the study found that doubles had an accident involvement rate 2.5 to 3.0 times greater than tractor-semitrailers, a finding that is singularly unique among doubles research and totally contrary to individual motor carrier data. Second, the study employed a methodology that attempted to isolate all factors except the vehicle and the road: matched point for point case control.

With respect to the accident involvement rate, TRB reviewed the actual traffic count data from Washington DOT. These traffic counts showed that the exposure estimates of Stein & Jones were greatly in error, having undercounted the number of doubles in the traffic stream, "thereby inflating the involvement rates of doubles relative to tractor-semitrailers." When the exposure is corrected for the DOT counts, the "overinvolvement" of doubles disappears.

With respect to the methodology, there are problems here as well. The study selected a crash site and then analyzed the number of vehicles (singles versus doubles) that travelled past the crash site. From a statistical point of view, the selection of a crash site as the point of analysis immediately brings into question the randomness of the selection process.

The under/over count of the truck population and the method of site selection raise serious doubts about the findings of the Stein & Jones analysis.

Viking Freight is in a unique position to comment on the shortcomings of the Cal Trans study: our driver and our equipment were used for the triples demonstration. We think there were serious problems with the methodology employed in the Cal Trans analysis and certainly disagree with the portrayal of triples operating characteristics in the edited Cal Trans tape currently making the rounds.

Our driver and the triples unit were accompanied almost full time by the project manager's vehicle, a police escort, film crew (forward and rear), Cal Trans vehicles, media vehicles and a low-flying helicopter.

Most of the directions given to our driver came from the director of the film crew except where Viking officials intervened for the sake of safety. This in no way could be considered a "normal" - let alone controlled - operating environment. The "sway" of the third trailer as shown in the tape may be due to the driver's concern about film vehicles following too closely. An extraordinary amount of his attention was diverted to his rear view mirrors causing frequent correction. Such sway is certainly not the norm in other triples operations where the vehicle and driver are not subject to the distraction of a convoy of observation vehicles.

If the Committee is seriously concerned about this issue, we would welcome and encourage filming by "a respected and non-biased research organization" of actual triple trailer operations in a normal operating environment.

Once again, as the carrier involved in the Cal Trans tape, we do not believe it is an accurate portrayal of triples operations.

Finally, any studies (current or future) on LCV safety must account for exposure levels (i.e., vehicle miles travelled). This in our opinion is the only valid method to developing statistics on accident involvement rates. Studies which do not take this key factor into account will result in an "apples versus oranges" problem.

Mr. MINETA. I would now like to call forth Mr. Chuck Mack, the President of Teamster's Joint Counsel Number 7, of the San Francisco Bay area.

Mr. Mack, your statements will be made a part of the record, and you may proceed in your own fashion. It is good to see you. The last time, we had dinner at the Freemont Hotel, and you were honored by the Labor Counsel. It is good to see you.

TESTIMONY OF CHUCK MACK, PRESIDENT OF TEAMSTER'S JOINT COUNSEL NUMBER 7, SAN FRANCISCO BAY AREA

Mr. MACK. Thank you very much, Mr. Chairman—I should say "chairmen." And let me express our appreciation on the opportunity to appear before your committee to outline some of our views on this omnibus highway legislation.

We would also like to commend the chair on their good sense in having these hearings in different parts of the country, especially here in the bay area. It makes it convenient for us to participate.

The concerns that we have are pretty well outlined in the testimony. I am representing the International Union. The testimony, I think, spells out a multitude of concerns that we have. And I would like to emphasize some of those concerns, Mr. Chairman.

First of all, size and weights of the vehicles. In 1982, when the Surface Transportation Assistance Act was passed, the Congress constructed a very careful balance between different interests and reached an agreement to generally increase the size, weights, and lengths of vehicles.

The Teamster's Union supported that legislation, looking for some uniformity in standards across the country. We feel, however, that enough is enough. At the risk of joining the railroads, Southern Pacific, who we have a number of problems with; Southern Pacific, I guess, cannot always be wrong, however.

We would like to urge the committee to not include in the legislation any provisions that would allow triples, Rocky Mountain doubles, twin 40's, to be operating on the highways in the country, and, or, the highways in California. We are not asking the Congress to rollback legislation that individual states may have adopted that would permit the operation of those vehicles; but we do not believe that they should be extended.

To put on the highways of California, with the congestion we have, the number of vehicles, and the traffic patterns; combination vehicles could run 105 feet, or more, in length; we think would be irresponsible in light of the truck safety problems and the congestion that we are confronted with.

The industry record on safety, especially in the non- union sector, we view as the considerable problem. And there is just no justification, at this time, for any increase in the size of vehicles. I am sure the committee is aware, but information that we have, show, one, that less money is being spent on truck maintenance. Equipment, generally speaking, is getting older. More and more vehicles are being taken out of service, and more, and more, legislation has been passed at both the state level and the congressional level that regulates driver behavior.

Ironically enough, as we have moved away from a deregulation in the economic, or rate side; we move toward additional regulation in driver safety. And the congress has passed, I think, it is four or five pieces of major legislation in the past 10 years to deal with the safety effects of deregulation.

And statistically, as you pointed out, Mr. Chairman, the information would indicate, in some cases, that fatal accidents are down. On the other side, we can point to evidence that shows accidents are up. And you are going to get that conflicting statistic. We think that the congress and the legislation that has been passed, is a pretty good barometer of what public attitude is and what people in the public perceive as happening on the highways.

Longer Combination Vehicles, at this time, would be unwarranted. We think they would be detrimental to safety interests. In forming the conclusion, with regards to safety, we spend and rely—we rely, considerably on the opinions of our members who are operating those vehicles on the nation's highways.

As you know, in Arizona, Nevada, and Oregon, they allow triple trailer operations. So we have drivers from our own locals that operate those vehicles when they go into adjacent states. And they report back that the vehicles are more unsafe than doubles, and, especially, more unsafe than single trailer vehicles.

We also want to express our opposition to any further deregulation of the trucking industry. In the past decade, bankruptcies in trucking have increased by approximately 300 percent. We have seen significant job loss, especially in the union job sector, as nonunion companies have moved in and gained more, and more, market share. We have seen an increasing safety problem that we made reference to just a moment ago. And, ironically enough, less competition if you want to look at numbers.

Market share, especially in the LTL trucking sector, is becoming more and more a situation where three or four companies can have a control over that market share. We do not believe that additional deregulation at the federal level is warranted. We do not believe that the legislation should contain any involvement in interstate truck regulation. We think that should be left to the states.

It would appear, at least from our perspective, that the only beneficiaries to deregulation over the past 10 years, have been large shippers. Big business.

A recent study of Brookings Institution, who we also have found in disagreement with more than agreement; reached at least a couple of conclusions that we agree with. Deregulation has meant a redistribution of income. And it has taken it from LTL trucking companies in particular, and the labor force within the industry. And the redistribution has gone to large shippers.

Now, Brookings concluded through some mathematical formula, that these large shippers are passing those savings along to consumers. And we dispute that. We have not seen one shred of evidence. I am talking about tangible, empirical evidence to indicate that the public and consumers have benefited by any rate reductions that trucking companies have extended to large shippers.

In terms of tax increases, and the taxation—continued taxation within the industry; we would assume that there is going to be, obviously, continued taxation. We would urge some caution in in-

creases in that taxation, at least the Congress needs to take into consideration, the economic health of the trucking industry in making those decisions. The industry has been, for the most part, besieged by deregulation, and to now add additional tax burdens if those are—or if it is not capable to pass those along, is going to significantly impede the industry's ability to compete with other methods and other modes of transportation. And, possibly, put them at a competitive disadvantage.

Shipper responsibility. And, Mr. Chairman, you made mention of this just a few moments ago with regards to containers and overloaded containers, or overloaded intermodal vehicles. A couple of years ago, the California Teamster's Public Affairs Counsel, at the urging of Teamster's Local 70, the local union that I am fortunate enough to represent; asked that legislation be introduced into the assembly that would fix the responsibility, or at least it would get to the question of, were there, in fact, overloaded containers, and overloaded pigs, piggyback trailers, that are moving in interstate transportation.

And so we ask that all trailers, all containers, in rail yards and, also, in shipping terminals be weighed on their way out. And, also, be weighed on their way in. Now you can imagine there was a jurisdictional question with regards to this issue. All of the modes of transportation immediately said this belongs to the congress of the United States, and the state legislature should have nothing to do with it. And if you are worried about that, you will be happy to know the legislation did not pass.

On the other side of it though, we got to that issue of who is responsible and there was a lot of finger pointing. The railroads took the position it was the shipper. The shipper took the position it was the railroads. Shipping lines took the position it was the truck drivers that came in to pick up the containers, and as a result of the finger pointing and the jurisdictional questions that were raised, legislation was not passed out of the California legislature.

And, we, to some degree—some progress has been made in this area; but to some degree we are still wrestling with that question. We believe that shippers, in particular, have a responsibility when it comes to overloads. If they are loading a container, or they are loading a piggyback trailer, they are the ones that are putting the freight on. They are the ones that then have the responsibility to pick it up or have the responsibility to have it weighed. A driver who comes in to pick up that container, does not have scales available and accessible.

In some cases that is not true; some cases it is true. But where our drivers have asked shipping or asked railroads to scale containers or pigs, the railroads and container operations have refused to allow the scaling. Generally because it is acknowledged that the overloads are there. This is an area of horror stories where people are paid off to haul overloads and to scale them, to avoid scales. That situation needs to be dealt with. We think that the shipper has a responsibility in that area.

Then, Mr. Chairman, it concludes my remarks to supplement the testimony that we have offered the committee.

Thank you, very much.

[The prepared statement of Mr. Mack appears on p. 2600.]

Mr. MINETA. Thank you very much, Mr. Mack.

Chairman Anderson?

Mr. ANDERSON. Thank you, Mr. Chairman.

Mr. Mack, in your testimony you mentioned your concerns. You think of your concerns with the unacceptable level of enforcement in the trucking industry.

Are the Teamsters in support of additional programs, or expansion of existing programs, such as Mixcef, or enforcement authority by the state and federal governments?

Mr. MACK. Mr. Anderson, we have been strongly in support of the legislation that has gone through both the Congress, and, in California, state legislature; that would provide for additional enforcement. The biggest problem that we see and that impacts the public in this state and across the country, has been the movement away from union carriers and to non-union competition.

Our contracts provide language where drivers have the opportunity to refuse to operate the vehicles that are unsafe. They also can refuse to pull overloads and they cannot be suspended or disciplined in any way for that. On the other side of the industry, the nonunion segment, where there is not that contractual projection, if there is no legal protection, there is no protection.

And even with legal protection, there are numerous loopholes because while a driver may legally be able to refuse to operate an unsafe vehicle and have legal protection, there are many other reasons that that person can be disciplined some time in the future. And so people feel very vulnerable and very exposed.

We are in favor of enforcement. We add one caveat to that, and that goes with regards to random drug testing. We are not in support of random drug testing. I think as you know, Mr. Anderson, the Teamsters Union has pioneered in drug testing. We had drug testing in our collective bargaining agreements prior to the legislation being enacted by the Congress. But we are very adamantly opposed to random drug testing and we think the experience with our members and the experience so far in testing does not warrant the invasion of what we believe the constitutional rights of our members to be for a problem that exists to the limited extent that it appears to exist.

Mr. MINETA. Mr. Mack, you know you have here, again, the IBP calls for the inclusion of shippers in the overall responsibility.

I just wonder how we do that. The shipper, as I said earlier to the representative from Southern Pacific, is in Bangkok. Or if the carrier is American President Lines, or if the trucking company that takes it from the port to some railhead? Or is it the consignee in Detroit, Michigan? Who do we really throttle on this issue of weight in the container?

There was also the other suggestion that maybe we have to change the law that says that people do not rent these containers by the unit, they rent them by the weight that is in them. Maybe that is a way around it. So far it is very elusive for us and we do not have to have a study to show that probably the vast majority of the export containers, I guess, export as well as import containers are overweight.

How do we get a handle on that?

Mr. MACK. It is a difficult problem. We tried to, in some ways, avoid this question of the finger pointing. And the weighing—now this would have to be concerned more with imports than exports. But in the weighing, if every container in is weighed—and I am told by our drivers, and I am told also by others in the Long Shore Union on the waterfront, that they can pretty well tell what the weights are when they come in.

But if it would not be readily apparent of what the weight was, what was overloading; if it weighed on the way in and it is overloaded could it not be released. Then that turns back to the creativity and ingenuity of the shipping companies, the shippers, and those that have the freight to determine who is going to be responsible for reworking in essence the load. Because that is what would have to be done.

You would have to break the load at the waterfront before you let it on the street, whether it be the highway or it be streets taking it down to the railroad yard for discharge to trains to move across country.

We felt that it should not get out. It should not be allowed out of the yard, and let the shipping company and the shipper argue about who has got that responsibility. At that point, the driver and the trucking company are not yet involved in that process so you do not have to worry about their finger pointing at anybody else. And that is something that would have to, of course, be worked out in charges. If somebody overloads, it comes into the country, there is going to be a cost to work that container and that cost has got to be passed along. I would say if the shipper overloads, to the shipper.

In this country, pretty easy to fix. If the shipper overloads it, and it is tagged, or it is an overload, that shipper should have the responsibility and you do not have that problem of going out for some foreign business, you have got somebody in this country that you can go after.

Mr. MINETA. I was given a note that export containers actually weigh more than import containers coming into the country.

Mr. MACK. The latest information, that study that was recently done about the overload of containers; shows that to be true and that was one of the surprising findings of the study. We had assumed, I think everybody, that we were seeing the overloads pour into this country because they were not aware of our standards. But it even looks worse than that. Our own companies in this country are absolutely overloading with knowledge. Willfully overloading.

Mr. MINETA. And evidently that is the newspapers going out of the country, paper material, not just newspapers.

The interesting point about—you do not feel LCV's with the anti-lock breaks would be even a safe move to take?

Mr. MACK. No, we do not think that at this point that they would be safe and that they are advisable.

Mr. MINETA. And just one very quick point, and that is on access. The access rule just came out about three weeks ago and, frankly, from our perspective, we have not heard that much consternation about the access rule since it has come out. And you say, in here, that we should expect to hear about this in a short while, but so

far, we have not heard that much about it. And I think that has even been a surprise to us, that we have not heard that much more about it. So maybe with your testimony we will probably start hearing some more.

Well, Chuck, or, Mr. Mack; let me thank you, again, for your testimony. You know, we deal with Tim Sculley and Dave Sweeney back in D.C., and so we are kept well informed, but I want to thank you, in person, for your leadership and what you are doing here in the San Francisco Bay Council.

Mr. MACK. Thank you, Mr. Chairman.

Mr. MINETA. Thank you, very, very much.

Mr. MACK. Thank you, Mr. Anderson.

Mr. MINETA. Now I would like to call forward Mr. Steve Nieman, Vice President of Strategic Marketing and Planning, American President Lines. Mr. Nieman, your statement will be made a part of the record and—relax and go ahead and proceed in your own fashion.

TESTIMONY OF STEPHEN C. NIEMAN, VICE PRESIDENT OF STRATEGIC MARKETING AND PLANNING, AMERICAN PRESIDENT LINES

Mr. NIEMAN. Thank you, Mr. Chairman. Welcome, Chairman Anderson, and welcome Chairman Mineta, we are happy to see you.

There are great advantages and responsibilities in going last. First, I need to thank Mr. House for accommodating my personal schedule in that I could not arrive until the last moment. Secondly, I will be extremely brief and open myself up to your questions.

Our statement really says, please take full cognizance of three things. Please take full cognizance of the fact that it is markets, not just carriers or modes that are at issue in any surface re-authorization.

Secondly, we are in an international world, not a national world, not a state world. International consequences have to be weighed by your committee, and have to be accounted for in this legislation.

And thirdly, it is no longer a modal specific world. It is an intermodal world, and entities such as yours with modal specific responsibilities must take on the additional responsibility for looking across your mode to the intermodal consequences of your decisions.

Let me just recap by saying that an integrated, intermodal, freight transportation system has significant advantages for the American economy and ought to be encouraged. These advantages include:

A) Identifying and utilizing the most productive features of maritime, inland water, rail, and truck modes.

B) Providing a competitive point-to-point distribution system for both domestic and international trade. That is a world-wide bench mark for efficiency.

C) Boosting U.S. industrial competitiveness in world markets by creating systems that can economically support America's increasing export and import efforts.

D) Providing environmentally acceptable transportation services that relieve highway congestion, lessen safety risks, and reduce air

pollution by using the most appropriate and efficient modes in places and to the extent that they are advantageous.

E) Reducing the burdens on U.S. bridge structures and highway pavements by utilizing rail transportation for the majority of the miles.

And, finally, solving large scale transportation challenges through private industry solutions.

So in the interest of brevity, the late hour, and my responsibility as your last witness, I will conclude at that point.

I would just like to add the personal note that I have spent my working career in the transportation industry specifically the trucking and rail industry. I put my first load in the intermodal system in 1963; and put my first load on the highway in 1958.

I think that the company I represent today and our interest and our position as an intermodal transportation company represents some of the best balance in the industry in terms of what can be competitive in the market place; what is appropriate from an international policy standpoint; and what is necessary from the standpoint of looking across the advantages and the liabilities of individual modes.

Thank you. Any questions?

[The prepared statement of Mr. Nieman appears on p. 2606.]

Mr. MINETA. Thank you, very much, Mr. Nieman.

Chairman Anderson?

Mr. ANDERSON. Thank you, Mr. Chairman.

How could I not ask him a question when he has so much in my district down there. I have the APL, and Long Beach, and L.A. ports.

What specific recommendations do you have for structuring the federal surface transportation program to promote intermodalism?

Mr. NIEMAN. Two or three. And you will see it embodied in the statement that we have here, but the first one is, the cognizance, the recognition, the outward statement that we are trying to encourage a competitive international transportation system. We do not think that is recognized today. That is a very general statement, but it is a starting point.

The second thing is recognition of the fact that each movement has its unique economic characteristics, and to violate that balance by changing it in the course of this legislation is a high risk proposition. We put approximately 700,000 loads a year into the U.S. rail system. Each of those loads has a prior and a subsequent move by highway. It is not our goal to take those 700,000 loads and take them off the rail system and put them onto the highway. But we fear that some tilting of the economics in the legislation that is pending may cause that to occur.

To the contrary, we think that there is great advantage to the economy, great advantage to safety and pollution considerations by encouraging long haul loads that are presently on the highway into an intermodal system through competitive, free enterprise activity.

Mr. ANDERSON. We received testimony in Long Beach, and some of your people are involved; about the Alameda Corridor Project. Now what specific project are needed in the Bay area to ensure adequate access of truck and rail transportation to port facilities?

Mr. NIEMAN. Well, specifically in the Bay Area, the Port of Oakland is the one that, in our judgment, needs the help. The most obvious situation in fact, frankly, is a little bit different but I think you are familiar with it; and that is the need for dredging the harbor to a depth that is suitable for accommodating the new generation vessels. Today, we depart light, and that is not competitive.

Mr. ANDERSON. But what is the depth of the harbor there?

Mr. NIEMAN. Now you are going to get more technical. But, currently, it is approximately 32 to 36 feet. There is a proposal to get it to 38 feet and I believe there is a need to get it to 48 feet. I may be off by a few here, but you get the gist of the problem.

Mr. ANDERSON. I want to tell you one way you can do that.

Mr. NIEMAN. Please.

Mr. ANDERSON. When I was elected to Congress, the Port of Los Angeles had 15 feet. I was so shocked with it, and they talked to me, I went and I got it deepened, it is a little over 50 feet now. But the thing that is good about it, it is called the Glenn Anderson Deep Ship Channel. There have been two channels in the country named after Congressmen, Sam Houston, in Houston, Texas, and Glenn Anderson, Los Angeles. A third one, Mineta Channel, or something——

[Laughter.]

Mr. NIEMAN. Have no fear, I will pass it on, I see the point.

Mr. ANDERSON. And about my last question, do you have—do you acknowledge that we have an overweight container problem, and, if so, how best can we address it?

Mr. NIEMAN. We absolutely acknowledge it. Despite some people who are somewhat critical of the so-called Journal of Commerce PIERS survey that I know you are familiar with; our practical experience is, yes, there is a problem. We think it can be addressed in a number of ways.

First of all, it has to be carved down into manageable pieces. The export situation is materially different than the import situation. This has been alluded to in the flavor of your questions here this afternoon and other people's responses.

Secondly, we believe a consensus is forming, and we believe we saw it in some of the testimony before your oversight committee, last week I believe it was; that the shipper ultimately has to be held accountable for it because it is a matter of competitiveness among ports, modes, truckers, carriers of any mode. And that has to be neutralized.

The ability to control the shipper is significantly better on the export than it is on the import as is inferred. On the import situation, we believe that there is an opportunity to peruse our records to determine habitual offenders and, thus, not impede the activity at our port terminal but, rather, be able to through targeted efforts go back to those offenders on an import basis by virtue of the information we could supply.

Mr. ANDERSON. Thank you, Mr. Nieman.

Mr. MINETA. Mr. Nieman, let me ask, do you operate your own stack train?

Mr. NIEMAN. Our answer to that would be yes. But let's be real certain that we say that correctly. We own and manage the cars and the containers that go into the U.S. Rail system. We purchase

from those railroads the locomotive power and the crew that mans those trains. And, very often, for flexibility and economic reasons, we encourage and, in fact, allow our units to be mixed with the units of other intermodal operators so as to get maximum rail efficiency. So when you say do we operate our own stack trains, our PR might give you that impression, but we need to be much more precise as we talk about it.

Mr. MINETA. If I am another intermodal carrier, I got containers to ship to somewhere, do I talk to APL, or do I talk to Southern Pacific?

Mr. NIEMAN. You have your choice of talking to either. We do that presently for up to eight other steamship lines, and the Southern Pacific will also talk to you about offering that service and then when your cargo or your container physically moves, it is elective with the underlying railroad, SP or otherwise to combine your container with our containers and cars to make up a train.

Mr. MINETA. Well, in the case of southern California, where, let's say, Santa Fe's railhead is 12 miles, 17 miles, away from the port. Who is moving the traffic from the port to the railhead where the stack train is put together?

Mr. NIEMAN. It depends on the nature of the underlying commerce. I think you are referring to the general situation of import or export commerce coming through the port and going immediately to the railhead, so called international-intermodal business, where it is land-bridge business from Bangkok to Boston. The party responsible for that piece of the transaction is one of two parties.

First, most intermodal operators, most steamship lines, hold themselves out to provide that as part of their underlying service in a through move Bangkok to Boston. But many shippers elect, for whatever other reasons, and there are many good reasons; to unbundle that transaction into two separate transactions. The transaction for the steamship line ending when the container is grounded at the port, and beginning, for a second transportation company, from the port across the highway to the railhead and, hence, on to Boston. In this situation, international commerce, it could be either of two parties responsible.

On domestic commerce, going to or from that port, it is usually an operating convenience for the intermodal carrier because he is trying to reposition his international box back from that port facility.

Mr. MINETA. And once that train gets to, let's say, Boston, but the shipment or container is going to go to 123 Main Street, who——

Mr. NIEMAN. Same situation. It could be either of two generic parties. Either the underlying long haul Bangkok to Boston carrier, who is holding himself out to supply the all in bundled service to the shipper or the receiver; or, secondly it could be another party that has been requested by the shipper because the shipper has elected to un-bundle the transaction and that other party could be the party that is responsible from, say, Los Angeles to Boston.

Or, in fact, there is even a third circumstances, sort of a subset of the second circumstance. That it is conceivable in the last leg from the rail ramp in Boston to 123 Main Street could be by yet a otherwise unaffiliated cartage company that has been retained by

that shipper or that shipper's agent. So there are many parties that could be responsible for that last piece.

Mr. MINETA. As I understand that Schneider Trucking, Mr. Jones—do you know—or, Mr. Lynch? Schneider, and then what is the other outfit out of Arkansas? J.B. Hunt.

When they contract, do they contract with an APL, or with the railroad to do that segment?

Mr. NIEMAN. Well, I do not mean to be humorous about it, but neither J.B. Hunt, nor Schneider National cares to do business with us for their own proprietary reasons. So you have got two bad examples.

Mr. MINETA. Oh, okay.

Mr. NIEMAN. But in the spirit of your question——

Mr. MINETA. Well, I thought when I was at one of the meetings, they were using both Hunt and Schneider as an example of that intermodal operation.

Mr. NIEMAN. Yes. And really there are two cases, the long haul irregular route truck load carrier, such as Hunt and Schneider, as generalization do not use the intermodal system except for their relatively new joint effort between Santa Fe and Hunt, called Quantum. Schneider has tended not to use the intermodal system for their own proprietary reasons. When carriers such as those do elect to tender a trailer to an intermodal carrier, they almost invariably do that directly with that intermodal carrier, be it us, or the Union Pacific, or Conrail, or whoever it is. And that is because that is the way we have set up our marketing to those enterprises. It is strictly a elective situation with the intermodal carriers as to how they care to solicit that business.

The second situation you might be alluding to (and let me elaborate because I think it will help) is when the LTL motor-carrier, such as CF, or Roadway, or Viking tender a load into the intermodal system. This is a much more prevalent practice amongst LTL carriers than it is amongst truckload carriers. Those LTL carriers, again, come into the system through whatever is the marketing channel we hold out to them. And as a generalization, either it is a direct marketing effort or through a third party shipper agent. It is elective with the LTL carriers how he accesses the intermodal capacity.

Mr. MINETA. In any of those scenarios, do you see a need for LCV's, or what we have heard about today, the triples and the double 48's?

Mr. NIEMAN. In those scenarios, no. The question of productivity of LCV's comes up in a different context. There are selected corridors of operation in the country where we do not presently use rail underlying transportation because it is not economic to us.

The possibility of using LCV's in those corridors does exist. We do not happen to do it today. In situations where we presently use the rail mode, diversion to LCV is not our goal and not our interest. They may have some productivity aspects to them that are attractive to us, but basically we feel that on today's economics it is advantageous to use the double stacked stack train system for long lengths of haul.

Mr. MINETA. And if we do not go to longer combination vehicles, should we be lifting the 80,000 comb limitation?

Mr. NIEMAN. In our judgment there is some merit in lifting the 80,000 pound rule for two reasons.

The first one is very selfish. As I am sure you are aware, the light weight of a container plus a chassis is just inherently higher than the light weight of a highway trailer. So, from a shipper's perspective, he cannot load as much into a chassis and container as he can into a highway trailer. It is difficult for him to have the same shipment, allotment, or shipment size when the mode has a tare weight characteristic.

The second reason you might consider lifting that weight limit is because of an entirely different characteristic. And that is, there are a number of commodities in the United States that are disadvantaged at the margin at the 80,000 level. A number of shippers who manufacture very specific commodities who would be advantaged if there were some way to raise that 80,000 pound level to maximize the loading characteristics of either a highway trailer or a container chassis equipment.

Mr. MINETA. All right. I have no further questions, council, if not, Steve, let me thank you—for being with us and let me just ask one very quick question, and that is, what is the status of your new construction up in Oakland? Is that——

Mr. NIEMAN. It is on schedule, thank you. We expect to occupy it beginning the 15th of November.

Mr. MINETA. Was it affected by the earthquake at all?

Mr. NIEMAN. Well, the engineer tells us that it proved the efficacy of his design and that he was delighted for the earthquake in order to show that we have a safe building. And the answer to your question is only by about three or four days.

Mr. MINETA. Great. Thank you, very, very much, Mr. Nieman.

Mr. NIEMAN. Thanks.

Mr. MINETA. There being no further business before the committee, we stand adjourned. I would like to thank everybody for your patience.

[Whereupon, at 5:45 p.m., the subcommittee was adjourned.]

PREPARED STATEMENTS OF WITNESSES

TESTIMONY

OF

COUNCILMEMBER JIM BEALL, CITY OF SAN JOSE
CHAIR, TRANSPORTATION AND PUBLIC WORKS COMMITTEE
OF THE LEAGUE OF CALIFORNIA CITIES

VICE CHAIR, TRANSPORTATION AND COMMUNICATIONS COMMITTEE
OF THE NATIONAL LEAGUE OF CITIES

HOUSE PUBLIC WORKS COMMITTEE
SUBCOMMITTEE ON SURFACE TRANSPORTATION

CONGRESSMAN NORM MINETA, CHAIR

FIELD HEARING, SAN JOSE, CALIFORNIA
JULY 5, 1990

801 North First Street, Room 600
San Jose, CA 95110
408/277-5275

GOOD MORNING MR. CHAIRMAN AND MEMBERS OF THE COMMITTEE. WELCOME TO SAN JOSE. I FIRST WANT TO COMMEND THE CHAIRMAN FOR SCHEDULING THIS HEARING EXPLORING THE CURRENT STATE OF TRANSPORTATION SERVICES IN NORTHERN CALIFORNIA. I AM PLEASED TO HAVE THE OPPORTUNITY TO SPEAK TO YOU TODAY REPRESENTING NOT ONLY SAN JOSE, BUT ALSO THE LEAGUE OF CALIFORNIA CITIES WHERE I CURRENTLY HOLD THE CHAIRMANSHIP OF THE LEAGUE'S COMMITTEE ON TRANSPORTATION AND PUBLIC WORKS, AND THE NATIONAL LEAGUE OF CITIES TRANSPORTATION AND COMMUNICATIONS COMMITTEE, OF WHICH I AM VICE CHAIR.

I SPEAK TO YOU THIS MORNING WITH GREAT OPTIMISM. ON JUNE 5, THE VOTERS OF CALIFORNIA MADE MANY OF US WITH A KEEN INTEREST IN THE FUTURE OF TRANSPORTATION VERY HAPPY. AS YOU KNOW, THE VOTERS APPROVED PROPOSITIONS 111 AND 108 WHICH INCLUDE: 1) AN ALL-IMPORTANT INCREASE OF 9 CENTS IN THE STATE'S GASOLINE TAX FOR TRANSPORTATION PURPOSES; AND 2) $1 BILLION IN STATE GENERAL OBLIGATION BONDS FOR TRANSIT AND RAIL PROJECTS - THE FIRST OF THREE SCHEDULED BOND MEASURES FOR THIS PURPOSE. ADDING TO OUR HAPPINESS, ANOTHER BALLOT MEASURE QUALIFIED THROUGH THE INITIATIVE PROCESS AND WAS PASSED BY THE VOTERS, COMMITTING ANOTHER $1.99 BILLION PRIMARILY FOR RAIL PROJECTS. THIS IS A GREAT FIRST STEP TO TACKLE SOME OF THE TREMENDOUS TRANSPORTATION PROBLEMS WE FACE IN CALIFORNIA TODAY.

TO FURTHER SKETCH IN THE TRANSPORTATION PICTURE FOR NORTHERN CALIFORNIA, MANY LOCAL GOVERNMENTS HAVE TAKEN IMPORTANT STEPS IN

RECENT YEARS TO PASS, WITH VOTER APPROVAL, INCREASES IN LOCAL SALES TAXES WITH THE REVENUES DEDICATED TO KEY TRANSPORTATION NEEDS. SANTA CLARA COUNTY, WHERE YOU ARE TODAY, HAS PASSED SUCH A MEASURE TO IMPROVE THREE KEY CORRIDORS IN OUR COUNTY. SINCE THE PASSAGE OF THE SANTA CLARA COUNTY SALES TAX, MANY OTHER BAY AREA COUNTIES AS WELL AS SACRAMENTO HAVE FOLLOWED WITH SIMILAR MEASURES. MANY OTHER NORTHERN CALIFORNIA COUNTIES ARE PLANNING ON SIMILAR BALLOT MEASURES.

IN ADDITION TO THE ABOVE EFFORTS, AN IMPORTANT COMPONENT OF TRANSPORTATION FINANCE THAT IS OFTEN FORGOTTEN IS THE EFFORT OF LOCAL GOVERNMENTS CONTRIBUTING LOCAL DISCRETIONARY FUNDS TO TRANSPORTATION PROJECTS. OUT OF THE TOTAL AMOUNT OF CITY EXPENDITURES ON TRANSPORTATION, SOMEWHERE BETWEEN 40 AND 50 PERCENT COMES FROM LOCALLY RAISED "DISCRETIONARY" FUNDS. THIS DEMONSTRATES A REAL COMMITMENT TO TRANSPORTATION, ESPECIALLY IN LIGHT OF THE STATE'S IMPOSSIBLE TAX STRUCTURE AND THE LACK OF AUTHORITY OF LOCAL GOVERNMENTS SINCE PROPOSITION 13.

IN SPITE OF OUR OPTIMISM AFTER JUNE 5, STUDENTS OF TRANSPORTATION FINANCE IN CALIFORNIA REALIZE THAT THE RESOURCES IN THE FORESEEABLE FUTURE WILL NOT BE ENOUGH TO PROVIDE AN ACCEPTABLE LEVEL OF TRANSPORTATION SERVICE IN THIS STATE AND NORTHERN CALIFORNIA. IN ORDER TO MAKE THE SCARCE RESOURCES GO FURTHER, WE HAVE TO EXERCISE BETTER JUDGMENT ABOUT OUR TRANSPORTATION FACILITIES. THIS IS ESPECIALLY TRUE IN OUR CONGESTED URBAN AREAS. THE VARIOUS LEVELS OF GOVERNMENT WHICH

SHAPE TRANSPORTATION POLICY CAN NO LONGER MAKE DECISIONS IN AN ISOLATED MANNER. THE FULL IMPACT OF EACH DECISION, NOT ONLY FOR THE JURISDICTION MAKING THE DECISION, BUT NEIGHBORING JURISDICTIONS MUST BE CONSIDERED.

A CORNERSTONE OF THE TRANSPORTATION PACKAGE PASSED BY THE VOTERS ON JUNE 5 WAS A REQUIREMENT THAT THE LOCAL GOVERNMENTS, COUNTIES AND CITIES, IN EACH URBAN COUNTY MUST ADOPT A CONGESTION MANAGEMENT PLAN DESIGNED TO REDUCE TRAFFIC CONGESTION AND SPECIFICALLY LINK URBAN DEVELOPMENT DECISIONS TO THE TRANSPORTATION SYSTEM. CONGESTION MANAGEMENT PLANS WHICH ARE CONSISTENT WITH REGIONAL AND STATEWIDE TRANSPORTATION PLANS WILL HAVE A COMPETITIVE ADVANTAGE FOR THE FUNDS MADE AVAILABLE BY THE JUNE 5 VOTE; AND, LOCAL AGENCIES WILL BE ABLE TO WITHHOLD LOCAL GAS TAX SUBVENTIONS TO NEIGHBORING JURISDICTIONS IF THEY DO NOT COMPLY WITH THE CONGESTION MANAGEMENT PLAN. THIS IS A COMPLETELY NEW WAY OF "DOING TRANSPORTATION BUSINESS" IN CALIFORNIA, NECESSITATED BY THE TREMENDOUS GAP BETWEEN THE STATE'S TRANSPORTATION NEEDS AND ITS RESOURCES.

IN ADDITION TO THE IMPROVED PLANNING REQUIREMENTS IN THE CONGESTION MANAGEMENT PLAN, LEADERS AT ALL LEVELS OF GOVERNMENT ARE SERIOUSLY DEBATING ALTERNATIVE GOVERNING STRUCTURES TO DEAL WITH THE UNPRECEDENTED GROWTH BEING EXPERIENCED IN CALIFORNIA. SEVERAL KEY LEGISLATIVE PROPOSALS ARE CURRENTLY UNDER CONSIDERATION IN SACRAMENTO. ADDITIONALLY, BOTH GUBERNATORIAL CANDIDATES HAVE INDICATED SUPPORT FOR ESTABLISHING NEW

INSTITUTIONS OR REARRANGING OLD INSTITUTIONS IN AN ATTEMPT TO GET A BETTER HANDLE ON URBAN DEVELOPMENT IN THIS STATE. CENTRAL TO ANY OF THESE INSTITUTIONAL CHANGES WILL BE OUR STATE AND LOCAL TRANSPORTATION SYSTEM. IN THE NEXT 10 YEARS, WE EXPECT TO SEE SIGNIFICANT CHANGE IN CALIFORNIA AS IT RELATES TO OUR TRANSPORTATION DECISION-MAKING STRUCTURE.

THE NEXT CRITICAL STEP FOR TRANSPORTATION IN CALIFORNIA IS CONGRESS' DELIBERATIONS TO DEVELOP A POST-INTERSTATE TRANSPORTATION POLICY. THE POLICY MUST FIT CLOSELY WITH THE DEVELOPMENTS I HAVE ALREADY OUTLINED HERE TODAY. THE POLICY MUST PROVIDE NEEDED REVENUE, BUT ALSO PERMIT THE FLEXIBILITY TO SPEND THE MONEY WISELY IN ACCORDANCE WITH STATE AND LOCAL TRANSPORTATION PRIORITIES. CALIFORNIA HAS TAKEN CRITICAL STEPS TO PUT ITS TRANSPORTATION PROGRAM IN ORDER. CONGRESS AND THE PRESIDENT MUST NOW ACT IN SUCH A MANNER AS TO COMPLEMENT THIS ACTION. TO ACCOMPLISH THIS GOAL, I OFFER THE FOLLOWING RECOMMENDATIONS FOR THE FEDERAL POST-INTERSTATE POLICY:

1. COMMITMENTS MUST BE MADE TO COMPLETE THE CURRENT INTERSTATE PROGRAM.
2. FUNDING LEVELS SHOULD BE SET TO PROPERLY MAINTAIN AND REHABILITATE THE EXISTING FEDERAL SYSTEM. THE POST-INTERSTATE PROGRAM PRIORITIES SHOULD BE SHIFTED TO RESOLVE THE URBAN/SUBURBAN CONGESTION PROBLEM.
3. EACH STATE MUST BE GUARANTEED A RETURN ON ITS FEDERAL TAXES IN AN AMOUNT PROPORTIONAL TO ITS CONTRIBUTION.
4. FLEXIBILITY HAS TO BE BUILT INTO THE SYSTEM TO PERMIT THE

EXPENDITURE OF THE MONEY IN ACCORDANCE WITH HIGH PRIORITY NEEDS IDENTIFIED THROUGH THE LOCAL PLANNING PROCESS, REGARDLESS OF MODE OF TRANSPORTATION OR OWNERSHIP OF THE SYSTEM, i.e., THE URBAN/SUBURBAN/RURAL SOLUTION.

5. THE CURRENT FAU/FAS PROGRAMS MUST BE MAINTAINED INITIALLY AT THE CURRENT LEVEL AND THEN INCREASED TO REFLECT INCREASED COST IN PROVIDING THE SERVICE.
6. THE TRANSPORTATION TRUST FUND SHOULD BE ESTABLISHED INDEPENDENT FROM THE GENERAL FEDERAL BUDGET AND SHOULD NOT BE INCLUDED IN THE DEFICIT CALCULATION.
7. THE FEDERAL GAS TAX SHOULD NOT BE INCREASED FOR DEFICIT REDUCTION PURPOSES.
8. THE NEW FEDERAL TRANSPORTATION POLICY SHOULD PERMIT STATE AND LOCAL GOVERNMENTS TO AMORTIZE BILLBOARDS ON FEDERAL HIGHWAYS; AND ENHANCE HIGHWAY SAFETY THROUGH IMPROVED TRUCKING REGULATION.

WE HOPE THESE REMARKS WILL BE HELPFUL IN YOUR DELIBERATIONS. AGAIN, THANK YOU FOR THIS OPPORTUNITY. THE LOCAL GOVERNMENT OFFICIALS OF NORTHERN CALIFORNIA ARE READY TO ASSIST YOU IN ANY WAY WE CAN TO DEVELOP MEANINGFUL FEDERAL TRANSPORTATION POLICY TO LEAD US IN THE NEXT CENTURY.

TESTIMONY BEFORE THE HOUSE SUBCOMMITTEE ON SURFACE TRANSPORTATION

THE HONORABLE NORMAN MINETA, CHAIRMAN

JULY 5, 1990

ROBERT K. BEST

DIRECTOR

CALIFORNIA DEPARTMENT OF TRANSPORTATION

Mr. Chairman and Members of the Subcommittee, I am pleased to be here today and want to thank you for the opportunity to speak before you.

Today, the federal government is on the verge of completing the 35-year-old interstate construction program. This event has raised important questions about the future of the national program and the sorting-out of respective federal, state, regional, and local responsibilities. The nation expectantly waits for a new and responsive program that will carry us successfully into the 21st century. We in California are pleased to be part of the refocusing of national commitment.

As you may be aware, California has, for the past two years, been working with and seeking the advice of various groups and individuals across the nation to develop a wide range of recommendations for an improved federal transportation program. We have been assisted by numerous state transportation officials,

local governmental representatives, informational groups, and the federal government. We have received advice, suggestions, and challenges from the United States Department of Transportation, members of Congress, and the staffs of the House and Senate Transportation Committees.

All have played an important part in shaping California's recommendations to Congress. Those recommendations are outlined in our report "Addressing Modern Transportation Challenges" which I would like to make part of the record.

Our report contains a wide range of proposals that we would urge the Committee to consider in developing the nation's new transportation policies. Among the more than 65 recommendations are: a call for a gradual spend-down of the multi-billion dollar federal highway trust fund, including the mass transportation account and aviation trust funds; a more focused federal role; greater state/local flexibility in spending federal transportation dollars, and increased private sector participation in solving the nation's transportation problems.

The interstate program has been one of the most successful public works efforts ever undertaken. It has been an effective system to move people and goods across our country. As we have moved toward its completion, our country has undergone profound changes and the interstate is now being asked to serve the dual role of

moving cross-country commerce and a burgeoning stream of local commuters. Indeed, the interstate system in most major urban areas now carries far more traffic than it does interregional and interstate traffic.

In many of our cities, the interstate system is being reduced to near total ineffectiveness because of our over dependence on its capacity. We must look beyond the interstate and the dated transportation paradigms it has created.

We in California are proposing a new surface transportation policy responsive to the needs of today's economy and tomorrow's opportunities. The California proposal has the following six major goals:

- Preserve the existing national infrastructure investment;

- Refocus national policies to respond to urban congestion, rural access, intermodal connections, and air quality;

- Redirect our efforts toward moving people, information, and goods rather than vehicles;

- Give priority to projects -- regardless of mode -- that offer the best solution to each region's transportation problems;

- Create new partnerships and respective responsibilities that will allow the nation to remain competitive in a global economy; and,

- Provide accountability to Congress for achieving national objectives set by Congress.

Under the California proposal, federal restrictions on how transportation funds can be spent by the states would be eased, allowing more state and local discretion in addressing specific transportation problems.

For example, we face a situation where categorical money can be spent only for specific purposes, such as widening a lane on a freeway, when extending a mass transportation system would serve more people, reduce congestion, and help improve air quality. We need to be empowered to make the solutions fit the problems.

Among the things the California proposal does not call for is an increase in the federal gasoline tax. There is sufficient money flowing into and unspent in the three transportation trust funds to meet at least our short-term -- four to five years -- needs. We believe that we can attain considerably higher efficiencies in the use of available funds if we are authorized to use them in a more responsible way.

California believes that our recommended structural changes in the overall federal, state, and local transportation partnership -- including program consolidation, financial arrangements, and federal oversight -- are critical to an efficient and responsive future transportation system regardless of the level of resources provided federally.

The opportunity to reshape our nation's transportation policies must not default to the assumptions, institutional relationships, and policies that shaped the program created nearly three-and-a-half decades ago.

Thank you.

ADDRESSING MODERN TRANSPORTATION CHALLENGES

CALIFORNIA'S RECOMMENDATIONS FOR A POST-INTERSTATE NATIONAL SURFACE TRANSPORTATION PROGRAM

JUNE 1990

ACKNOWLEDGMENT

In the preparation of this document, California has received assistance and advice from a variety of important sources from throughout the country. We have been assisted by numerous state transportation officials, local governmental representatives, informational groups and the Federal government.

We have received advice, suggestions, and challenges from the United States Department of Transportation, members of Congress, and the staffs of the House and Senate Transportation Committees.

Some contributors have drafted parts of this report; others have raised important issues that we have struggled to address; and others have provided much needed criticism. While an exhaustive list of contributors would be difficult to prepare, we would like to thank in particular:

Crescent Coalition states; the Bread Basket Coalition states; the United State Department of Transportation, in particular, Administrator Thomas Larson and Associate Administrator Steve Lockwood; Congressmen Glenn Anderson and Norm Mineta and the staffs of the Committee on Public Works and Transportation, in particular Paul Schlesinger, Kenneth House, Jack Schenendorf, Roger Slagle, and Caryll Rinehart; the staff of the Senate Environment and Public Works Committee, in particular, Nadine Hamilton, Michael Weiss, and Jean Lauver; and Taylor Bowlden, Director of Legislation for Senator Symms.

All have played an important part in shaping this document and all deserve our thanks.

Finally, a special thank you to Robert James for his help in editing this report.

Executive Summary

The Surface Transportation and Uniform Relocation Assistance Act of 1987 expires in Federal Fiscal Year (FFY) 1991. The debate triggered by the upcoming expiration of the legislation and the prospect of completing the Interstate System, presents a major generational opportunity to frame a new surface transportation policy responsive to the needs of today's economy and tomorrow's opportunities.

The rich potential of this opportunity will be irrevocably lost if the debate and policies that emerge default to the assumptions, institutional relationships, and programs that shaped the policies of three decades ago. The nation's economy, demographics, institutions, political agenda, international relations, infrastructure, and its transportation problems have fundamentally changed since the creation of the Interstate System and urban mass transportation programs.

It is within this changed environment that we must fashion the objectives and programs of a new national surface transportation program. A new program must be designed to:

- preserve our existing national infrastructure investment;
- refocus national policies to respond to urban congestion, rural access, intermodal connectivity, and air quality;
- give priority to projects (regardless of mode) that offer the best solution to each region's transportation problems.
- new partnerships and respective responsibilities that will assist the nation to remain competitive in a global economy; and,
- provide accountability to Congress for achieving national objectives.

California believes that the following recommended structural changes in the overall federal, state, and local transportation partnership — including program consolidation, financial arrangements, and federal oversight — are critical to an efficient and responsive use of whatever level of resources that may be provided.

It is the clear intent of California that the proposed structural changes should not be considered to be contingent upon expanded federal funding.

Following are California's recommendations for a new national transportation program:[1]

Program Structure

Federal Highway Program — Highway System of National Significance

- The Highway System of National Significance (HSNS) Program as authorized by Congress, would aim to preserve our nation's investment in its interstate transportation system; aid interstate commerce and national defense; and expand our domestic and international commerce and trade. The HSNS would be a state designated highway network based on Congressionally established national transportation goals and objectives.
- Each state Department of Transportation in cooperation with the United States Department of Transportation (US DOT), would designate its HSNS based on Congressionally identified criteria that reflect the national goals and objectives for the HSNS.
- Congress would set the broad goals and objectives for the HSNS. The US DOT would establish specific measures to be used by states to assess the performance of the HSNS in meeting these goals and objectives. Every two years US DOT would issue a systems performance report for review by Congress.

---

[1] *California's detailed recommendations for a new national transportation program have been developed as a package; each recommendation is interconnected with and builds upon other recommendations. Because this is a complex issue the reader is encouraged to consult the full report and appendices for a more detailed explanation of the recommendations.*

FEDERAL AID SURFACE TRANSPORTATION – HIGHWAYS

- The Federal Aid Surface Transportation – Highways (FAST-Highways) Program would relax the customary categorical program designations. (It is an extension of the Combined Road Plan Program concept created by Congress in 1987.) The FAST-Highways Program would provide a framework for states to pursue broad national goals and objectives set by Congress yet recognize the state and local focus of the FAST-Highways system and its bridges and their support of the HSNS.
- The FAST-Highways Program would allow states and local jurisdictions the flexibility to choose from a broad range of transportation solutions to respond to their unique set of transportation concerns.
- Each state in cooperation with their regional and local agencies, would be required to establish FAST-Highways Program guidelines. These guidelines provide a program framework that ensures accountability as well as the flexibility to pursue solutions which bring the most efficient increase in mobility and effectively address regional and local land use, air quality, and economic development issues.
- The FAST-Highways Program is not a block grant program but, like the HSNS, is an evolutionary step that replaces a series of largely unrelated categories with a uniting program that continues to be directed by Congressionally specified goals, objectives and outcomes.

HIGHWAY PROGRAM FUNDING

- Our goal is to provide each state with the opportunity to use its total resources (federal, state, local and other), in ways that will respond effectively to its specific circumstances and objectives.
- To advance this end, Congress should specify the split of total federal funding between the HSNS and FAST-Highways Programs to be 50% /50% and that each state be allowed to transfer up to 20 % of its total federal highway apportionment from one program to the other.
- Funding for the HSNS program should be apportioned to states by a formula using factors that are decoupled from direct ties to the designation of the national highway system itself. California recommends that total public road mileage, diesel fuel consumption and VMT be the factors used in the apportionment formula for the HSNS Program.
- Funding for the FAST-Highways Program should be apportioned to the states based on their proportionate contributions to the federal highway trust fund.
- The matching ratio for both the HSNS and FAST-Highways Programs should be 85% Federal and 15% State/Local/Other. It is critical that Congress establish the same matching ratio for both highway programs, so that an incentive to chase cheaper federal dollars at the expense of the best transportation solution will not be created.
- As it has been done historically, the new transportation act should continue to include various assurances to provide equitable funding levels for all states.

MASS TRANSPORTATION PROGRAM — PROGRAM STRUCTURE

- As a first step towards bringing the transit and highway programs together, California believes that the transit component of the national transportation program should have a structure similar to that recommended for the highway programs.
- Existing federal transit programs should be consolidated into two programs: the Transit System of National Significance (TSNS) and the Federal Aid Surface Transportation-Transit (FAST-Transit) Programs.
- The TSNS Program would be a discretionary program aimed at addressing issues of na-

tional significance. The program would be complementary to the HSNS in meeting Congressionally identified goals and objectives.

- In order for transit projects to be eligible for the TSNS program, they would have to be within a designated HSNS Corridor and meet Congressionally identified eligibility criteria.
- The FAST-Transit Program, which would work in conjunction with the FAST-Highways Program, would be a formula apportioned program aimed at pursuing national goals and objectives set by Congress.
- The FAST-Transit Program would consolidate and streamline the various existing federal transit programs into one program. Eligible project types under a consolidated program would include: capital investment needed to replace and rehabilitate current equipment and facilities; capital investment necessary to retain current market share; new starts and extensions; and transit operating support.[2]

MASS TRANSIT PROGRAM FUNDING

- The reliability and predictability of federal funding must be improved through increased reliance on formula apportionment and on dedicated funding at the federal level while still recognizing past commitments.
- On a national basis, the Mass Transit Account funds would be split 15% for the TSNS Program and 85% for the FAST-Transit Program. States should have the opportunity to permit regional agencies to shift between or combine their FAST-Highways and FAST-Transit Programs funding in accordance with an adopted Corridor Plan or Regional Transportation Plan.
- Funds for the FAST-Transit Program, would be apportioned to the states based upon their proportionate contributions to the federal Mass Transit Account.
- The matching ratios for the HSNS, FAST-Highways and FAST-Transit Programs would be set at 85 percent Federal and 15% state/local/other with an optional overmatch.

- The suggested federal contribution for the TSNS discretionary program would be in the range of 25% to 50% of the project costs which would require 75% to 50% of the project costs to be borne by those most benefitted by the project.

PRIVATIZATION

- Privatization can help bridge the widening gap between transportation infrastructure investment and funding. California believes there are several areas where the benefit of private investment can be tapped including: bridges, roadside rest areas, the HSNS program, and Intercity Rail.
- Congress should create a discretionary bridge program, that is a revolving fund and funded at a maximum level of 2 percent of the total highway allocation. As a precondition, a jurisdiction applying for funds must certify that a good faith effort was made to promote private investment and operation of the facility. Because the larger, higher volume bridges would be more attractive to private funds, the smaller, low traffic bridges could

---

[2] *In urbanized areas above 200,000 population, there should be a limit on the amount of the area's apportionment that could be used for operating assistance.*

potentially have greater access to this limited revolving fund program.

- Many states are finding it increasingly difficult to construct and maintain sufficient roadside rest areas along their major roadways. States should be authorized to permit private for profit enterprise to locate at roadside rests in return for lease income (to be used to construct additional roadside rests) and full maintenance of the rest areas' free public services.
- Retrofit toll facilities on HSNS facilities could help to ensure the preservation of the HSNS under the ever increasing demands for limited federal and state funds. Congress should authorize the states to place retrofit toll facilities on those segments of the HSNS that are beyond their design life, provided that all net revenues be used for rehabilitation, resurfacing, and restoration projects on the tolled facility.
- California recommends that Congress review and change the existing tax structure where necessary to encourage increased private investment in passenger and freight rail systems.
- Additional benefit could be realized if states were permitted access to rail corridors (under franchise or concession agreements) which may be subject to the exclusive rights of AMTRAK, when that state has an economically viable alternative to AMTRAK service in that corridor and the viability of AMTRAK's national railway network is not threatened.
- A number of significant tax related barriers at the national level discourage or limit the private sector's interest in risking capital on public infrastructure. Congress is called upon to eliminate these inhibiting statutory provisions.

SPECIAL INTEREST PROJECTS

- Special interest projects appear to be the result of two Congressionally recognized deficiencies in the existing highway program structure. Special interest projects tend to address gaps in national policy (e.g., port access) or the inability of local district projects to compete favorably with other

statewide priorities. Basic changes such as those recommended for the Highway Program Structure will ensure that these gaps in national policy do not continue to occur.

- However, when a need for a special interest project is identified, it should meet certain funding and programmatic criteria. Those are: the special interest project is a high priority within the statewide transportation program of projects; it is clearly among the highest priorities within the local jurisdictions; and the state/local agencies are willing to share in the cost of the project.

PLANNING

- At the national level, Congress must set the example for coordinated, cooperative planning and ensure that all policies and planning requirements through the various federal departments and agencies are mutually reinforcing.
- The existing federal "3C" planning process should be strengthened and employ a subregion/corridor approach.
- Congress should continue to fund multimodal planning at the state and regional level that is directed by overall strategic national policy direction. Federal planning funds should be available for use without regard to modal definition.

RESEARCH AND DEVELOPMENT

- Congress should authorize the US DOT to establish a national transportation technology research and development agenda to be coordinated by a nationally recognized blue ribbon panel, targeting promising experimental technology and supporting special interest projects which accelerate technology transfer.
- Challenge grant funding should be made available for research and development programs to be conducted by states, private consortia or educational institutions consistent with the national agenda.
- To increase participation by private consortia in the national transportation research and development agenda, changes in tax and antitrust laws will need to be explored.

AIR QUALITY

- Congress should ensure that all national transportation, air quality and energy policy is implemented through mutually reinforcing regulations and requirements. An

advisory panel of state and local transportation agencies should be formed to develop detailed recommendations for transportation related air quality program implementation.

INTERMODALISM

• The new national transportation program must shift the emphasis from single mode competitive systems to intermodal, cooperative and interdependent systems. Congress can aid this shift in emphasis by specifying that a given percentage of transit funds for highways, transit, and aviation be available at the discretion of the state and local entities for joint funding (with the private sector, where appropriate) of intermodal passenger and freight transportation facilities.

PROGRAM EFFICIENCIES

• California recognizes the essential role played by the US DOT and believes that it should remain responsible for ensuring the effective use of federal transportation resources. However, many of the controls and procedures developed under existing program regulations should be modified to reduce program and administrative costs in the new program.

TRANSPORTATION SAFETY

• The current federal highway safety programs should be consolidated into a single driver-performance grant program. This would reduce the need for separate program authorizations, minimize program application requirements and red tape, and increase program flexibility.

- National traffic safety goals and objectives would be established by the Congress. The US DOT would establish, in cooperation with states, local jurisdictions and private sector interests, performance thresholds for each state.
- Each state would be required to report to the US DOT regarding their state system's safety performance versus its performance threshold.

Federal Funding

- The Highway Trust Fund should be made permanent and obligation limits should be gradually eliminated by $1.5 billion per year.
- Decisive action is required by Congress to reduce the extent to which tax evasion is "stealing" from the Highway Trust Fund.
- Congress, in mandating the use of alternative fuels in air quality non-attainment areas, should discontinue the special fuels tax exemption or shift subsidies to the general fund.
- States experiencing rapid growth will probably find that innovative and creative financing is necessary in all aspects of their transportation improvement program. These concepts, however, should not be mandated for use by all states, but rather be available on a permissive basis.
- In order to facilitate the transition between the existing program and the new program, California recommends that Congress adopt one final cost estimate to fulfill the long standing commitment to complete the Interstate system and Interstate Substitute Projects. The necessary authorizations and distributions should be spread over the life of the next Surface Transportation Assistance Act in accordance with a state by state obligation plan coordinated through US DOT.

In summary, California's recommendations for a national transportation program address a number of diverse problems including the need for: greater program flexibility to meet differing regions' needs; a new federal, state, regional, local partnership that recognizes greater program management and resource contribution responsibilities should reside at state and local levels; a need for Congress to ensure that states are accountable for the results of program implementation; greater integration and connectivity among key transportation modal systems; and new, creative means to finance total systems needs.

We are continuing to consult with representatives of other federal, state, regional and local officials and private transportation interests in order to find common ground in the development of specific legislation to implement the policy framework.

INTRODUCTION

This report details California's recommendations for a new federal transportation program. These recommendations were developed through consultation with state, regional and local officials and private stakeholders from California and throughout the nation. We hope that they will serve as a basis for future dialogue.

Our recommendations are based in large measure on the following widely shared conclusions:

- We've become a nation of diverse metropolitan and rural regions with differing geographic, demographic and economic characteristics. Huge changes in where and how we live, go to work, and send our goods to market, require new approaches in how we manage and fund future transportation programs.
- Through the efforts of past generations, we have modern highways, transit systems and railroads that unite the nation, propel its economic progress and enhance its quality of life. These systems are now our responsibility to manage and preserve and, as necessary, to expand and unite. New systems require new programs and policy initiatives to help realize their full capabilities for present and future generations.
- Our nation must redirect its collective efforts toward moving people, information, and goods rather than moving vehicles. The new federal program must refocus national policies to respond to relieving urban congestion, improving rural access, fostering intermodalism, enhancing air quality and giving priority to projects (regardless of mode) that offer the best solutions to each region's transportation problems.

The essential element for an effective future program is a new federal, state and local partnership. One that provides greater program flexibility — with accountability to Congress for the achievement of national objectives; places greater program management and resource contribution responsibilities at state and local levels; permits use of creative means to finance total systems needs — including more opportunities for private sector investment and management.

Consistent with these points, California seeks the creation of a surface transportation act for the nineties that:

- Maximizes the effectiveness of current highway trust fund receipts by dedicating user fee revenues solely to transportation needs — keeping them exempt from non-transportation uses and available to the states at authorized levels each year;
- Postpones consideration of increases in user fees until all current and future fees are committed to their intended transportation purposes, and alternative fuel exemptions are reconsidered;
- Provides full funding for the completion of the unfinished Interstate Construction Program including substitute projects;
- Takes a comprehensive approach to highway safety;
- Defines federal program transportation responsibilities among the various levels of government;
- Encourages policies that will promote economic strength in regional markets;
- Reconciles differences between environmental and transportation policies and makes these policies mutually reinforcing.

The text that follows suggests to Congress, the type of program structure and related creative approaches — many involving all levels of government — that would implement the objectives listed above.

Program Structure

If meeting the nation's future transportation service needs required only a "business as usual" approach, the preparation of a new surface transportation act would be relatively straight forward. However, decades old policies are no longer fully effective. National and regional demographics and changing development patterns demand innovative, flexible and better coordinated programs if we are to remain a significant player in the world economy.

Legislation now governing national transportation policy must be restructured to aggressively address mobility across traditional modal lines. New programs must lead to partnerships

and more clearly drawn responsibilities. They must allow the nation to remain competitive in a global economy, while providing accountability to Congress for achieving national goals and objectives.

CHANGES TO PROGRAM STRUCTURE MUST OCCUR REGARDLESS OF THE LEVEL OF RESOURCES PROVIDED FEDERALLY.

California believes that changes which consolidate prog ams, spur innovative financial arrangements, and create strategy based federal oversight are critical to efficient and responsive future transportation systems regardless of the level of resources provided federally. Our major goal is to help fashion a national program that will be viewed, in years to come, with the same level of respect as the program now drawing to a close. California's recommendations for a post-interstate national transportation program, drawn along these lines follows.

FEDERAL HIGHWAY SYSTEM OF NATIONAL SIGNIFICANCE (HSNS) PROGRAM

The federal, state, and local governments have an inherent interest in the existence of a well maintained and integrated interstate transportation system. Broad national defense, economic, safety, and international policy goals are advanced by efficient transportation systems which ensure the free movement of people, goods, and information.

EACH STATE DESIGNATES ITS HSNS BASED ON CONGRESS'S GOALS AND OBJECTIVES.

We recommend that Congress focus national resources upon the important goals of preserving the nation's investment in its interstate systems and ensuring that these systems continue to actively support interstate commerce, the national defense and the linkage of major urban areas. Also, national investments should increasingly encourage domestic and international commerce and trade. Based on congressionally established national transportation policy and objectives, a new federal high priority highway network, a Highway System of National Significance (HSNS), should be designated from the most vital elements of the current network.

DESIGNATING THE HSNS

All currently approved and designated Interstate Highways would be incorporated into a new Federal Highway System of National Significance (HSNS). In addition, each State Department of Transportation (DOT) — in cooperation with the United States Department of Transportation (US DOT) and in consultation with regional and local governments and private sector users, — would designate other strategic portions of its respective principal arterial networks as part of the HSNS. HSNS segments would be required to meet one or more of the following defense and commerce related criteria[1]:

HSNS MILEAGE WOULD NOT BE A FACTOR IN DISTRIBUTION FORMULAS.

1. Provide major access to military installations that employ 500 or more permanent civilian or military personnel.
2. Serve as a major freight distribution route handling an Annual Average Daily Truck Traffic volume (AADTT) over 2,000 with at least one half of the truck traffic including vehicles of three or more axles; and for those additional highways where AADTT is over 5,000.
3. Provide access to international airports with a minimum of 1.5 million enplanements per year or 10,000 tons of air cargo per year or access to intermodal yards (including water ports) handling a minimum of 6000 twenty-equivalent units (TEUs)[2] per week or 1.0 million short-tons per year.
5. Connect international border crossings that service over 100,000 people crossing into the US per month.
6. Serve as the principle access to national parks, recreation areas, monuments, or historic sites with over 1,000,000 annual attendance.

After a system has been developed based on the above criteria, each state in conjunction with US DOT will exercise judgement to ensure continuity and connectivity. Each state would be able to amend its HSNS, with the approval of the Secretary, commensurate with changes in conditions and circumstances in each state. For example, the opening or relocation of an international airport may require that access roads to the airport be designated as part of the HSNS to make it eligible for HSNS funds.

The HSNS Program would be supported with a mix of federal and state funds. Eligible projects would include highway rehabilitation, resurfacing, restoration, capacity expansion and new highways meeting HSNS criteria.

The cumulative mileage of eligible HSNS projects would not be a determining factor in the

---

[1] *These criteria are for illustrative purposes and will need further refinement. A map depicting the HSNS system for California based on these criteria is included in the back cover pocket.*

[2] *TEU is an industry standard of measurement for the number of shipping containers held by a vessel.*

distribution formulas used for HSNS allocations. Instead, funds would be distributed through factors which solely correlate with the achievement of national goals and objectives. In this way the program can avoid the potential bias arising from the states' attempts to increase funding by maximizing the miles present in the HSNS program.

The HSNS funding mechanism also should allow the following variation to encourage innovative solutions to severe metropolitan congestion problems. Urbanized areas with limited opportunities for physical expansion of existing HSNS facilities, could use HSNS funds to improve supporting subsystems, where it can be shown that the HSNS routes would substantially benefit from this investment. For example, improvements to parallel systems (including transit systems) within the HSNS service corridor are likely to offer substantial direct and measurable benefits to HSNS operations.

In fact, Federal guidelines should authorize and encourage states to use HSNS funds for related improvements within a defined HSNS corridor — provided that the improvements are consistent with the metropolitan area's Regional Transportation Plan and can be shown to be more cost effective than direct expenditures on HSNS facilities.

Under other proposals including AASHTO's, existing interstate toll roads would be designated as HSNS routes. California recommends selected HSNS designated routes that are currently untolled be allowed to become toll roads and still retain eligibility for HSNS funds. Tolls collected on these select HSNS routes would be used to fund rehabilitation, resurfacing or restoration projects on the tolled facility and on non-HSNS roadways within the HSNS service corridor as described previously. Any toll revenues that are in excess of what is needed to preserve the tolled facility, should remain in that state for expenditure on other HSNS routes.

ACCOUNTABILITY

Each state would be accountable to Congress for meeting performance improvement standards tied to expenditures made on the HSNS system. For example, every two years State DOTs would be required to prepare a performance report on its HSNS system. The US DOT would review, and consolidate these reports and transmit the summary findings to Congress. Congress would then determine if its program's goals and objectives were being met and take actions as necessary to encourage performance improvement.

EACH STATE IS ACCOUNTABLE FOR THE PERFORMANCE OF THE HSNS.

• • • • •

Under this scheme, Congress, by statute, would set the broad goals and objectives for the HSNS. The US DOT would establish specific measures based on Congressional goals and objectives to be used by states to assess their performance. Each State would report on their success in improving statewide system performance in relation to its previous annual performance (e.g., previous year, two years, three years, etc.).

Appendix A contains goals, objectives, and performance measures that Congress could use to assure the effectiveness of the HSNS program.

• • • • •

RECOMMENDATIONS TO CONGRESS

1. Require that the Highway System of National Significance advance direct national interests with regards to interstate commerce, national defense, transportation and economic improvements in domestic and international markets.
2. Designate the Highway System of National Significance according to the specific criteria and mechanism set forth on page 4.
3. Use performance criteria and specific measures of the type listed in Appendix A in assessing the effectiveness of the Federal HSNS program.

38-253 O—91——80

FEDERAL AID SURFACE TRANSPORTATION-HIGHWAYS (FAST-HIGHWAYS) PROGRAM

Effective national transportation policy must recognize that states and their metropolitan and rural regions are often unique in terms of their infrastructure requirements and transportation networks. These regions are sometimes found to be at different stages of development and have different federal/state/local and private relationships, different land use practices, and different approaches to promoting their respective economies.

To successfully respond to this diversity, each state and locality will require a unique mix of capital and operating strategies to meet current and future transportation objectives including metropolitan congestion relief, rural access improvements, increased intermodalism, and preservation of environmental resources. Moreover, these transportation strategies must be integrated with overall environment and quality of life concerns of the communities they serve.

The new national transportation program can support these efforts by establishing simple and direct policies that encourage regional "systems" approaches. One such approach is to analyze and define transportation needs within transportation subregions and corridors.[3] This approach works across modal lines, overcomes jurisdictional boundary provincialism, and transcends the traditional separation of public and private responsibilities.

THE FAST-HIGHWAYS PROGRAM WOULD BE SUFFICIENTLY FLEXIBLE TO ALLOW A BROAD RANGE OF LOCAL TRANSPORTATION SOLUTIONS.

In order to address the nation's growing and diverse transportation problems, Congress needs to create a program that is sufficiently flexible to allow for a broad range of transportation solutions. California proposes the establishment of a Federal Aid Surface Transportation-Highways (FAST-Highways) program that permits state and local jurisdictions to tailor solutions to their unique set of transportation concerns.

The FAST-Highways Program would be notable for the absence of customary categorical designations such as Federal Aid Primary (FAP), Federal Aid Secondary (FAS), and Federal Aid Urban (FAU). The FAST-Highways Program is not, however, a block grant which generally provides little or no accountability to Congress.[4]

The FAST-Highways Program would be evolutionary — moving from the current program based on a series of largely unrelated categories to one directed by Congress through specified goals, objectives, and outcomes. Project selection would focus on addressing national transportation goals and solving problems rather than on numerous spending categories which may or may not address the identified need.

FAST-Highways would assist states and localities pursuing broad national goals and objectives, as set by Congress, through their local collector systems and be funded through the Federal Highway Trust Fund. The FAST-Highways system would consist of all highways (including bridges) functionally classified as arterials, urban collectors, and rural collectors other than those designated as part of the HSNS. Local streets and roads also are not included.

In order to accommodate the differences in relative need among states and regions between the HSNS and the FAST-Highways Program, we recommend that up to 20% of a State's total apportionment for the FAST-Highways Program and the HSNS be transferable from one program to the other.

In addition, states would be required to provide regional/local systems with annual aggregate FAST-Highways apportionments that are no less than the FFY 1991 apportionment that would be

---

[3] *The Corridor/subregional approach seeks the cooperation of all entities affected by a given transportation problem arising within a specific transportation corridor or subregion. Flexible funding from the effected entities would be used to select the best solution without regard to mode. See page 26 for additional details.*

[4] *The FAST program is an incremental extension of the Combined Road Plan demonstration authorized by Congress in Section 137 of the 1987 Act.*

available through urban funds (FAU), secondary funds (FAS), and bridge funds (HBRR) accounts. Since each state has developed allocation processes unique to their own state/local relationships, the process used for allocation of these funds should not be altered by Congress.

Each state, in cooperation with its regional and local agencies, would establish joint guidelines for implementing the FAST-Highways Program. The guidelines would include criteria for setting priorities and encouraging regional intermodal solutions, where appropriate. The guidelines would ensure that administrative costs are minimized through the simplification of processes and the application of controls that ensure accountability for both funds and projects. The guidelines should ensure that each agency has the flexibility to use the funds for those transportation solutions which bring the most efficient increase in mobility and best address regional and local land use, air quality, and economic development issues.

ACCOUNTABILITY

States would be accountable to Congress for the results of expenditures of funds for the FAST-Highways Program and its supporting contribution to the HSNS. Congress would set broad goals and objectives for the FAST-Highways system taking into account the state and local focus of the system. The US DOT, acting as an agent of Congress, would establish specific performance measures which would allow for the differing characteristics of individual states.

One year prior to the expiration of the next Surface Transportation Assistance Act, each State DOT would be required to prepare and submit a statewide report on the performance of the FAST system to the US DOT. US DOT would review and consolidate all fifty reports and transmit a summary of findings and recommendations pertaining to reauthorization of the FAST-Highways Program to Congress.

Suggested Congressional goals and objectives, and related US DOT performance measures which would focus the FAST-Highways Program on those areas perceived to be of major national concern are set forth in Appendix B.

• • • • •

RECOMMENDATIONS TO CONGRESS

1. Streamline and consolidate the many existing categorical programs (e.g., FAP, FAU, FAS, HBRR) into a single new Federal Aid Surface Transportation Highways (FAST-Highways) Program.
2. Define a FAST-Highways Program that makes a significant contribution to national goals and objectives including reduction of metropolitan congestion, improvement of rural access, and provision of local and subregional support of the Federal Highway System of National Significance.
3. Make roadways and bridges (except local streets and roads)[5] not included in the HSNS eligible for FAST-Highways Program funding.
4. Use performance oriented federal oversight of the Federal Aid Surface Transportation Program to support and enhance the existing roles and responsibilities established between the states and localities.
5. Specify that each state apportion an annual aggregate amount of the FAST-Highways Program funding to non-state systems. This apportionment would not be less than the federal fiscal year 1991 amount for urban, secondary, and bridge funds. The process for distributing funds to the non-state systems should be left to state and local discretion and at their discretion allow the use of a Combined Road Plan.
6. Require each state, one year prior to the expiration of the next STAA, to report to the USDOT on the extent to which it has met performance objectives of the type listed in Appendix B.

IMPLEMENTING GUIDELINES FOR FAST-HIGHWAYS WOULD BE DEVELOPED BY THE STATE, REGIONAL AND LOCAL AGENCIES.

• • • • •

[5] *Local streets and roads are those roads not classified as part of the principal arterial, minor arterial or collector systems. They serve primarily to provide direct access to abutting land and access to the higher order systems.*

HIGHWAY PROGRAM FUNDING

The emerging national transportation program should provide to each state the opportunity to use its total resources, including federal aid, in ways that are most responsive to its specific circumstances and objectives. The common denominator among necessarily diverse programs is that each state and local government needs to have the necessary flexibility to address its unique transportation problems.

FUNDING FLEXIBILITY

Flexible funding can be achieved in several ways. For example, the FAST-Highways program would remove many of the federal categorical proscriptions on funding, making it easier for each state to satisfy their unique intra-state and metropolitan transportation needs.

This approach could be strengthened by creating a single intermodal account (similar to the consolidated transportation program in Maryland) in which funding from the mass transit and highway trust fund sources, can be combined to permit metropolitan areas to design integrated highway/transit strategies that best suit their unique circumstances.

HSNS/FAST-HIGHWAYS PROGRAM FUNDING DISTRIBUTION

To provide requisite flexibility, Highway Trust funds would be split 50% for the Federal Highway System of National Significance Program and 50% for the Federal Aid Surface Transportation Program. States would have the discretion to shift up to 20% of their total apportionment from one program to another depending upon their needs.

HIGHWAY APPORTIONMENT FORMULAS

The allocation of federal funds to the HSNS should be based upon factors that correlate well

HIGHWAY TRUST FUNDS WOULD BE APPORTIONED 50% HSNS AND 50% FAST-HIGHWAYS; 20% OF THE TOTAL COULD BE SHIFTED FROM ONE TO THE OTHER.

with the Congressionally defined goals and objectives but are independent of direct HSNS size characteristics. California's proposed funding formula would not, therefore, be based on manipulable factors such as needs, condition, or project cost estimates of a mileage defined system. In other words, it would use formula factors that are decoupled from criteria directly designating the extent of the national highway system itself.

Decoupling preserves the integrity of the HSNS and ensures greater equity in the distribution of trust fund resources. Decoupling can be accomplished by distributing trust fund resources to the states on the basis of factors such as total public road mileage, diesel fuel consumption, and vehicle miles traveled (VMT). This approach provides state by state flexibility in system definition and programming; avoids penalizing those states that have already heavily invested large amounts in their highways; encourages states to be objective in defining their HSNS and reporting its conditions; and utilizes objective and currently available data for allocations.

Specifically, California believes that the apportionment formula should be based on total statewide urban and rural lane miles, total statewide urban and rural VMT, and statewide diesel fuel consumption.[6] We recommend that for the HSNS Program, funds be distributed based on the following formula:[7]

- 2/9 of the funds based on total statewide rural lane miles and VMT;
- 4/9 based on total statewide urban lane miles and VMT; and,
- 3/9 based on statewide diesel fuel consumption.

Funds for the FAST-Highways Program, however, would be apportioned to the states based upon their proportionate gas tax contributions to the federal highway trust fund. In this program, it is especially equitable to use this portion of gas tax collected to meet state and local needs.

Except for a limited high-cost discretionary bridge revolving fund,[8] basic bridge needs should be accommodated within the two Federal highway programs.

FEDERAL/STATE MATCHING SHARES

It is essential for both rural and urban states that the matching ratios for the HSNS program and the FAST-Highways Program be the same. By maintaining the same matching ratios for the HSNS and FAST-Highways Programs, states will have no incentive to "chase" cheaper federal dollars at the expense of the best transportation solution. National transportation policy should be established through Congressionally set goals and objectives for the national highway program not through funding restrictions and matching ratios.

Less affluent rural states with stable or diminishing tax bases and large urban states grappling with local and regional transportation problems need to maintain low state matching ratios across both federal programs. Therefore, the recommended matching ratio for the Federal Highway System of National Significance Program and the Federal Aid Surface Transportation Program should be set at 85 percent Federal/15 percent state/local/other with an optional state/local/other overmatch.

FUNDING GUARANTEES

Historically, the surface transportation assistance act has been designed to provide equitable funding levels for all states and localities. California urges Congress to provide the following equitable guarantees in the current reauthorization:

THE APPORTIONMENT FORMULA SHOULD BE BASED ON TOTAL STATEWIDE LANE MILES, TOTAL STATEWIDE VMT, AND STATEWIDE DIESEL FUEL CONSUMPTION

STATE AND LOCAL MATCHING RATIOS SHOULD BE THE SAME FOR ALL PROGRAMS

---

[6] *Diesel fuel consumption serves as a surrogate for heavy truck use.*

[7] *See Appendix B for further discussion of the formula and example allocation tables.*

[8] *See "Privatization," page 17 for an explanation of the recommended bridge program.*

1. Assure that no state will receive less than one-half percent of the total national apportionment for support of the system of national significance.
2. Continue to apply minimum allocation provisions to apportionments for the Federal Highway System of National Significance Program recognizing the donor state responsibilities to the national system.[9]
3. Return to each state an amount proportionate to its contribution to the highway trust fund under the new FAST-Highways Program.
4. Ensure that all states would receive no fewer federal dollars in 1992 and thereafter under the new program than they received under the current federal aid program in FY 1991 (after adjustment for interstate and interstate substitution completion and for amounts reflective of special demonstration or discretionary funding and other take-downs).
5. Retain the existing federal matching share adjustment for both the HSNS and FAST Programs for states with non-taxable National Forest Lands, Public Lands, Indian Lands, and National Parks and Monuments Lands .
6. Guarantee that annual amounts allocated in aggregate to non-state systems (FAU, FAS and HBRR) would increase proportionately with any increase in the funding for the FAST-Highways Program.

• • • • •

RECOMMENDATIONS TO CONGRESS

1. Adopt reauthorization language that would provide 50 of total federal funding to the Highway System of National Significance (HSNS) and 50 to the Federal Aid Surface Transportation Highway (FAST Highways) Program.
2. Allow each state to transfer up to 20 of its total federal highway apportionment from one program to the other.
3. Adopt a HSNS Program apportionment formula that is decoupled from HSNS definition or needs.
4. Distribute the HSNS funds according to the distribution formula specified on page 9.
5. Base the FAST Highways Program apportionment formula upon each state's proportionate contributions to the Highway Trust Fund.
6. Establish the federal state project funding participation ratios for both the HSNS and FAST Highways Programs at 85 Federal and 15 Other — with provision for state local other overmatch.
7. Adopt formulae for the distribution of highway trust funds with equitable features outlined on page 10.

[9] *Provide for a so-called "Minimum Allocation" (MA). Started in 1983, each state was guaranteed a share of the total federal highway apportionments and allocations that was no less than 85% of their attributable payments to the federal highway trust fund. While a carefully designed allocation system will minimize the number of Minimum Allocation (MA) states, it remains important to avoid a return to the aggravated donor status experience by some states during the 1960s and 1970s.*

Mass Transportation Program

MASS TRANSPORTATION PROGRAM STRUCTURE

Just like the highway component of the national transportation program, it is time to renegotiate the compact between the federal, state and local governments with respect to transit programs. Flexible use and equitable distribution of transit funds, as well as follow-through on current transit commitments, need to be made part of the new mass transportation program.

Importantly, the recommended structural changes are necessary for an efficient and responsive transportation system regardless of the level of resources provided federally.

One of the fundamental tenets of a new national transportation policy, aimed at managing mobility and enhancing cleaner air, must be a commitment to increasing the number of people traveling through a corridor rather than accommodating an ever-increasing number of vehicles. Public transportation or "mass transit" services is necessarily an important element in meeting mobility needs. To deliver full benefit from these services, transit must be envisioned as more than large urban bus or rail networks. Mass Transit must embrace an array of services including use of other high occupancy vehicles such as vans, carpools, and jitneys to meet regional commuter needs.

California believes that the transit and highway programs should be brought together to fully advance the personal mobility of all our citizens. To do so, the transit component of the national transportation program should have a structure similar to that recommended for highway programs. Existing federal transit programs should be streamlined and consolidated into two programs: the Transit System of National Significance (TSNS) and the Federal Aid Surface

WE ARE COMMITTED TO INCREASING THE NUMBER OF PEOPLE MOVING THROUGH A CORRIDOR RATHER THAN VEHICLES

• • • • •

THE MASS TRANSPORTATION PROGRAM WOULD CONSIST OF THE TSNS AND THE FAST TRANSIT PROGRAMS

• • • • •

Transportation-Transit (FAST-Transit). Within this broad framework, the new federal-aid transportation program can establish goals and objectives for the transportation system and allow use of a portion of federal funds for combined transit and highway projects (FAST Programs).

TRANSIT SYSTEMS OF NATIONAL SIGNIFICANCE (TSNS)

The Transit Systems of National Significance (TSNS) Program would be a discretionary program aimed at addressing issues of national significance such as congestion, safety, air quality, economic development, energy, etc. and would support the Highway System of National Significance (HSNS).

The TSNS program would be complementary to the HSNS in meeting Congressionally identified goals and objectives. The goals and objectives for the TSNS would be similar to the goals and objectives for the HSNS. These goals and objectives are listed in Appendix C.

ELIGIBILITY FOR THE TSNS

In order for transit projects to be eligible for the TSNS program, they would have to be within a designated HSNS Corridor (with some possible rural exceptions) and meet all of the first five Congressionally identified criteria plus one or more of additional criteria. Those criteria could include the following:

1. Cost Effectiveness as demonstrated by common performance criteria, including: annual project capital cost per passenger mile, annual system operating cost per passenger, and annual passenger mile per vehicle mile.
2. State/Local Funding Commitment shown by substantial dedication of state and non-state funds for the total project (including multi-year segments) costs as presented in a total viable project financial plan. At least 25% of the system's operating costs should come from value capture.
3. Travel-time Savings demonstrated through reduced travel time costs for peak period travel.
4. System Value of the Project demonstrated by the expected cost and service benefits for the existing intercity and commuter travel and additional benefits to the HSNS corridor.
5. Congestion Management established through improved service standards, increased alternative transportation methods, and implementation of land use and trip reduction strategies consistent with Regional Transportation Plans, Corridor Concepts and Air Quality Plans.
6. Amenities for Passengers including increased passenger comfort and safety would be shown by reductions of overcrowding, increased frequency of service and improved accessibility for disabled travelers.
7. Cost Reduction Strategies implemented as part of a productivity improvements plan.
8. Service Reliability as shown by improved on-time performance, reliability and peak period travel through-put.
9. Passenger Carrying Ability of new guideway starts, new exclusive busway starts, guideway extensions or system enhancements measured by additions to system physical capacity and the market viability of the capacity to be added.
10. Accessibility demonstrated by system increased access for older persons and persons with disabilities, including wheel chair users.
11. Air Quality Benefits measured by reduced vehicle miles of travel and increased person miles traveled.
12. Economic Development indicated through increased opportunity for local and regional economic growth and joint use opportunities.

TSNS PROJECTS WOULD HAVE SPILLOVER BENEFITS FOR THE HSNS.

SUPPORT OF THE HSNS

TSNS projects are intended to provide spillover benefits for the HSNS. Most urbanized areas and emerging corridors in rural areas have limited opportunities for physical expansion of existing HSNS facilities. Those areas must address their growing congestion through enhanced performance of the HSNS brought about by technological advances and augmentations to

VARIOUS EXISTING FEDERAL PROGRAMS WOULD BE CONSOLIDATED INTO THE FAST-TRANSIT PROGRAM.

• • • • •

supporting subsystems (ie., TSNS). In addition to the TSNS program, California has recommended that federal guidelines authorize and encourage (not mandate) states and local agencies to use Federal HSNS Program funds for related improvements within the HSNS corridor. These improvements must be consistent with the metropolitan area's Regional Transportation Plan, Corridor Concept, and Air Quality Management Plan.

FEDERAL AID SURFACE TRANSPORTATION PROGRAM-TRANSIT (FAST-TRANSIT)

The FAST-Transit Program, which would work in conjunction with the FAST-Highways Program, would be a formula apportioned program aimed at pursuing national goals and objectives set by Congress. Similar to the FAST-Highways Program, the national goals and objectives would recognize the state and local focus of the program as well as the FAST-Transit system support of the TSNS and HSNS.

Suggested goals and objectives are listed in Appendix D.

The FAST-Transit Program would consolidate and streamline the various existing federal programs into one program. Eligible project types under a consolidated program would include: capital investment needed to replace and rehabilitate current equipment and facilities; capital investment necessary to retain current market share; new starts and extensions; and transit operating support.[10]

The definition of major capital projects should be broadened to clearly include consideration of fixed guideways, transitway or busway facilities, bus replacement, and exclusive HOV lanes as well as the traditional rail, light rail and expanded bus lines. All forms of high occupancy and shared ride services, and other methods to improve urban transportation efficiency, as well as traditional transit, would be part of the broader definition of public transportation.

• • • • •

[10] *In urbanized areas above 200,000 population, there should be a limit on the amount of the area's apportionment that could be used for operating assistance.*

MASS TRANSPORTATION PROGRAM FUNDING

To address public transportation needs in all areas of the nation, from dense urban to rural, the nation's changing mobility needs must be met through a variety of services and approaches. Each state and local government must have the necessary flexibility to tailor its transportation options to their specific market.

15% OF MTA FUNDS WOULD GO TO THE TSHS PROGRAM AND 85% TO THE FAST-TRANSIT PROGRAM.

The reliability and fair share apportionment of MTA federal funding must be improved through increased reliance on formula allocation and on dedicated funding at the federal level. The substantial contribution of public transportation to the achievement of major national goals provides justification for continuing a commitment of both dedicated and general funds to support mandated actions.

TSHS/FAST-TRANSIT PROGRAM FUNDING DISTRIBUTION

Large discretionary capital elements of a federal transit program distort local decision-making toward capital-intensive transit systems which qualify for federal capital assistance, and lead to the neglect of more cost-effective strategies such as provision of HOV lanes. Major efforts to regulate planning and programming procedures at the local level have had relatively little effect on local decisions in the face of the strong incentives presented by Federal capital and operating assistance programs.

In order to plan and implement comprehen-

sive solutions to public transportation problems, a mix of transportation strategies is necessary. The Mass Transit Account is an important resource that should be made available throughout the nation on a fair and equitable basis.

On a national basis, the Mass Transit Account funds would be split 15% for the TSNS Program and 85% for the FAST-Transit Program. States should have the opportunity to permit regional agencies to shift between or combine their FAST-Highways and FAST-Transit Programs funding in accordance with an adopted Corridor Plan or Regional Transportation Plan.

FAST-TRANSIT APPORTIONMENT FORMULA

Funds for the FAST-Transit Program, would be apportioned to the states based upon the proportionate state contribution to the federal Mass Transit Account.

FEDERAL/STATE MATCHING SHARES

It is essential for both rural and urban states that the matching ratios for the HSNS program and the FAST-Highways and Transit Program be the same. By maintaining the same matching ratios for the HSNS, FAST-Highways and FAST-Transit Programs, states will have no incentive to "chase" cheaper federal dollars at the expense of the best transportation solution. National transportation policy should be established through Congressionally set goals and objectives for the national program not through funding restrictions and matching ratios.

The matching ratio for the HSNS, FAST-Highways and FAST-Transit programs would be set at 85 percent Federal and 15% state/local/other with an optional state/local/other overmatch.

The suggested federal contribution for the TSNS discretionary program would be in the range of 25% to 50% of the project costs which would require 75% to 50% of the project costs to be borne by those most benefitted by the project. The level of cost sharing should be based on a determination of the relative benefits and programmatic interest of the governments involved.

DESIGNATED RECIPIENTS

The current designated recipients of federal mass transit funds and the process for providing for their designation should be retained for the discretionary TSNS program. For the FAST-Transit program, the designated recipient should be the Regional Transportation Planning Agency or the state if no such agency exists for an area.

TRANSITION

Federal financing for public transportation should continue the full amount of general revenue funding that has been authorized for mass transit programs in 1991. All current resources of the Mass Transit Account (taxes plus interest) should be fully invested in an expanded service concept of public transportation. The MTA program financing should use the balances that have accumulated over the past five years to meet long delayed urban transportation solutions and to follow through on the previous commitments in the nine major urban areas.

• • • • •

RECOMMENDATIONS TO CONGRESS

1. Sort out and define a transit mobility program that complements the HSNS and includes a state and local component that complements the FAST-Highways Program
2. Continue to supplement the MTA from the General Fund
3. Distribute no less than 85% of all Mass Transit revenues by a fair and equitable formula
4. Fulfill the federal commitments to the nine major capital projects underway in cities throughout the US
5. Require that no less than 25% of transit operating costs be recovered through value capture

PRIVATIZATION

Despite a widely recognized need for increased funding, it has become increasingly apparent that budgetary constraints at all levels of government severely limit the likelihood of major new infusions of capital from excise tax and other traditional user fees. While the political unpalatability of raising additional taxes is apparent; the need to maintain and improve our transportation infrastructure during the 1990's and beyond presents a difficult and growing problem that federal, state, and local governments must address.

One potential source of additional funds for transportation facilities, not fully developed in the United States, is the private sector. When provided with the opportunity and appropriate environment, the private sector may find effective means to address not only their own business interests but also those of the public as a whole. Encouragement of entrepreneurship to meet the public transportation needs can result in substantial private capital investment, stable funding of critical infrastructure through limited user fees, and a lessening of pressure to raise revenues through conventional taxes. The bottom line is that increased privatization will help bridge the widening gap between transportation infrastructure investment needs and available funding.

Following are several program areas in which private investment can fully or partially contribute to narrowing infrastructure funding gaps.

PRIVATIZATION CAN HELP TO BRIDGE THE GAP BETWEEN NEEDED INFRASTRUCTURE INVESTMENT AND FUNDING.

DISCRETIONARY BRIDGE PROGRAM

A large and growing number of America's bridges are in need of repair, rehabilitation or replacement. Various estimates place the cost of raising to standard 242,000 on and off system bridges at between $45 and $51 billion.[11] In view of the fact that the Highway Trust Fund has recently distributed roughly $12.5 billion each year for all highway and bridge projects in the United States, it would take the entire trust fund distribution for four or more consecutive years to satisfy the estimated bridge needs alone.

Both the proposed HSNS and FAST-Highway programs include bridges as an eligible expenditure. While a separate program for meeting the needs of bridges would be duplicative, it is likely that Congress will, in response to regional concerns, create a separate bridge program in an effort to begin addressing these neglected facilities.

We believe that the most appropriate form for such a program would be a discretionary and revolving fund type annually financed at a maximum level of 2 percent of total highway funding.[12] Clearly, even with massive increases in such a fund, only modest impact on the country's bridge problems can be expected. Other sources of capital must be sought and encouraged if the nation is to have a substantial impact on this growing problem.

Privatization offers one significant supplemental funding source, particularly with respect to the rehabilitation or replacement of larger, high volume bridges. As in the case of "borrowed" funds from a revolving fund, repayment of privately invested capital costs would likely occur through tolls and value capture.

In order to increase the impact of the revolving fund on total bridge needs and to ensure access to these funds for low volume and rural bridges, states could be required to make a good faith effort to first offer the bridge repair or replacement to private interests as a privatization business opportunity. The response to such an offer would serve as a test of privatization feasibility prior to seeking capital from the revolving fund.

Inasmuch as larger, higher volume bridges would be attractive opportunities for private investors, the smaller, low-traffic bridges, typically found in rural areas, would have greater access to the limited funds in the bridge revolving fund. An exemption process should be established for lower volume bridges and states whose legislative bodies have precluded them from private toll bridge operations.

HIGH-VOLUME BRIDGES HAVE HIGH PRIVATIZATION POTENTIAL.

[12] *FFY 89-90 Bridge Discretionary funded at $225 million.*

PRIVATIZATION OF SAFETY ROADSIDE REST AREAS COULD LEAD TO AN INCREASE IN THE NUMBER OF REST AREAS.

SAFETY ROADSIDE REST AREAS

Many states are finding it increasingly difficult to construct and maintain adequate numbers of roadside rest areas along their major roadways. In some instances, existing roadside rests are being used for illegal activities including smuggling, drug distribution, and associated crimes against people. In addition, increasing maintenance costs are discouraging the development of additional new facilities and are creating growing pressure for deferred maintenance. As a direct result, some states have found it necessary to close certain rest areas to the public. As more and more highway miles are logged by the public, this presents a serious and growing safety problem.

Privatization can be harnessed to satisfy both public and business interests as they relate to roadside rest areas. Private interests can be attracted to long-term lease arrangements under which profit-making facilities located in the rest area (within the highway right of way) can serve as the incentive to maintain free public services such as parking, picnic areas, restrooms, security, etc. Through the operation of service stations, restaurants, retail outlets, and vending, private operators would be required to maintain all for-profit and free service facilities, including pavement, structures, lighting, landscaping, and provide for the protection of the public. Net lease revenues collected by government could be used to construct additional and badly needed rest areas at other locations.

HSNS PROGRAM

Conceptually, the HSNS is composed of those roadways that address direct national interests including defense, international trade, interstate travel, domestic commerce, and related concerns. The interstate system of roughly 43,500 miles along with some portion of other major roadways serving these direct interests, would be identified and made eligible for funds allocated for the HSNS program. Even a system only modestly larger than the existing Interstate will become increasingly difficult to maintain in view of the age and use of the system.[13]

In view of the limited funds available for the protection of the national system, it may now be appropriate to consider the use of retrofit tolls on selected portions of the HSNS. Tolling could be allowed only at the discretion of the US DOT Secretary with all net revenues earmarked for preservation (rehabilitation, resurfacing or restoration) projects on the tolled HSNS segment. Any toll revenues in excess of the amount required to preserve the tolled facility would remain within the respective state for use on other HSNS routes.

• • • • •

1% of the nation's highways carry 21% of all traffic.

An example of such authority may be found in the Social Security Act at 42 USC, Section 1315. The authority granted to the Secretary of Transportation could also include authority to seek waivers or suspensions of provisions of statutes other than 23 and 49 USC (for limited periods of time).

RECOMMENDATIONS TO CONGRESS

1. Create a separate revolving bridge fund, administered at the USDOT Secretary's discretion and funded at a maximum level of 2 percent of the total highway apportionments. This bridge program also should require, as a precondition for funding, proof that the jurisdiction applying for funds has made a good faith effort to promote private investment in and operation of the facility.
2. Permit states to allow private-for-profit enterprise to locate at roadside rests in return for lease income (to be used to construct additional roadside rests) and full maintenance of the roadside rests' free public services.
3. Authorize states, with the approval of the Secretary, to place retrofit toll facilities on selected segments of the HSNS that are beyond their design life, provided that all net revenues are used for rehabilitation, resurfacing, and restoration projects on the tolled HSNS facilities.
4. Authorize the Secretary to permit States to "buy out" at current market value, the federal investment in federally aided transportation facilities, rights of way, and bridges.
5. Authorize the Secretary to waive the NEPA process on private facility connections to federally aided facilities when it is determined that the connection has only minor impact and the State's environmental clearance process has been determined to be functionally equivalent to the NEPA process.
6. Amend existing tax codes to provide for accelerated depreciation, favorable treatment of losses and access to tax exempt financing for privately-built publically-owned transportation infrastructure.
7. Establish the position of full time ombudsman for transportation privatization at US DOT who will have access to the Secretary and who has modal and functional cross-cutting authority.
8. Give the US DOT Secretary demonstration authority to waive sections of Title 23 and 49 USC and associated regulations or directives for purposes of encouraging and exploring privatization efforts.[14]

CONSIDERATION SHOULD BE GIVEN TO RETROFIT TOLLS ON THE HSNS.

• • • • •

CREATIVE FINANCING

It is expected that preservation of the transportation system will include Transportation System Management (TSM), restoration, resurfacing, rehabilitation (3R), capacity expansion, and other improvements. However, in rapid growth areas, high cost capital projects may be necessary.

Creative financing techniques (ie., advanced construction funding, toll provisions, and multi-state compacts), may be needed along with regular formula apportionments. Recent use of the term "creative financing" has drawn greater attention to the overwhelmingly obvious fact that traditional government user fees can no longer be considered the sole source for transportation infrastructure capital.

CREATIVE FINANCING CONCEPTS SHOULD BE AVAILABLE ON A PERMISSIVE BASIS.

Although creative financing concepts are potentially useful to the nation as a whole, states experiencing rapid growth most likely will find that innovative and creative financing is necessary in all aspects of their transportation improvement program. Therefore these concepts should be made available on a permissive rather than a mandated basis.

To varying degrees, states and local governments have made use of a variety of devices as means of supplementing the more familiar user fees. Among these are local sales taxes earmarked solely for transportation; developer and special district fees intended to compensate for the additional trip demand created; limited privatization of small projects funded by entrepreneurs to create access to developable land; and more recently in Virginia, Florida and California, the creation of processes that will lead to large private capital investments in major toll transportation facilities (See page 16 to 19 for additional details.)

In recent years, Congress has "reformed" the tax code to sharply curtail federal tax exemptions for certain state and local bonds. While this action has eliminated some egregious abuses, it has had the unintended side-affect of sharply limiting public-private sector partnerships that provide many needed transportation physical improvements. Perhaps it is time for Congress to review its policies with respect to state and local tax exempt bonds and to restore incentives which will effectively encourage increased private participation in public transportation projects.

Federal tax laws, which provide significant incentives to auto use and none for transit use, also should be revised to support national objectives and to create a more level playing field among modes.

PUBLIC CAPITAL CREATION

In addition to direct user fees such as fuel taxes, registration fees, licensing fees and the like, state and local governments are accustomed to issuing long-term tax exempt debt backed by general revenues (general obligation bonds) and future revenue backed bonds (revenue bonds). The cost or interest on government issued long term debt is generally an indication of the credit worthiness of the governmental entity or the level of confidence in the projection of future revenues. General obligation bonds are, as the name implies, backed by the "full faith and credit" of the issuing government. Revenue bonds are customarily backed by expected revenues from specific sources such as tolls, developer fees, special assessments and the like.

In recent years, governments have begun to use more creative approaches to supporting long term debt. Among the devices being used are:

Special Benefit District Fees: Under this approach, capital is raised (or debt retired) through fees representing the improved service received by the district as a direct result of the construction of new or improved infrastructure. Special districts are usually defined as all "beneficiaries" within specified distances (benefit areas) of the new facility.

Tax Increment Districts: Tax increment districts, similar in many ways to special benefit districts,

retire debt or support operations of new facilities through a local government commitment of the incremental increase in property taxes (value) that results from the new or improved infrastructure. In over simplified form, a property with an assessed value of $100,000 and taxed at $5,000 annually prior to the addition of a new roadway, increases in assessed value as a result of better highway access, to $150,000. The property tax based on the increased value would therefore be $7500 annually or $2,500 more than prior to the construction of the new roadway. That increment ($2,500) is used to retire outstanding debt or support operating costs (ie., maintenance) associated with the improvement.

Developer Fees: Developer fees are assessed on new residential and commercial development on an unit basis (e.g., per single family residence; per square feet of commercial space; etc.) in recognition of the need to accommodate increased travel demand created by the development.

In-Kind Contributions: Unlike developer fees, in-kind contributions may include voluntarily donated rights of way, buildings, developable land that the government may use in an asset management program (i.e. swap, sale, co-development, etc.).

Air Space Lease Revenue: Over, under and around most transportation facilities are large amounts of unused "air space" which often go unrecognized as valuable and manageable assets. While airspace leasing has developed slowly, it represents a highly valuable and untapped income generator. Examples include the lease of airspace within the right of way for commercial space such as, small business locations, office towers, retail outlets, and recreational attractions.

Sale of Governmental Facility Leases: A novel, and to the best of our knowledge yet untried, method for raising public capital is the sale of long term leases on existing transportation facilities. Under this concept, the lessee places a toll sufficient to maintain and operate the facility as well as service outstanding debt and provide an adequate rate of return. One example of such an arrangement might be the sale of a lease of up to 35 years on an existing bridge or roadway segment. The lease issuing governmental entity receives a lump sum of cash equivalent to the "value" of the lease and the lease holder's tolls return a reasonable profit. The facility remains a governmental property while the proceeds of the lease provide heretofore inaccessible opportunity value.

PRIVATE CAPITAL CREATION

In addition to capital raised through long established private equity and commercial debt markets, and the limited use of tax exempt industrial development bonds, private capital debt service may take place through several other less commonly used approaches. Among these are:

Tolls: Under privatized development of transportation facilities such as the planned extension of the Dulles Airport access road in Virginia, tolls will be used to retire capital debt along with meeting maintenance and operating obligations.

Public Contributions: Under certain circumstances, public funds may be contributed as seed money to encourage privatization of transportation facilities.[15] The donation of unused public lands, buildings or existing transportation facilities might also be used as inducements for privatization.

While certain issues related to the use of public funds and the relationship such use creates, public capital could provide a significant portion of total capital needs for privatized infrastructure. Of critical importance in such arrangements is the extent to which public dollars bring with them public obligations beyond those associated with repayment or equity interests.

---

[15] *For example, in California, the Orange County Transportation Commission has offered $300,000 to the private sector as seed money for the study of two county transportation corridors.*

Public funds, unencumbered by major public policy conditions, may provide the gap filling private capital extender needed to attract private investment to public infrastructure particularly in marginal cases.

Sale of Development Rights: Development rights associated with the airspace surrounding a facility, at station locations in the case of rail, at rest areas on highways, or on easily accessible parcels served by interchanges, could be sold to raise capital. Alternatively, the principal transportation developer might retain an equity interest in co-development facilities, thus ensuring an income stream well into the future.

Assumption of Existing Toll Facilities: A very novel approach to attracting private capital is the donation of an existing toll generating facility as government's contribution to inducing additional development in a particular corridor. One recent example of this was the "donation"[16] of the Dartford toll tunnel between Essex and Kent, England to a privatization consortium that will build a bridge over the Thames River. Unknown is the extent to which the consortium was required to accept additional governmental regulation along with the tunnel toll proceeds.

• • • • •

RECOMMENDATIONS TO CONGRESS

1. Delete from the tax code limitations on the use of industrial development bonds for privately built publicly owned infrastructure and that Congress increase substantially the authorized cap
2. Permit the sale of lease hold rights in public facilities provided that the federal interest in such facilities is reimbursed
3. Permit states and local governments to contribute rights to existing toll facilities as a means of inducing private investment in additional corridor facilities
4. Provide to all modes tax incentives now enjoyed by automobile users

[16] *Trafalgar House, the winning bidder, paid the government an amount equal to the outstanding debt on the tunnel.*

INTERCITY RAIL

Metropolitan congestion is not merely a problem that effects individual mobility but one that adversely impacts real estate values, air quality, energy consumption, economic development, and international trade. In spite of its broad impacts, metropolitan congestion will be largely addressed under a common and complicating constraint: the 21st century's freight and passenger services to metropolitan America will move on corridors that exist today.

At the same time that debilitating gridlock reduces the effectiveness of our highways, our airports, and our economic centers, we have a passenger and freight railroad system that is, in many respects, severely underutilized. Moreover, our private railroads represent a significant resource with untapped mobility potential that can be utilized without large public investment.

The nation has been slow to respond to the needs of the environment and have relied heavily (perhaps too heavily in many corridors) on highways and rubber tire vehicles for intercity travel. The expanded use of our often sparsely used railroad system should play an increasingly important part in an overall approach to transportation policy. Therefore, major opportunities exist for a rejuvenated private railroad industry. Well targeted public investment, in concert with private capital, can create complementary intermodal facilities that capture the highest and best use of multimodal services in major corridors.

OUR PRIVATE RAILROADS REPRESENT A SIGNIFICANT RESOURCE OF UNTAPPED MOBILITY POTENTIAL.

Among the improvements needed to stimulate greater railroad utility are changes to a tax structure that now discourages both public-private and additional investment. Public policy should preserve established private infrastructure (pipelines as well as railroads) by encouraging additional value capture opportunities and by favoring intermodal connectivity that helps bring these services more into the mainstream. Where passenger rail service cannot be solely supported by farebox revenues, revenue streams produced by associated joint development can help produce a profitable enterprise.

HIGH SPEED RAIL

High speed rail (HSR) technology offers unique opportunities to provide significant gains in travel efficiency and productivity, with relatively low energy and land need impacts. HSR by offering frequent, swift, and dependable service, can divert travellers from congested highways and airports. Northeast Corridor operations show that HSR can compete favorably with jet aircraft in high density, short haul markets. Such competition allows individual modes or combinations of modes to find their most efficient niche.

GOVERNMENT POLICIES SHOULD ENCOURAGE PRIVATE DEVELOPMENT OF HIGH SPEED RAIL.

Federal and state governments should support and encourage the development by private interests of state-of-the-art high speed intercity rail passenger service in select high density travel corridors. When properly sited, such high speed rail systems may generate sufficient passenger and value capture revenues to recover capital and meet operating cost needs.

Therefore, to encourage the development of high speed rail, private-public partnerships should be encouraged. Such partnerships can be made easier through public authority to authorize competitive franchising or concession arrangements.

RECOMMENDATIONS TO CONGRESS

1. Review and change the existing tax structure, where necessary to encourage private investment in passenger and freight rail systems.
2. Encourage use of federal and state HSTIS funds to support capital intercity rail investment that will relieve congestion on major intercity corridors.
3. Permit states access to rail corridors (under franchise or concession agreements) which may be subject to the exclusive rights of AMTRAK when that state has an economically viable alternative to AMTRAK service in that corridor and and the viability of its national railway network is not threatened.

Special-Interest Projects

It is apparent that special interest or so called "demonstration projects" are the result of two important Congressionally recognized needs. First, the larger and more important demonstration projects often address gaps in national policy that have developed during the past two decades. Even as the interstate program was taking its course, it became apparent that numerous emerging transportation problems of national and local concern such as interstate connections to new growth areas and intermodal connections to air and water ports were not being adequately addressed. In response, Congress often used its demonstration project authority as a means of solving many serious oversights. Use of demonstration projects to solve future unanticipated problems would become less necessary if Congress broadens the federal system concept as outlined in our Highway Program Structure (See page 5). For example, under the California structure, interstate connectors to new growth areas and intermodal projects such as those providing access to air and water ports will be more readily addressed as part of the HSNS.

Secondly, demonstration projects also are used to address local priorities which have been unable to compete favorably with other national and statewide priorities. As in the case of intermodal projects, local priority projects will compete better under the recommended new highway program structure if adopted by Congress.

To insure their effectiveness, special interest projects should meet certain funding and programmatic criteria before receiving authorizations and appropriations from Congress. These criteria require a determination that:

- The project ranks among the highest priorities set by local jurisdictions;
- it is a high priority among statewide transportation projects; and
- state/local agencies are willing to substantially share in the cost of the project.

A suggested federal contribution in the range of 25% to 50% would require 75% to 50% of the project costs to be borne by those most benefited by the project. The level of cost sharing should be based on a determination of the relative benefits and programmatic interest of the governments involved.

Finally, special interest projects should be funded outside a state's current obligational authority so as not to adversely impact state/local priority driven program continuity.

• • • • •

RECOMMENDATIONS TO CONGRESS

1. Congressionally sponsored demonstration projects be selected from projects considered high priorities of the state and local governments
2. Such demonstration projects require that a substantial but reasonable share of the costs be borne by the state and local governments
3. Demonstration projects be funded outside of minimum allocation and obligational authority levels

SPECIAL INTEREST PROJECTS SHOULD MEET FUNDING AND PROGRAM CRITERIA.

• • • • •

PLANNING

Today it is axiomatic that transportation planning must be linked with land use, air quality, economic competitiveness and related sub-issues. Yet most current transportation planning processes were established when the primary objective was to spend a large single source of revenue on interstate highways linking major cities.

A BALANCED SYSTEMS PLANNING APPROACH IS NEEDED.

The time has come to look beyond the single objective investment strategies of the past and make transportation investments that fully consider public priorities and that provide the greatest multiple benefits. A balanced systems planning approach recognizes the advantages provided by each mode, the benefits to be derived from intermodal linkages, and the appropriate application of new technology. Transportation investment decisions and the products of transportation planning must be viewed directly as tools to increase economic growth, improve air quality, and conserve energy resources, as well as improve mobility.

NATIONAL PLANNING

NATIONAL POLICIES AND PLANNING REQUIREMENTS SHOULD BE MUTUALLY REINFORCING.

At the national level, planning should focus directly on how well transportation investments support achievement of major national goals. At the state and local level, direct attention must be paid to how those investments serve the unique and varied circumstances, goals, and priorities of local communities and regions. New national policies and programs must emphasize development of a more strategic view of what must be accomplished at all government levels,[18] and provide a framework for measuring progress of the program partners.

A national transportation policy should set the direction and encourage both strategic and coordinated planning. Congress can set the leadership example by ensuring that frequently conflicting national policies and planning requirements are mutually reinforcing. National transportation policy should be administered in coordination with other federal agencies such as the Departments of Housing and Urban Development (HUD), Health and Human Services, Labor, Energy and Environmental Protection Agency (EPA).

STATE AND LOCAL PLANNING

The mobility problems facing metropolitan America today cannot be solved by any single solution. They must be met by a combination of capital and operating strategies where the environment and travel demands of each regional area are matched by a supply of service that is feasible in those circumstances. What works in urban Los Angeles, may not work in Petaluma, CA, New York City or in Bangor, Maine. The planning for development of our transportation systems must consider issues of system integration and regional impact, as well as local needs and plans.

There are categorical proscriptions in current federal law that can interfere with funding the highest priority transportation projects. They impose arbitrary restrictions on how funds can be used, what transportation mode they can be spent on, and the rigid geographic distribution of funds. As a result, each element of the system competes with all others, constituencies become entrenched around their special interest and the intermodal integration of systems, so essential to the overall functioning of the transportation network, does not occur.

Need for Corridor/Subregional Approach

Currently, transportation decision making is made by numerous entities including the state, cities, counties, transit districts, transportation commissions, special transportation authorities,

[18] *Recognize, for example, that congestion relief within HSNS corridors whether attained through investment in traditionally federal or traditionally local systems, both potentially can serve the essential national interests.*

regional transportation planning agencies, air pollution control districts, and land use regulators. Each level of government has something the others need for the success of their own goals. While each of these diverse agencies has an unique focus they also share a common (if not always recognized) interest at the regional or subregional level.

Transportation solutions must originate and be implemented where the problems occur. The federal, state and local governments must work together at the regional and subregional levels to develop, agree upon, and carry out specific solutions. In the interest of producing the best solution to a particular problem, the state, the regions, and the affected cities and counties may find that the corridor/subregional transportation planning approach will:

- Better link land use, air quality, transportation planning and programming, and implementation across jurisdictional boundaries.
- Promote intermodalism and better target limited resources by ensuring that the most cost effective transportation solutions are identified, given appropriate priority, and funded.
- Begin to integrate state highways, county roads, city streets, and transit facilities into a single coordinated and well tuned system.
- Promote direct and vigorous participation of all corridor jurisdictions in the planning, programming, and implementation process.

Corridor/Subregional Approach Defined

The "corridor/subregional approach" is an extension of the current "3C" transportation planning efforts and is designed to address transportation problems and prioritize and fund their solutions. The corridor/subregional approach addresses transportation problems in both rural and urban systems on an intermodal and multijurisdictional basis.

Simply put, all responsible regional decision makers would be brought together directly through states auspices or through MPOs. Together they would develop an integrated program of improvements (including all modes/strategies), pool funds to pay for the program and then jointly implement it. To accomplish this, there are four elements in the existing planning, programming, and implementation process that are either missing or that need to be strengthened:

Binding commitment. There must be commitment on the part of each agency to seek common solutions in the corridor study effort, to develop a workable plan of financing, and to follow through in implementing their respective portions of the integrated program.

An **integrated program** of intermodal improvements to increase capacity and to reduce congestion. This means combining demand management measures, transit improvements, and new capacity whether on state or local facilities into one subregional network package. Without an integrated and coordinated system of good arterial networks, transit systems, traffic operations centers, and demand management, additional freeway development will be of little benefit in addressing urban transportation problems.

A **flexible pool of money** to fund the implementation of the plans and to ensure that the funding is applied to the plan's integrated program and its agreed upon priorities. This would be accomplished through the authorization of the FAST-Highways and FAST-Transit Programs recommended on pages 6 and 13 and the HSNS metropolitan corridor process described on pages 5 and 12.

A **coordinating mechanism** developed by states and localities — or use of the existing metropolitan planning organizations.

How The Process Works

The corridor/subregional approach is a method to address the subregion's problems as a whole. The elected officials and civic leaders must be committed to resolving transportation problems without preference for a specific mode, facility or agency. The operating premise must be that each player benefits as the group succeeds.

TRANSPORTATION SOLUTIONS MUST ORIGINATE AND BE IMPLEMENTED WHERE THE PROBLEMS OCCUR.

• • • • •

CORRIDOR/ SUBREGIONAL PLANNING IS AN EXTENSION OF THE EXISTING "3C" PLANNING PROCESS.

• • • • •

The state, in cooperation with its local and regional agencies, would develop guidelines for the conduct of corridor studies. These guidelines would include a method for prioritizing among studies to be done; identification of funding; targeting the modes to be studied; exploration of land use, population, and air quality considerations; and a priority setting system for projects within corridors.

CORRIDOR PLANS MUST BE CONSISTENT WITH AND INCORPORATED INTO ALL STATE, REGIONAL AND LOCAL PLANS.

Where appropriate, the Metropolitan Planning Organization (MPO) would be responsible for the overall process of identification of corridors, ensuring public involvement, scheduling of studies in the annual overall work plan, and conducting or having conducted the corridor studies. The State may be responsible for this process wherever a corridor is not being studied by the MPO (for example, a rural corridor). Upon completion of the studies and following a public hearing, the corridor study is amended into the Regional Transportation Plan (RTP), and included in the Regional and State Transportation Improvement Programs (RTIP and STIP). Corridor plans must be consistent with and incorporated into all state, regional, and local plans or a resolution of overriding considerations must be adopted. Strict time limits would be set for completion of these steps. A conflict resolution process such as binding arbitration and expedited judicial reviews would be used to break logjams in decision-making.

As the planning of integrated improvements and strategies (e.g. transit, arterial network expansion, freeway operational improvements, demand management ordinances, etc.) proceeds, consideration of funds available in the corridor and funding responsibility for each improvement and strategy would be determined. The result would be a final plan that specifically delineates the integrated program of improvements and strategies and describes how the individual program elements would be funded. Subsequent project approvals and funding would take place in accordance with the priorities established in the corridor plan as amended into the RTP.

Corridor/Subregional transportation planning represents a major shift in transportation planning and funding. It takes a more regionalized and localized approach to solving urban and rural transportation problems — addressing

them within a more intermodal and multi-jurisdictional framework. It focuses authority and responsibility at the regional and local levels and begins with comprehensive, detailed, and integrated corridor studies. Through these studies, priorities are set from the full range of highway construction, public transportation, traffic management, and other available approaches.

FEDERAL FUNDING FOR PLANNING

Currently, separate planning money is available for transit and highway planning through UMTA and FHWA. Little or no federal funding is provided for federal air quality, energy, or aviation (groundside) planning requirements. The federal planning money for transit and highway facilities must be expended within urbanized areas and for the specific mode for which it was intended for. This hinders a state or local agency's ability to take a balanced approach to its transportation planning or its ability to look beyond its current physical boundaries.

Under the corridor/subregional framework, federal planning monies will be effectively distributed without regard to modal definition. Generic transportation planning money will encourage the development of plans which encourage intermodal solutions and link transportation with land use, air quality, economic competitiveness, and related sub-issues.

ACCOUNTABILITY

To ensure that the federal planning funds are being used to address national goals, Congress can require a biennial evaluation report to be submitted from each state to the US DOT. The report would be used to certify the adequacy of the state and local planning and programming process. The US DOT would then be responsible for consolidating the states' reports and submitting them to Congress.

The planning process evaluation report would cover: responsibilities and roles of the state and local planning agencies; progress of planning efforts; national policies, laws or regulations inhibiting the states or local jurisdictions from meeting their transportation goals; significant issues identified through the planning process; innovative planning approaches; and, findings and recommendations.

This approach ensures Congressional oversight and recognizes that the specifics of how to conduct its planning and programming should be left largely to each state and its local agencies to decide upon.

• • • • •

RECOMMENDATIONS TO CONGRESS

1. Establish an overall national strategic direction
2. Fund intermodal, continuous, coordinated, and cooperative planning at the state and local level which advances the strategies chosen
3. Mandate that the US DOT Secretary establish broad, flexible federal guidelines — and that the guidelines require each state and its local entities to create a planning process appropriate to each state's respective physical, political and related circumstances.[19]
4. Through the US DOT Secretary, require that a state certify that its program of projects is based on a comprehensive multimodal transportation planning process carried out cooperatively by states and local agencies
5. Hold each state accountable for the results of their transportation planning and programming by requiring each state to submit a biennial evaluation report

FEDERAL PLANNING MONIES WOULD BE DISTRIBUTED WITHOUT REGARD TO MODAL CONSTRAINTS.

• • • • •

19 In doing so, Congress should carefully avoid mandating a specific process as many states have created effective approaches that perform well in their respective political, economic, and geographic environments. States without such a process should be provided a reasonable amount of time in which to develop one.

Research and Development

The Nation must invest in ideas and technology, as well as in education and infrastructure, to maintain its position in the growing world marketplace. To cease losing ground technologically, the United States public sector must begin to exercise the same level of leadership that is provided by the governments of competing nations. This will require direct federal support for civilian research and development, as well as new incentives for renewed private sector investments.

USDOT should act as a catalyst, facilitator, and entrepreneur in helping to develop and direct a national R&D program. Following are suggestions of actions that can be taken at the federal level directly or in partnership with other levels of government and the private sector:

- Establish a national transportation technology research and development program to be coordinated by a nationally recognized blue ribbon panel. The panel would target promising experimental technology and supporting special interest projects which accelerate technology transfer. The highest priority would be given to methods and technology with the potential to maximize existing capacity, create more efficient system links, and otherwise provide the greatest levels of congestion relief.
  - Standardization of new technologies on a national and international basis to minimize system incompatibilities should be a major part of the new federal role.
  - An expanded research agenda would include high-speed intercity ground transportation, goods movement, freight flow, systems management and methods for reducing the cost of new facilities. Any federal research initiative would continue to have an economic component which identifies the link between mobility enhancement and economic growth.
- Take a lead role in identifying and applying new technologies for massive transportation projects which affect multiple jurisdictions or require a centralized funding source. Provide extensive coordination among players and work with state and local entities.
- Strengthen the state/local and private sector commitment to research and development. Support research forums (consisting of regional university, public entity and private sector consortia) and help to develop (or strengthen) regional planning and operational entities that provide a network for intermodal systems approach to mobility.
- Increase the involvement of the private sector by allowing tax incentives, improve tort protection, and antitrust waivers for cooperative efforts. Make provision to grant proprietary interests in applied technology.

• • • • •

RECOMMENDATIONS TO CONGRESS

1. Establish an aggressive intermodal research and development agenda to be coordinated by a nationally recognized blue ribbon panel.
2. Set aside no less than 3% of the total highway, transit and aviation trust funds and commit challenge grant funding for research and development programs to be conducted by states, private consortia or educational institutions consistent with the national agenda.
3. Authorize the Secretary of Transportation to waive selected provisions of Title 23 and 49 and corresponding provisions in regulations for the purpose of experimentation and demonstration of new concepts and proposals.
4. Examine and amend the antitrust and tort liability statutes as necessary, to encourage private investment in research and development while protecting proprietary interests and competition.

THE US DOT SHOULD FACILITATE AN AGGRESSIVE INTERMODAL R&D PROGRAM.

• • • • •

Air Quality And Energy

While many environmental problems affect specific geographic areas, air quality and energy have regional, state, national and international environmental and economic implications. International efforts to deal with global environmental issues such as ozone depletion, energy conservation, and greenhouse warming, have resulted in regulations and agreements that impact international transportation. As these concerns are addressed, the US should anticipate, and participate fully in such international efforts to ensure that US interests are served.

AIR QUALITY SHOULD BE A PERFORMANCE OBJECTIVE FOR THE ENTIRE TRANSPORTATION PROGRAM.

• • • • •

At the state and local level, many transportation and land use decisions have been insensitive to air quality considerations. Despite the creation of air quality programs and air quality enforcement districts, there has been a continuing degradation of our air quality in our major metropolitan areas. Currently, 55% of the nation's population lives in federally designated nonattainment areas. In some larger urban states, this percentage can be significantly greater (e.g., In California 85% of the population now lives in non-attainment areas).

We believe that the nation would benefit from a program that would provide incentives or rewards for addressing air quality objectives at the front end of the transportation and land use planning process. Such a process would provide the flexibility needed at the state and metropolitan level to select and fund projects that best address each area's unique problems.[20] States or local jurisdictions that take air quality considerations into account and implement corridor approved projects beneficial to air quality concerns could be rewarded, for example, with additional planning funds.

• • • • •

RECOMMENDATIONS TO CONGRESS

1. Assure that all national transportation, air quality and energy policy is implemented through mutually reinforcing requirements.
2. Include improved air quality, and decreased energy use as performance objectives for the HSNS, TSNS, and FAST Highways, Transit programs.
3. Distribute incentive planning funds to states and local agencies addressing air quality problems through a corridor/subregional approach.
4. An advisory group of state and local transportation agencies be formed to help develop more detailed recommendations for transportation related air quality programs to the Administration and Congress.

[20] *See the discussion of the Corridor/Subregional approach to planning on pages 21 to 29.*

INTERMODALISM

Modern intermodalism involves the systematic use of two or more modes in order to maximize the efficiency of the total movement. Intermodal air, sea, and surface systems already are a vital part of current national and international transportation. Nevertheless, our historical patterns of economic growth, private transportation investment and government regulation have favored the establishment of competitive, multi-modal systems rather than connected, cooperative, fully intermodal ones.

Our future ability to extract the maximum efficiency from our existing passenger and freight infrastructure and systems will substantially rest on the strength and quality of the service links between the modes and how those links facilitate the efficient substitution of one mode for another. Policies which do not consider new intermodal mixes risk giving up the benefits of their joint efficiencies.

We are at a crossroad in the development of our nation's future transportation programs. Our leaders must decide whether or not we will

WE MUST ENCOURAGE THE GROWTH OF INTERMODAL COOPERATIVE, AND INTERDEPENDENT MODAL SYSTEMS.

WE MUST DECIDE IF WE WILL CONTINUE TO EMPHASIZE INDEPENDENT, COMPETITIVE MODAL DEVELOPMENT OR SHIFT EMPHASIS TO INTERMODAL, COOPERATIVE SYSTEMS.

continue to emphasize independent, competitive, multimodal development or shift emphasis to encourage growth of intermodal, cooperative and interdependent systems. In doing so, it should be recognized that there are strong reasons for establishing future programs with greater intermodal emphasis:

- Intermodal systems already have become a large part of our domestic transportation network; they are now too large and too important not to receive direct attention in future program planning and in allocating public resources.
- We cannot afford to meet the maintenance and development costs of our current independent, modal scheme — our systems are both mature and unbalanced — we need to fully use all existing capacity through greater intermodal linkages and synergies before we commit large sums to overburdened single system solutions.
- Our future ability to effectively conduct international trade substantially depends on the quality of our aviation and waterborne intermodal systems — including the ease of access to transfer facilities and efficient connectivity between the modes.

Our economic position is hurt whenever major system elements slip through the cracks of a multimodal single system framework as is the case with orphan airport and waterport access improvements. If the nation is to maximize the efficiencies possible from its transportation lifelines, it can ill afford to scatter its resources simply because no direct program will cover the need. It cannot continue with fragmented institutional control of public transportation services. Clearly, national resources will be wasted if we make decisions about increasing productivity thorough single system/modal improvements without first considering gap plugging, intermodal alternatives.

General Development Area — There are several system development areas where public sector involvement can help improve the efficiency of the goods movement system and substantially reduce the level of through truck traffic on congested urban highways. These include:

- Helping to improve rail access to key regional transportation facilities and interchange points including ports, goods distribution centers and inland containers stations.
- Assisting in the elimination of right of way clearance restrictions that limit the widespread availability of doublestack rail service.
- Resolving conflicts which limit steamship/rail/trucking connectivity. For example, both steamship lines and railroad carriers can legally handle containers that exceed highway truck size and weight laws. This creates problems ranging from small trucking firms bearing the negative economic impact of fines for overweight operations to regional and competitive issues where overweight laws are unequally applied.

Landside access to airport and waterport facilities is as critical to trucks and railroads as dredged channels and adequate airside systems are to ocean and air line-haul carriers. Yet little focused, concerted attention is given to these access issues by government programs. Other water/truck and air/truck issues which are related to improved systems efficiency include reduction or elimination of highway deficiencies which prohibit or limit 102" truck access to airports and support for the testing and implementation of various technologies like Automated Vehicle Identification and Location (AVI/AVL) systems—which through more direct routing can reduce excess pickup and delivery vehicle miles traveled and speed movements through intermodal facilities.

Urban Transportation — Urban transportation officials must come to grips with general congestion, access to jobs and neighborhoods and related environmental/social problems. In doing so, new collection and distribution systems are being used to maximize existing capacity and

increase the advantages to be gained from new investments. Satellite transportation terminals, high occupancy vehicle lanes, intersystem links between bus, subway, rail and ferry systems are all part of the intermodal options that can be employed.

The smoothness of a journey to work or an intercity trip often depends on how well local transportation planners and system operators are working together to arrange convenient interconnections from these diverse options. In most metropolitan areas, umbrella public transit agencies provide modally independent services. These diverse operations are subject to local institutional and political imperatives and shaped by a fragmented, single system/single mode policies and programs.

Regional interagency planning efforts are required so that the systematic interrelationships of public and private transportation systems can be comprehended and effectively responded to. Each region contains a few key transportation corridors within which travel shifts and growth takes place. Corridor based interagency management of intermodal transportation options should be recognized as essential to meet future transportation needs.[21] Likewise, addressing broad issues relating to public institutional arrangements that straitjacket intermodal service development should be a major national priority.

Airport Access — Intermodal transfers at airports can involve a broad variety of modes: autos, buses, trains, vans, taxis, limousine, helicopters, ferries and trucks of all sizes and shapes. Over half the major airports in the country have serious access problems. The situation is exacerbated by institutional inattention and indirect funding. Airside systems are receiving increasing funding to improve safety and capacity — but support for landside systems, which have only limited funding sources, have not kept pace.

The funding gap for airport access is a clear example of the shortcomings with single mode, single systems focus. No current aviation program — the Airport Improvement Program in particular — will pay for airport access planning or for off-airport access improvements for physical roadway or transit systems improvements. This funding gap is not taken up anywhere else. The support gap needs to be resolved for airports to reach their maximum capacities as efficient intermodal facilities — a critical requirement for both regional and national economic development.

Government at all levels must address major needs that suffer inattention as the result of diffuse and diverse funding sources, especially access to airports and waterports. These access issues should not be ignored simply because they are on the fringes of responsibility for the various agencies.

• • • • •

RECOMMENDATIONS TO CONGRESS

1. Address intermodal access by requiring that access to ports, airports and related facilities be a factor in the designation of facilities on the Highway System of National Significance.
2. Stipulate that a given percentage of trust funds for highway, transit and aviation be available, at the discretion of the state and local entities, for joint funding of intermodal transportation facilities.
3. For purposes of reauthorizing a national transportation program, create a Congressional process that encourages inter-committee cooperation and leads to a connected, intermodal transportation program.

---

[21] *See Planning recommendations, page 26.*

Program Efficiencies

The states have become highly sophisticated in engineering and regulatory compliance since the advent of the Interstate program in 1956. The mission of the Federal Highway Administration to foster professional development in state transportation departments has been successfully accomplished. National design standards and engineering procedures for safety, bridge, and pavement design, traffic capacity, hydraulics, and the many other engineering and compliance aspects of highway design are systematically adopted by states on an ongoing basis and integrated into state policy and procedures.

MANY EXISTING PROGRAM CONTROLS AND REQUIREMENTS COULD BE MODIFIED TO REDUCE OVERHEAD COSTS

• • • • •

Due to the continuing expansion of regulatory controls, project costs are significantly escalated by unnecessary federal involvement and excessive requirements for documentation of state decisions and procedures. The efficiency of project development and construction is further impaired by the redundancy of certain US DOT regulations that deal with assuring compliance with the regulations of other agencies. As a consequence of these conditions, specific areas of agency regulations should undergo Congressional review.

California recognizes the essential role played by the US DOT and urges it remain responsible for ensuring the effective use of federal transportation resources. Nevertheless, we believe that many of the controls and procedures developed under existing programs can be modified to reduce program and administrative costs.

• • • • •

RECOMMENDATIONS TO CONGRESS

1. Conduct hearings to specifically address issues related to US DOT seemingly excessive procedures, processes, and regulations including those examples enumerated in Appendix E
2. As indicated from the hearings enact changes that will improve program and administrative efficiencies

TRANSPORTATION SAFETY

Federal, state and local highway safety programs and resources have effectively reduced the national fatality rate over the past twenty years from 5.2 deaths per 100 million miles of travel to 2.4 deaths per 100 million miles of travel. It is projected that by the year 2000, there will be 80,000 motor vehicle related fatalities a year, compared to the current level of 46,000 a year. The fatality rate will have to be reduced to 1.4 deaths per 100 million miles of travel just to maintain a level of 46,000 deaths a year. New, innovative transportation safety programs will be needed to prevent an unacceptable level of fatalities in the future.

Safety considerations should be an integral part of every aspect of the new national transportation program, including efforts to promote safety improvements in vehicles and roadway operations. Driver safety must be enhanced through education and enforcement of laws such as the minimum drinking age, driving under the influence of alcohol and drugs, seat belt use, and commercial drivers licensing. Greater attention is also needed on programs to reduce the number of accidents involving hazardous materials transport.

Transportation safety can best be addressed by driver-oriented programs and roadway-oriented programs. Both the proposed HSNS and FAST-Highways programs fulfill the need for a roadway-oriented program by emphasizing safety as one of several Congressionally established objectives and performance measurements for the highway system.

To address the driver-oriented programs, the current federal highway safety programs (including but not limited to: 23 USC Sections 402, 408, 410, Motor Carrier Safety Program, and Commercial Drivers' License Program) should be restructured into a driver performance grant program. This would not only reduce the need for separate program authorizations, but would minimize program application requirements and red tape. Increased program flexibility and coordination between commercial motor vehicle and non-commercial motor vehicle highway safety would result.

Funding for the driver performance grant program should be set at a rate indexed to the number of drivers or VMT and funded from the Highway Trust Fund. The funds should be administered by the Governor's Highway Safety Representative who would continue to work cooperatively with local governments and private organizations to implement comprehensive safety programs at the state and sub-state level.

Any such program should include incentives (in the driver performance grant program) for occupant protection, drunk driving enforcement, speed enforcement, and for establishment of uniform accident and fatality data collection and analysis. The Congress should reward states that strengthen their enforcement programs or take steps to make their data collection standards conform to the national model.

CURRENT DRIVER SAFETY PROGRAMS SHOULD BE CONSOLIDATED INTO A SINGLE DRIVER GRANT PROGRAM.

ACCOUNTABILITY

Each state must be accountable to Congress for the results of expenditures of funds for the driver performance grant program. Therefore, every three years, each state's traffic safety office would be required to prepare and submit a safety report to the US DOT. The US DOT would be required to consolidate all fifty reports and transmit summary findings and recommendations to Congress.

Congress, for its part, would establish broad national traffic safety goals and objectives. The US DOT would be responsible for developing in conjunction with states, local jurisdictions and private sector interests, the specific performance thresholds beyond which a state's construction funds would be at risk. These performance thresholds should be defined in terms of fatalities and personal injuries. In addition, Congress should request Transportation Research Board

38-253 O—91——81

(TRB), in conjunction with the National Highway Transportation Safety Agency (NHTSA), to develop a recommended uniform data collection and reporting system.

Under this concept, a state's fatal accident rate would be projected based on historical state and national trends. A minimum of five (5) years worth of historical data would be used to develop accident trends. Variability would be accounted for by establishing a range around the projected accident rate, ie., a performance threshold. Differences among states would be accommodated by establishing acceptable accident rates based on individual state's accident trends.

After accounting for statistical variability, if a particular state's performance threshold is exceeded, then federal highway construction funds could be transferred to non-construction safety programs in that state. The amount of transferred funds would depend on the size of the state. The NHTSA would be available for technical assistance should a state decide to request their help in improving highway safety.

• • • • •

RECOMMENDATIONS TO CONGRESS

1. Consolidate the current federal highway safety programs into a single driver performance grant program which would reduce the need for separate program authorizations, minimize program application requirements and red tape, and increase program flexibility.
2. Use incentive funding within the driver performance grant program to reward states for strengthening their enforcement programs and for taking steps to make their data collection process conform to the national model.
3. Index and annually adjust funding for the driver performance grant program based on growth in the number of drivers and or in VMT.
4. Establish national traffic safety goals and objectives and mandate that the US DOT work in cooperation with states, local jurisdictions and private sector interest, to develop performance thresholds for each state.
5. Require each state to report their state's accident rate versus its performance threshold to the US DOT. A state's inability to remain within the performance thresholds could as an example, trigger a transfer of a specified amount of that state's highway construction funding to the driver performance grant program to encourage accident reduction.
6. Request that the Transportation Research Board in conjunction with NHTSA, develop a recommended uniform data collection and reporting system.

Federal Funding

One of the keystones of the federal transportation program has been a stable funding source provided largely by highway users. Since the creation of the trust fund, user fees have financed the construction of this nation's transportation network. In recent years the stability of the trust found has been brought into question.

California believes that a restructured transportation program must be complemented by financing policy that maximizes the effectiveness of current highway trust fund receipts by dedicating user fee revenues solely to transportation needs and making them available to the states at full authorized levels. California's recommendations for complementary financial policies follows:

Driven by deficit reduction concerns, various interest groups have sought to divert transportation user fees to non-transportation related uses. For the same reason, transportation funding capacities have been artificially capped by the Administration. The decrease in transportation funding available through normal channels has placed increased pressure on Congress to earmark funds for special projects. Special tax exemptions for alternative fuels, and even fuel tax evasion further cut the availability of funds. Finally, and most oppressive, is the threat of new federal fuel taxes for general federal deficit reduction.

STEPS SHOULD BE TAKEN TO REDUCE THE IMPACT OF THE ALTERNATIVE FUELS EXEMPTION.

Meanwhile, the existing transportation tax structure and rates are producing revenue inadequate to support an expanded national transportation program at all levels of government. These conditions collectively have reduced the overall effectiveness of the pay-as-you-go tax structure. Steps are needed to return lost revenues to the Highway Trust Fund and Mass Transit Account and to thereby make available all intended revenues for their congressionally unfunded transportation purposes.

A SUBSTITUTE FOR ALTERNATIVE FUELS MAY BE A NEW HEATED CATALYTIC CONVERTER.

Full application of the transportation tax structure can provide adequate funding for an increased transportation program through at least federal fiscal year 1993. Actions which would strengthen the integrity and effectiveness of the highway trust fund include:

REASSESSMENT OF THE ALTERNATIVE FUELS EXEMPTION

The alternative fuels exemption annually diverts a minimum of $600 million from the Highway Trust Fund. This subsidy, intended to encourage the production and use of cleaner fuels, raises questions about the continuation of a user fee concept for highway transportation funded through the National Highway Trust Fund.

Among the ways in which these differing interests of promoting the use of alternative fuels and continuing the user fee concept can be reconciled are:

1. Providing the subsidy through the general fund;
2. Requiring that alternative fuel be taxed at a reduced level, or
3. Combining a partial general fund subsidy with a reduced user tax.

If the present alternative fuels exemption is retained and the use of alternative fuels is mandated to meet air quality objectives, the flow of gasoline excise taxes into the current federal aid financing structure will decrease.

New technology may obviate the need for alternative fuel subsidies. Research by the California Air Resources Board[22] shows a new electric-heated catalytic converter cuts pollutants from gasoline-powered automobiles by as much as 90% in tests and has the potential to be as effective in reducing all pollution as currently used alternative fuels.

If increases in alternative fuels use are mandated for clean air purposes, the original justification for exemptions for alternative fuels will no longer be valid. Mandated alternative fuels should be fully taxed. Congress should avoid any temptation to eliminate the alternative fuels exemption and use the revenues for deficit reduction purposes.

22 As reported in Technical Support Document #xx, California Air Resources Board, May 1990.

ACCELERATION OF EFFORTS TO COLLECT ALL MOTOR FUEL TAXES DUE

Nationally, motor fuel tax evasion, especially with respect to diesel fuel taxes, is an ongoing problem. Although Congress now mandates collection of diesel fuel taxes at the wholesale level, corporate scams and abuse by multiuse consumers still abound. Specific areas of concern over misuse/evasion include use of oil sold for heating purposes being used as a motor fuel and fuel sold for off-road purposes being used on public roadways.

Congress needs to adopt more stringent penalties for motor fuel tax evasion. Congress must ensure that motor fuel taxes paid by highway users are accurately reflected in revenues deposited in the Highway Trust Fund. Additionally, Congress should direct the Transportation Research Board, working through the Secretary of Transportation (in cooperation with the Internal Revenue Service), to explore and report on ways to help assure that diesel fuels sold for non-highway purposes are easily identified, both prior to and after usage.

DEDICATION OF ALL FUEL TAX FOR TRANSPORTATION PURPOSES ONLY

The Highway Trust Fund balance should not be used as an offsetting credit that masks the true level of the federal deficit. We urge the gradual spend down of trust fund balances for transportation purposes only. In addition, we urge that the trust fund be removed form the calculation of Gramm-Rudmann-Hollings targets. The recent proposal to take action with the Social Security trust fund, argues compellingly for similar treatment for the highway, transit, and aviation trust funds.

Recent analyses estimate the 20 year costs of adequately maintaining and augmenting the nation's transportation infrastructure and services to be in the heady range of $1-3 trillion. The federal government should be a steady, reliable and significant partner in helping to meet those needs. However, even if federal contributions are substantially increased, state, local, and private sector investments will be required to rise so as to better meet total needs. However, it is likely that the proportion of transportation needs funded at the state and local level will continue to grow. This shift of financial responsibility further argues for greater program discretion at the state and local levels.

• • • • •

RECOMMENDATIONS TO CONGRESS

1. Make permanent the Highway Trust Fund and gradually eliminate obligation limits by $1.5 billion per year.
2. Take decisive action to reduce the extent to which tax evasion is "stealing" from the Highway Trust Fund.
3. Mandate the use of alternative fuels in air quality non-attainment areas, and discontinue the special fuels tax exemption or shift subsidies to the general fund.
4. Direct the Transportation Research Board to study and to report to the Congress on ways to better ensure that diesel fuel sold for non-highway purposes is not used on the nation's roadways.

THE EFFECTIVENESS OF CURRENT HIGHWAY TRUST FUND RECEIPTS SHOULD BE MAXIMIZED BY DEDICATING USER FEES FOR TRANSPORTATION SOLELY.

• • • • •

TRANSITION FROM THE OLD TO THE NEW

Heading into the 1990s, there will be a variety of important matters to consider in the transition from the current still incomplete, federal highway program and its many categories to a new, more relevant, and streamlined federal program. Special cooperative federal and state study teams should be organized to define specific and workable solutions to the major transition issues.

TRANSITION ISSUES

A FINANCIAL PLAN FOR COMPLETION OF THE INTERSTATE IS NEEDED.

Establishing a financial plan for the prompt funding and completion of the remaining Interstate Highway and Interstate substitution commitments should be a key feature of the transition process. It appears that in addition to authorizations already made, approximately $4 billion in additional funding will be needed to fully finance the projects as defined in the 1991 Interstate cost estimate. Congress should approve one final cost estimate to fulfill the long standing commitment to complete the Interstate system including Interstate Substitute Projects. The authorizations and distributions required to meet this commitment should be spread over the life of the next surface transportation assistance act (or over a four year period, which ever is greater), in accordance with a state by state obligation plan coordinated through the US DOT. Transition authorizations should be in addition to a state's normal highway program allocations. Funding for the Interstate completion program would come from Trust Fund reserves.

Issues associated with the carryover apportionment balances that states have accumulated, but have been unable to use due to annual obligation limits must be addressed. Past highway reauthorization bills have largely ignored carryover balances — except to determine how much extra revenue is needed to ensure that these carryover balances do not trigger trust fund anti-deficit provisions.

The most simple, direct and effective method for resolving transition issues is to make permanent the Federal Highway Trust Fund, and remove the obligation limits. With a permanent highway trust fund and an end to obligation limits, states would be free to obligate their carryover apportionments as rapidly or as slowly as they chose, and without any further budget restrictions or the need for additional Congressional action.

RECOMMENDATIONS TO CONGRESS

1. Approve one final cost estimate to fulfill the long standing commitment to complete the Interstate System (as defined in the 1991 Interstate Cost Estimate) and Interstate Substitute Projects. Spread the authorizations and distributions over the life of the next Surface Transportation Assistance Act (or over a four year period, whichever is greater) in accordance with a state by state obligation plan coordinated through the US DOT.

Appendix A: Goals, Objectives And Performance Measures For The Highway System of National Significance

I. GOAL: Improve national and international commerce.

Objective: Establish major national truck routes that provide ready access to significant economic centers.

Performance Measure: Targeted increases in annual tonnage carried by the HSNS statewide.

Objective: Improve access to major intermodal facilities.

Performance Measure: Increases in intermodal volume/decreases in through truck traffic on the HSNS.

II. GOAL: Improve the efficiency of the existing urban HSNS segments.

Objective: Increase mobility and reduce delay.

Performance Measures: Reductions in average time required to travel X miles (e.g., 10 miles); number of person miles traveled; number of lane miles operating above the previous year's Level of Service (LOS); units of energy per passenger mile; etc..

III. GOAL: Preserve air quality while maintaining transportation's contribution to the economy.

Objective: Reduce mobile emissions.

Performance Measure: Reductions in the total annual number of non-attainment days and number of designated carbon monoxide (CO) "hot spots" resulting from mobile emissions in relation to volume of passenger and freight handled in the corridor.

IV. GOAL: Preserve the federal investment in the HSNS.

Objective: Maintain the physical integrity of all HSNS facilities.

Performance Measures: Improvement in the Present Serviceability Rating [PSR] as determined by random samples of the HSNS reviewed through periodic post audits.

V. GOAL: Improve the safety of the traveling public on the national highway system.

Objective: Improve HSNS roadway and driver safety.

Performance Measures: Reductions in the number of fatalities and personal injuries per unit of passenger miles traveled.

VI. GOAL: Provide a highway network that meets national defense needs.

Objective: Apply necessary geometrics and adequate load carrying capacity standards (STRAHNET) to provide full access for defense purposes.

Performance Measure: Increases in the number of lane miles raised to meet STRAHNET geometric and weight requirements.

VII. GOAL: Apply uniform national design standards to all facilities in the HSNS.

Objective: Raise all substandard facilities, where possible, to national standards.

Performance Measures: Increases in the number of lane miles and bridges raised to higher standards.

Appendix B: Goals, Objectives and Performance Measures for the FAST-Highways System

I. GOAL: Improve intrastate and interregional commerce.

Objective: Establish major regional truck routes for access to economic centers.

Performance Measure: Reduce the travel time for trucks using the statewide FAST system.

Objective: Improve access to major intermodal facilities.

Performance Measure: Completion of projects undertaken to improve access to and from intermodal facilities or create new intermodal facilities.

II. GOAL: Improve the efficiency of the existing state and local system.

Objective: Increase mobility and reduce delay.

Performance Measures: Reductions in average time required to travel X miles (e.g., 10 miles); number of person miles traveled; number of lane miles operating above the previous year's Level of Service (LOS); units of energy per passenger mile; etc..

III. GOAL: Preserve air quality while recognizing transportation's contribution to the economy.

Objective: Reduce mobile emissions.

Performance Measure: Reductions in the total annual number of non-attainment days and number of designated Carbon Monoxide (CO) "hot spots" resulting from mobile emissions.

IV. GOAL: Preserve the public investment in the state and local highway system.

Objective: Maintain the physical integrity of the FAST facilities.

Performance Measures: Improvement in the Present Serviceability Rating (PSR) as determined by random samples of the FAST system reviewed through periodic post-audits.

V. GOAL: Improve the safety of the traveling public on the FAST system.

Objective: Improve roadway and driver safety.

Performance Measures: Reduction in the number of fatalities and personal injuries per unit of vehicle miles traveled.

VI. GOAL: Apply state designated design standards to all facilities in the FAST system.

Objective: Raise all substandard facilities to standards, where possible.

Performance Measures: Increases in the number of lane miles and bridges per year raised to standards.

VII. GOAL: Improve road access to rural and urban economic activity centers.

Objective: Increase truck access to and from the HSNS over the FAST system.

Performance Measure: Increases in the number of lane miles statewide brought up to STAA vehicle access standards.

COMPARISON OF THE CATEGORIES OF SELECTED FEDERALLY AIDED PROJECTS AND PROPOSED FAST-HIGHWAYS PERFORMANCE CRITERIA

Improve Access to Major Intermodal Facilities	Increase Mobility and Reduce Delay	Reduce Mobile Emissions	Maintain the Physical Integrity of the FAST System	Improve Roadway and Driver Safety	Raise All Substandard Facilities to Standards Where Possible	Increase Truck Access To and From the HSNS Over the FAST System

Appendix C: Goals, Objectives and Performance Measures for the TSNS

I. GOAL: Improve the efficiency of the existing National Transportation System.

Objective: Increase mobility and reduce delay.

Performance Measure: Reduction in the number of SOVs using congested corridors.

II. GOAL: Preserve air quality while recognizing transportation's contribution to the economy.

Objective: Reduce mobile emissions.

Performance Measure: Lowering of NOx and CO emissions at major hot spots.

III. GOAL: Preserve the federal investment in the existing transit systems.

Objective: Maintain the physical integrity of all transit facilities.

Performance Measure: Adoption/Implementation of long term preventive maintenance programs.

IV. GOAL: Improve the safety of the traveling public on transit systems.

Objective: Improve facilities and driver safety.

Performance Measure: Adoption/Implementation of systems-wide safety plans.

V. GOAL: Provide accessibility and mobility for all citizens.

Objective: Increased access for older persons, persons with disabilities, and rural communities.

Performance Measure: Identification/implementation of projects/facilities that improve access for transit projects.

Appendix D: Goals, Objectives, and Performance Measures for the FAST-Transit Program

I. GOAL: Improve intrastate and interregional commerce.

Objective: Provide major regional commuter access to economic centers.

Performance Measure: Introduction of HOV lanes, rail transit etc. in HSNS corridors.

Objective: Improve access to major intermodal facilities.

Performance Measure: Additional park and ride transfer stations.

II. GOAL: Improve the efficiency of the existing state and local system.

Objective: Increase mobility and reduce delay.

Performance Measure: Establishment of Vanpool Programs in major employment centers.

III. GOAL: Preserve air quality while recognizing transportation's contribution to the economy.

Objective: Reduce mobile emissions by reducing vehicle miles traveled and increasing person miles traveled.

Performance Measure: Establish congestion pricing on corridors where substantial transit service is available.

IV. GOAL: Preserve the public investment in the state and local transit systems.

Objective: Maintain the physical integrity of the facilities.

Performance Measure: Implementation of long term preventive maintenance plans/improvements in repair facilities.

V. GOAL: Improve the safety of the traveling public on the FAST system.

Objective: Improve equipment and driver safety.

Performance Measure: Implementation of drug testing programs.

VI. GOAL: Improve transit access to rural and urban economic activity centers.

Objective: Increase transit access to and from the HSNS over the FAST system.

Performance Measure: Support for local bus/taxi services to major interregional travel hubs (ie., intercity bus/rail stations, airports).

RECOMMENDATIONS TO CONGRESS:

1. Extend the current "pay-back" deadline for preliminary engineering funds on those projects which have not advanced to right of way acquisition or construction to 10 years, making it the same as the current federal pay-back requirement for right of way acquisition.
2. Return to the states sole discretion for requiring alternate designing of major bridges.
3. Amend Title 23 to give states sole discretion for highway project design approval and construction authorization approval for pavement replacement or overlay projects, and base and resurfacing projects that include minor widening. Approval should include, but not be limited to, such elements as pavement design or pavement rehabilitation, bridge widening, bridge rail, guardrail, fill slopes and clear zones.
4. Eliminate the required submission of a statewide program of projects under 23 USC 105 and the State Transportation Improvement Program (STIP) be allowed to take its place.
5. Designate that the Secretary of the US DOT work with the Mine Enforcement Safety Administration to rescind their regulations pertaining to temporary, small scale crushing and screening operations.
6. Give states the authority to establish their own maintenance standards, since they are subject to tort liability actions in relation to federal standards and the maintenance thereof. As an alternate, Congress could prohibit the use of federal standards in state tort liability cases.
7. Amend Title 23 to provide that if a state obtains Federal Emergency Management Agency (FEMA) compliance approval for FEMA floodplain regulations for a highway project, FHWA floodplains regulations shall not apply.
8. Amend Title 23, Section 125, to increase the participation rate for emergency relief work under the federal-aid sliding scale rates.
9. Amend 23 CFR, Chapter 810, to delegate all HOV lane determinations to states with adopted HOV system plans.
10. Amend existing law to allow US DOT to use a certification acceptance process, where substantive state laws, regulations, and procedures exist pertaining to wetlands, floodplains, and endangered species. Wetlands should be defined to exclude surface expressions of water related to man-caused sources that are dependent on economic viability for continued existence. Wetlands should define both quality and quantity of surface expressions of water and plant life. Intermittent (less than six months of duration) areas should not be included.

RECOMMENDATIONS TO US DOT:

1. Delegate the responsibility for compliance with 3R project standards to the states on a certification acceptance basis, including environmental clearance and right of way certification for local projects delegated to the states. FHWA certification acceptance would be granted for all "federal share payable" projects if requested by the state.
2. Amend its definition of "major contract change order types" (requiring written approval) to account for the cost or substantive issues involved with the change, and require compliance only for those changes which are actually major.
3. Delegate to the states the responsibility for the number of solicitations and notices mailed, the listing of contractors, the documentation of procedures, and the evaluation of contractor's expertise.
4. Eliminate its requirement for separate project recordkeeping on pay items common to multiple projects under a single contract. The states should be allowed to use plan sheet quantities for proportioning construction

pay-item units among the projects under one contract.

5. FHWA Regional Offices would delegate review of project and environmental documents to the FHWA Division Office. The Division Administrator would be required to delegate the review of legal sufficiency on non-sensitive projects to the state DOT based upon a showing by the state that it has acceptable procedures.
6. Amend F.H.P.M. 6-6-3-1 (23 CFR PART 645, Subpart A) to eliminate requirements for special FHWA authorization to relocate utilities, and the requirement that all utility agreements must have federal approval.
7. Amend F.H.P.M. 6-4-2-1 (23 CFR PART 635, Subpart C) to eliminate requirement of a detailed right of way certification with the PS&E submittal and substitute a short summary of the status of the right of way plans, certification acceptance, and post-audit.
8. Amend 49 USC Section 303 to ensure that it applies only to "significant use" and define use to mean the physical taking of property. The respective park authority should be able to determine if the impact is significant and such determination should prevail as the controlling 4(f) determination.

Appendix F — HSNS Program Formula, FAST-Highways Program Allocations and Example Allocation Tables

In the early 1990's, as we enter the post-Interstate construction era, the traditional national highway programs will need to be reshaped to respond to the "new transportation concepts for a new century." If the recommendations of AASHTO, the US DOT, the Highway Users Federation, and other associations are heeded, the hodgepodge of current federal programs must be replaced with new formulas that fit the new federal program design.

The current formulas may have worked in times past, but they clearly are out of step with the 21st century. New formulas must be created. There is no choice if the old federal programs are to be reshaped to handle new and demanding challenges.

The following assumptions were used in developing a highway program formula that would obtain the most desirable results.

Assumptions:

1. The total federal funds would be split 50-50 between the HSNS and FAST programs.
2. The half-percent guarantee is applied to the HSNS program, but not the FAST-Highways Program.
3. An 85% minimum allocation guarantee for the HSNS program is continued.
4. A flexible hold-harmless is established in the HSNS program. After adjustments for interstate completion and discretionary/demonstration funding, all states would receive no fewer federal dollars than they did in 1991.
5. As federal funding increases above 1991 levels, the hold-harmless base should be increased at an equitable percentage growth rate.
6. Total statewide urban and rural lane miles and total statewide urban and rural vehicle miles of travel are used as principal allocation factors, and separate calculations for urban and rural factors for each in the formula.
7. The formula provides a one-third weight for mileage and VMT factors — that is one-third to recognize the extensiveness of the system and one-third to recognize the usage intensiveness. Because urban costs for the national system would be more than twice as much as the rural costs, the formula gives weight on a two to one, urban to rural ratio.
8. Because the national system is intended to support interstate and international commerce, and because of the wear and tear of heavy trucks on roads and bridges, the formula uses a factor associated with heavy truck travel to comprise the final one-third. Diesel fuel sales provide an acceptable surrogate for accurate state-by-state data on truck mileage and weight and therefore should be used as the heavy truck travel allocation factor.
9. Large area, small population states (states with a population level of 25 or fewer persons per square mile) are provided a supplement to their HSNS allocations to guarantee that th will have sufficient funds for their HSNS routes. The supplement should be inversely related to population density: one person per square mile equal to 25% supplement and 25 persons per square mile equal to 0% supplement.

Figures 1 and 2 explain the distribution of the Highway Trust Fund and the HSNS and FAST-Highways Program formulas. The tables following show state-by-state funding that the formula produces, at a $13.5 billion federal funding level, with about $1 billion reserved for emergency relief, federal lands, discretionary bridge, and other off-the-top programs. Table 2 shows the detail of HSNS program allocations under the proposed formula. Table 3 shows the composite results of the total federal formula funding for basic programs. Table 1 shows the Low Population Density Supplements.

Regardless of the formula factors that are ultimately selected by Congress, US DOT and the states will need to work together to upgrade the data base to more explicitly identify lane miles to make certain the VMT is calculated on a consistent basis among the states and to seek to design an explicit truck travel data base.

FIGURE 1 — HIGHWAY PROGRAM ALLOCATIONS FLOW CHART

Figure 2 — Calculating The Highway Program Allocations

STEP 1

Congress authorizes the total annual highway program amount. Adjustments are made for the usual program takedowns (e.g., US DOT administrative costs, emergency relief, etc.). The remaining authorized program is divided 50% HSNS and 50% FAST.

STEP 2

a. HSNS Formula — The VMT, Diesel Consumption, Lane Miles data is calculated.

b. FAST Formula — Each state's proportionate percentage contributions to the Highway Trust Fund is calculated and applied to the 50% FAST-Highways Program authorization.

STEP 3

The HSNS Formula is applied to its 50% authorization. The formula results are analyzed to determine if the 85% and Hold Harmless guarantees have been met. Adjustments are made if necessary utilizing dollars in the Highway Trust Fund Reserves.

STEP 4

Population density supplements are calculated and added for those states with 25 or less persons per square mile.

STEP 5

Each state receives its HSNS program allocation and its FAST-Highways Program allocation.

STEP 6

Each state can now exercise its option to transfer up to 20% of its total apportionment to either program. Each state according to its own process, allocates the appropriate amount to the non-state systems from its FAST-Highways Program allocation.

Table 1 — Low Population Density Supplement

LOW POPULATION DENSITY SUPPLEMENT (in millions)

State	Low Pop. Density Supplement	Total HSNS Allocation
Alaska	$3.91	$16.96
Idaho	$6.72	$40.31
Montana	$9.23	$46.16
Nebraska	$5.92	$65.10

SUBCOMMITTEE ON SURFACE TRANSPORTATION

Reauthorization of the Post-Interstate Surface Transportation Programs

Chairman Mineta and Members of the Committee, My name is **Terry O. Cooper**. I am the **Director of Transportation for the City of Fresno, and the Fresno Area Express (FAX) in Fresno, California**. I appreciate this opportunity to testify before the Subcommittee today on the federal reauthorization program as it relates to our transit system. I would also like to speak on behalf of the principles which members of the American Public Transit Association (APTA) are seeking to have included in the upcoming Reauthorization of the Surface Transportation Program. I am currently the **Vice President of Government Affairs for APTA**.

The principles adopted by APTA's membership are particularly relevant to the difficulties we face in the City of Fresno, the San Joaquin Valley and the State of California. Small and medium sized systems throughout the nation are facing an evergrowing demand for additional transportation services far beyond their capability to provide them. We are all keenly aware of the needs of the large metropolitan areas which face seemingly insurmountable challenges to answering their transportation problems. **The common element which exists at all levels is the need for continued and increased federal transportation programs.**

The reauthorization process coincides with the crisis in American transportation nationwide. The demand for additional capacity is growing relentlessly at the same time the requirements to deal with the negative impacts of traffic congestion, lost productivity, air pollution and other environmental problems are growing at an equally incredible rate. In Fresno, Fresno County and the entire San Joaquin Valley we have one of the worst air pollution problems in the nation as carbon monoxide emissions from on-road vehicles currently constitute 65.1% of our local and regional smog problem (see attachment). How government and private interest at every level respond to these problems will make the difference between success and failure in fostering economic growth, cleaning up our air and ensuring high quality of life for all our citizens over the next decade and into the twenty first century.

To deal with this crisis, **public transit must become a central feature of the nation's transportation infrastructure**. In reauthorizing the Federal Surface Transportation Programs, your committee can revitalize the federal government's partnership with state and local governments. Future transit and highway needs require a comprehensive financial strategy guided by increased federal involvement. Federal involvement is the key to achieving national goals and ensuring participation from all state and local governments.

In 1986, the City of Fresno and Fresno County along with Alameda County, modeling a local Santa Clara County proposition; enacted a local, transportation specific, sales tax to address their growing transportation needs.

To date, some 16 California counties have enacted transportation specific sales taxes. Most recently, as you are well aware, the State of California passed Propositions 108, 111 and 116 which shows that Californians understand the important issue transportation and the priority of paying for transportation versus not paying.

To invest in transportation rather than letting the bills mount up for pollution, congestion, decaying highways, lower quality of life, and lost opportunities for economic growth has clearly been demonstrated in the nation's most populous state.

We urge the federal government to recognize the particular importance which has been demonstrated here that people are willing to pay specific taxes for specific benefits such as transportation. To further recognize that federal government's role which has invested billions of tax dollars into major transportation systems over the last thirty years cannot logically be reduced and in fact must be increased to meet our future demands and requirements for additional services.

Growth estimates for the Fresno Clovis Metropolitan Area over the next 25 years or by the year 2015 are projected to increase by more than 64% from 435,000 to 714,000 people. The ability to deal with the anticipated growth is further complicated by the mandated requirements for accessibility and alternative fuel operations which will soon be enacted. Specifically, assuming an annual operating budget of $15.3 million the needs and compliance requirements for FAX over the next 5 years will be as follows:

1. **Capital Equipment -**
   Replacements for 13 - 15 year old buses = **$10.7 Million**

2. **Service Demands -**
   More service in the evenings, greater frequencies, more express type = **$19.3 Million**

3. **Compliance Requirements -**
   Alternative fuels will increase our annual budget by $1 million per year, or more than **$4.3 million** over the next 5 years.

4. **Full compliance with ADA** will also add to our costs significantly during the same time period.

To meet these demands at a time when existing transit facilities are in desperate need of upgrading primarily caused by the reduction of federal assistance over the last 10 years of more than 50%, is simply impossible.

How long can we continue to ask public transit to do more in the areas of congestion relief, enhance mobility, air pollution reduction, land development improvements, infrastructure needs, economic health and reduced dependence on foreign oil if we do not continue, let alone increase our investment in such facilities to meet these needs.

Increased public transit use must clearly become an important part of a successful national program to meet these challenges. Only transit can simultaneously reduce pollution, congestion and fuel consumption while ensuring mobility for more people in accommodating increased passenger miles of travel.

On behalf of the City of Fresno, small and large transit systems throughout the country and the American Public Transit Association as a whole, we urge the committee to support a national goal of increased transit availability and ridership which will be necessary to fund through increased federal assistance as described in the following points:

1) A federal investment in public transit should be increased to at least 11 billion dollars annually, $6.5 billion for essential reinvestment and $4.5 billion for capacity expansion.

2) To provide reliable, predicable funding it will be necessary to enact a 7 cent per gallon increase in the federal fuel excise tax earmarked for transit.

3) The federal government should provide transit systems with additional aid to pay for compliance with federally mandated clean air and accessibility requirements.

4) Metropolitan areas should have greater flexibility in the use of federal transportation funds to meet more specific local transportation needs.

5) The definition of transit should be broadened to include a wide range of high occupancy vehicles and shared ride services.

6) The federal government should eliminate tax policies that discourage transit use and private investment in transit facilities.

In conclusion, by incorporating these principles into the Surface Transportation Reauthorization legislation, your committee can reassert the proper federal responsibilities by ensuring that transportation policies achieve national goals while maintaining an appropriate area, state and local control over planning and implementation. Many local and state governments throughout the country have already absorbed a large portion of the federal reduction in transportation investments but may be stretched to the limit in their abilities to meet future needs.

Mr. Chairman, I would like to thank you for the opportunity to present testimony to your Committee and we look forward to working with you towards an aggressive, long-term, fiscally responsible solution to meeting our ongoing transportation needs in this country.

CALIFORNIA AIR BASINS

A.R.B. 7/86

ADOPTED PRINCIPLES FOR THE REAUTHORIZATION OF THE SURFACE TRANSPORTATION ASSISTANCE ACT

PRINCIPLE 1

The federal investment in surface transportation should be substantially increased and, with these increases, parts of the federal program should be substantially restructured.

PRINCIPLE 2

In order to accommodate a diversity of passenger travel while reducing growth in vehicle miles, the definition of transit and the UMTA charter should be broadened to encompass and promote increased availability and use of transit and all forms of high-occupancy, shared-ride services.

PRINCIPLE 3

Allow greater flexibility in the use of available federal funds; enhance and strengthen the existing regional decision-making authority over the use of federal transportation funds.

PRINCIPLE 4

Establish a stronger multi-modal approach in planning, funding and decision-making.

PRINCIPLE 5

Reliability and predictability of federal funding should be improved through greater reliance on dedicated funding. The costs associated with mandated federal actions, and the substantial contribution of transit to the achievement of other national goals, provide justification for increased support from all sources.

PRINCIPLE 6

Increase reliance on a predictable formula funding using factors better reflecting transit needs.

PRINCIPLE 7

Substantial additional funding should be provided for transit to fully carry out the national goal of significantly increasing the provision and use of high-occupancy, shared-ride services.

PRINCIPLE 8

An immediate motor fuels tax increase should be enacted, and the entire federal fuels tax made permanent concurrent with reauthorization of the Surface Transportation Assistance Act, to support needed transit and highway investment.

PRINCIPLE 9

The federal transportation program and Tax Code should be revised to encourage private investment in transit, and to eliminate the taxation of employer-subsidized transit passes and other federal laws which act as disincentives to transit use.

PRINCIPLE 10

Federal transportation policies and programs should require closer integration of transportation investments and land use decisions, in order to provide an environment that is conducive to and encourages increased provision and use of high-occupancy shared-ride services. Other federal policies should incorporate the same objective.

PRINCIPLE 11

Expand federal support for basic research, development, training, and human resources activities affecting transit, and ensure adequate direction of the program by transit industry officials.

PRINCIPLE 12

Federal operating assistance for all sizes of transit systems is an essential element of the federal program and must continue in order to assure adequate maintenance and effective operation of the transit capital investment.

PRINCIPLE 13

Federal policies and mandates result in additional costs to transit operations and capital investments and, as such, federal funding should be provided to meet these requirements.

Mr. Chairman and Members of the Subcommittee, my name is Lawrence D. Dahms. I am Executive Director of the Metropolitan Transportation Commission, the Bay Region's transportation planning and finance agency. I am appearing before you today as Chair of the Bay Area's Transit Operator Coordinating Council, which is composed of the general managers of each of the region's major transit systems. Taken as a group, the Bay Area's transit network serves over 1.5 million people each weekday and has an annual operating budget of $750 million. Appearing with me today on behalf of the Transit Operator Coordinating Council are Frank Wilson, General Manager of BART; Carney Campion, General Manager of the Golden Gate Bridge Highway and Transportation district; Howard Goode, Management/Analyst of the San Mateo County Transit District; Ken Stanley, Planning Director of the Alameda-Contra Costa Transit District; Ed Harrington of the City and County of San Francisco; and Jim Reading, General Manager of Santa Clara County Transit.

We are happy to appear before you today to present a regional perspective on the reauthorization of the nation's surface transportation program and to address some of the key transportation issues facing us here in the Bay Area. At the outset, I would like to stress our support for the reauthorization principles embodied in the T-2000 program developed by the American Public Transit Association (APTA), including APTA's call for an increase in gasoline user fees for public transportation. I have attached APTA's principles to my written testimony. These principles underscore the need for dedicated, stable sources of funding for transit in our nation's cities and clearly state the national interest in both transit operations and capital expansion and rehabilitation.

Note in the APTA principles, as in the testimony of almost every national organization, support for more flexible federal funding.

Before deferring to my transit partners for their remarks, let me explore briefly this concept.

1) Why is flexibility important?

2) How can flexibility be achieved?

3) How can flexibility become inflexible?

Briefly, in that order, consider these answers.

1) Why is flexibility important?

A flexible federal program is essential if other federal objectives are to be given adequate consideration. Land use integration, air quality mitigation, multimodel integration, increased local funding and cost effective project investments are all encouraged if state and local decisions are free of overly rigid federal funding categories and regulations. Often improvements are not feasible unless there is an opportunity for local tradeoffs to be made.

2) How can flexibility be achieved?

We propose a geographic allocation of formula funds dedicated to building and operating metropolitan and rural access systems.

(7538p)

The existing state-local decision process described in federal law provides the basis for determining how planning and funding decisions would be made. With slight modification, this existing law could impose a system discipline while providing sufficient flexibility to encourage the integration of freeways, local arterials, transit and major terminals. Where a well established MPO exists, it could assume a leadership role in the state-local partnership. In other cases, the state could play the leadership role so long as it focused on the metropolitan or rural access system. The federal government has demonstrated its ability to get all states to focus on delivery of a single system - the Interstate. There is every reason to believe that a similar focus on metropolitan and rural access system development can be achieved now. In this case, however, an extended partnership and more flexibility are required.

3) How can flexibility become inflexible?

There are traps to be avoided, as follows:

The move to create a National Highway System of 150,000 miles can lead to State/Federal preoccupation with a single part of the system. While this may have been required to complete the Interstate System, it threatens a meaningful response to congestion in urban areas where a multi-faceted attack is required.

Perpetuation of anti-transit bias manifested in alternatives analysis requirements, differing matching ratios and other regulations directed only at transit acts also to undermine flexibility.

(7538p)

38-253 O—91——82

These federal impediments to flexibility are exaggerated by State Transportation Departments still wedded to a freeway as always the best solution. These impediments must be countered by Congress if we are to benefit from new thinking needed to meet new transportation challenges.

Conclusion

A gap exists between lofty goals expressed in the Secretary's National Transportation Policy and similar statements by our own California Administration versus specific implementation proposals. In this brief examination of the concept of flexibility we suggest that it is a worthy strategy in search of achieving other federal objectives, so long as care is taken to follow through to a logical conclusion.

We appreciate the support your committee can give in matching worthy objectives with strong implementation incentives.

Thank you for this opportunity to discuss these concepts.

(7538p)

MTC Supports APTA's T-2000 Principles

Abstract of the American Public Transit Administration (APTA) Principles

1. Restructure the federal surface transportation program.
2. Broaden the concept of transit to other forms of mobility.
3. Enhance and strengthen regional decision-making authority.
4. Provide flexibility and multimodal decision-making.
5. Increase reliance on dedicated formula funding.
6. Continue federal support from all sources reflecting the cost of federal mandates and transit contribution to national goals.
7. Substantially increase federal funding.
8. Dedicate an immediate fuel tax increase to transit and highway investment.
9. Add federal tax code incentives.
10. Require closer integration of transportation investments and land use decisions.

Discussion

APTA principles take the reauthorization discussion beyond current conventional wisdom as follows:

1. APTA principles embrace the concept of mobility in contrast to its historic modal orientation.
2. APTA principles recognize the potential advantage of highway/transit investment tradeoffs at the regional level.
3. APTA principles support a substantial user fee increase to invest in transportation rather than defend only against a deficit reduction raid.

These APTA principles inject fresh thinking into the reauthorization debate.

HOUSE PUBLIC WORKS TRANSPORTATION COMMITTEE HEARING ON URBAN MASS TRANSIT REAUTHORIZATION BILL

July 5, 1990
San Jose, California

Erlene DeMarcus, Director
Bay Area Rapid Transit District

I am speaking to you today from a local perspective to let you know how important it is for the Federal Government to stay a key part of the funding equation for transit. As Congress continues to write new laws impacting our daily lives it is critical and only fair that these federal policies be tied to funds for implementing them. For instance, an important federal policy currently under discussion is the protection of the environment. Achievment of this goal requires a close connection between transportation and land use. Since we in transit are looked to as a solution to environmental problems, the law should be constructed compatible with funding any needed transportation improvements. Likewise, mobility for the elderly and handicapped is a fundamental federal objective. But where in the law do you find the ability to deliver the necessary transportation services to achieve this purpose. I submit that there must be specific linkages between policy and the execution of that policy in order for the objectives to be met.

Growth in the Bay Area is of major concern. While we do not control that growth, we are often called upon to manage it once it has occurred. Whether we do this well or not so well is dependent on the resources available to us. It would be much preferable if we could be a catalyst to manage growth before it happens rather than after the fact. Transportation decisions become more costly in the latter environment merely because you are more likely to have to subway under the existing development. It would be much cheaper and more reasonable to build before such growth has occurred.

In summary, California is a growth State. We are feeling the pressure of that growth and are doing what we can at a state and local level to respond to that growth. In addition, we ask Congress to understand the diversity of this wonderful country and to not lose sight of the needs of growth areas while trying to deal with the very different needs of our older cities. We need the ability to be able to build for the future.

Thank you for your consideration.

Testimony by Rod Diridon, Chair
Santa Clara County Transit District
Board of Supervisors

to the
House of Representative's
Committee on Public Work's and Transportation
Sub-committee on Surface Transportation

Public Hearing on the
Federal Reauthorization Bill
July 5, 1990

Mr. Chairman, Members of the Committee, as Chairman of the Santa Clara County Transit District Board of Supervisors, I would like to make some brief comments:

First, before I speak specifically on the topic of reauthorization, I would like to take this opportunity to thank Congress, this committee and especially the Chairman, for the past financial support and commitment which made this county's first light rail system possible. The current starter segment revenue service in the Guadalupe Corridor extends nine miles from downtown San Jose, north to the Santa Clara Great America amusement park. The remaining 11-mile south line from downtown San Jose to the residential neighborhoods in South San Jose is currently under construction and scheduled to begin revenue service in the summer of 1991. We are also pleased to inform this Committee that the project is within budget. And as of April, 1990, the initial segment carried in excess of 9000 weekday passengers, greatly surpassing our original ridership projection of 2000 to 5000 weekday riders. This is a strong indication that residents of Santa Clara County view transit as a viable and effective means of transportation.

We hope the same financial support and commitment by congress will continue for the county's proposed second rail project, the Tasman Corridor Extension. The corridor's federal alternatives analysis and draft environmental impact study are in progress. We are nearing the selection of the locally preferred route alternative and will be ready to move forward into the preliminary engineering phase shortly. Congress and the Urban Mass Transportation Administration can play an important role by authorizing a full funding grant agreement on the project within the coming year.

In addition to Santa Clara County's commitment to the Tasman Corridor, the County is also spending substantial amounts of local funds to study future transit corridors. These include the Fremont to San Jose BART Corridor, and Vasona Light Rail Corridor. We also support improvements to the existing CalTrain Corridor and are currently proceeding with plans to extend rail service south to Gilroy. We have also conducted or are in the process of accomplishing preliminary studies of the Route 85, Santa Teresa, Capitol, and Downtown to Evergreen Corridors.

Greater use of mass transit in these key transportation corridors will be the direction of the future. County-wide opinion surveys have shown a strong level of support for rail improvements, particularly as a longer range solution to our traffic congestion and air pollution. The residents of Santa Clara County also expressed their strong support of rail by approving two rail bond programs in the June state-wide elections. Finally, all fifteen of our cities, the county Transportation Advisory Commission and the regional Metropolitan Transportation Commission support this master plan for our transition to transit.

In order to achieve our mass transit goals, a strong federal, state and local funding partnership must continue to be strengthened by increasing funding at all levels. Even though all of the major counties in the San Francisco Bay Area, including Santa Clara County, have elected in recent years to become "self-help" (that is increase the local sales tax for mass transit and roadways), the need for increased federal and state funding assistance for transportation remains high. These local sales tax measures were budgeted to provide the local matching funds to attract the state and federal shares. The local funds are sadly inadequate to do the whole job.

The need for strong federal assistance is especially true in the area of transit -- adequate and dependable levels of federal funds for both operating and capital assistance must be maintained as an essential component of the next reauthorization bill. Just as California has raised taxes for transportation, so should the federal government increase the federal gasoline tax to meet our nation's future transit demands. That position is shared by the American Public Transit Association, the National Association of Counties (of which I am Chair of the Mass Transit and Railroads Committee), League of Cities, and others. Without this assistance, we will be unable to achieve California and federal air quality and congestion reduction goals.

It is important to Santa Clara County and other economic centers that new national policies and programs encourage and support regional planning. In order to engineer Santa Clara County's transportation infrastructure to meet regional goals in air quality, congestion reduction and the integration of land use and transportation services, we will need federal policies that allow local or regional governments to decide where to invest their limited federal, state and local transportation dollars.

This can only occur if maximum flexibility in the application of transportation funds is permitted. As part of the recent California gasoline tax increase package, flexible funding in the form of a flexible congestion relief program was instituted . Under this program, newly generated gasoline tax revenues can now be used for either rail projects or roads, with the decision resting at the local government level. Federal support for these kinds of programs will ensure adequate dollars are available to regions for determining and developing their own unique future transportation systems.

In order to allow this flexibility to work the new reauthorization bill needs to address two important problems associated with project implementation. First, we are concerned about the uneven playing field between rail and highway projects in terms of local matching requirement and project evaluation criteria. Congress must develop policies which will place rail projects on equal footing with the federal highway program in these two areas. For example, the current expected local match by the Urban Mass Transportation Administration for new rail projects is 50 percent. The local match ratio for highway projects is much lower. In addition, the project evaluation process and criteria are more time consuming and rigid for rail projects, and rely upon an arbitrary cost-effectiveness threshold criteria of $6 per new rider. This criteria ignores equally important factors such as congestion relief, air quality improvements, and the need of growing areas to focus their attention on the integration of land use and transit.

Finally, I wish to conclude my comments by complementing Congress on its recent efforts to strengthen the federal air quality goals and to enhance transportation opportunities for the nation's mobility impaired population. The transportation community, in particular transit systems, will be expected to respond to these new federal mandates. Both the Federal Clean Air Act and the American Disabilities Act will result in new costs to the public transit providers. Indeed, Santa Clara County has a fully accessible system, but it was and will continue to be expensive. It is imperative that congress provide "NEW FUNDS" to the transit industry to carry out these new and important national mandates in an effective and timely manner.

This concludes my testimony. I will be glad to answer any questions that you may have.

TESTIMONY TO THE HOUSE COMMITTEE ON
PUBLIC WORKS AND TRANSPORTATION
SUBCOMMITTEE ON SURFACE TRANSPORTATION
SAN JOSE, CALIFORNIA
July 5, 1990

Presented by
DON FORBES, State Highway Engineer
Oregon Department of Transportation
Room 102 Transportation Building
Salem, OR 97310

I want to thank you, Representative Mineta, on behalf of the Oregon Department of Transportation for the opportunity to testify today on a topic of great importance, that is, the next federal surface transportation act which will be a critical determinant of whether the U.S. shall have a transportation system that meets it's economic and social needs in the decades ahead. Given the other pressing needs in this country, it is easy to overlook our transportation system. Yet, investment in transportation infrastructure is critical to the continued economic vitality of the nation.

The House Committee on Public Works and Transportation should be congratulated on beginning deliberation of this important legislation now; there are many difficult issues to be resolved. For example, a key element of the next act should be funding for the Interstate highway system. The Interstate system is the backbone of America's highway system. It is comprised of the routes of highest national importance, linking principal urban areas with America's borders and coastlines.

While the system comprises only 1% of the nation's highway mileage, it accommodates over 21% of vehicle miles traveled. These routes serve national defense and provide the main corridors of interstate highway transport.

Those of us charged with managing the highways focus on two broad areas of need: protecting the investment, that is preserving the existing system; and modernization, or increasing the capacity of the system to carry more traffic. While modernization needs are great, preservation of this tremendous national investment should be the primary goal of any

future national transportation program. Quite simply, it bestows the most benefit to the most people.

In many respects, Oregon's Interstate system reflects the national system. That is, it is aging and federal revenue sources are not up to the task of meeting even basic needs. Pavements that are in fair condition today will soon reach a point of accelerated wear, declining into the very poor category.

We recognize this in Oregon and have made system preservation our number one priority. We set the highest goals for pavement quality for the Interstate system. In the latest update of our Highway Plan, we ambitiously are aiming for 96% of our Interstates to be in "fair or better" condition by 2010.

Funding constraints force us to set much lower goals for modernization; that is, expanding the capacity of the system. Absent the ability to obtain any discretionary I-4R funds, over this same period we shall succeed in meeting only about 30% of our modernization needs on the Interstates. And, this low performance is only achieved through providing at least $6 million per year in State funds into Interstate preservation beyond matching the Federal I-4R funds. This is, incidently, the first time we have had to apply state resources to Interstate preservation.

The fact is that our estimates of uninflated needs on the Interstate system in Oregon for the next 20 years is twice what we can expect to receive in I-4R funding, at current levels, and this assumes we are able to obtain some discretionary I-4R funds.

In Oregon, under the best of conditions between 1991 and the year 2010, at least $370 million will be needed simply to protect the investment we already have. Nearly $1.5 billion will be needed when modernization projects are added. Under current legislation, anticipated Federal Interstate funds for this type of work amount to approximately $690 million.

We are not asking the federal government to solve all of our problems. For example, Oregon has made a major commitment to care for the other components of our highway system. Since 1985 the Oregon Legislature has raised State gas taxes by 10¢ per gallon, with comparable increases in weight-mile taxes for trucks. Despite that increase, we still only have $1 for every $3 to $4 of identified need in the next 20 years. Federal participation is critical if we in Oregon are to responsibly care for our highway system.

For the federal government to ensure preservation of the Interstate system, funding for I-4R will have to be increased. Either declining pavement quality or substantial reductions in level of service seem inevitable at current program levels.

It is also critical that the allocation of Interstate preservation funds is done in a manner in accordance with system needs. The current federal program for Interstate preservation is Interstate 4R. I-4R funds are apportioned to states according to a formula weighted 55% by the proportion of Interstate lane miles in each state, and 45% by the estimated proportion of vehicle miles traveled on the Interstate system in each state.

In the past, Congressional debate has centered around how to account for Interstate use and its impact on the I-4R funding process. The factors of lane miles and vehicle miles traveled were selected after a review and evaluation by the Federal Highway Administration. Lane miles account for both the extensiveness of the Interstate system in a state and its contribution to 4R needs. Vehicle miles traveled reflects the use of the system and the abuse it may be taking from trucks and traffic in general.

The 1981 amendments to the existing act saw a major shift in the vehicle miles traveled formula, from 25% to 45%, and reflected a major shift of Congressional concern over the impact of traffic on the Interstate system. In other words, Congress accurately recognized that high traffic volumes carried by some segments of the Interstate would result in premature failure of those segments.

Another reason that the 1981 amendments reduced the emphasis on lane miles was that many of these lanes were relatively new. However, today we are at the point where most of the lanes on the Interstate system are reaching their 20-year design life, whether from traffic or aging, and need major rehabilitation work. Therefore, it is time to reassert the role of lane miles as the primary indicator of need in the preservation formula.

It is important to note that "lane miles" is also the more accurate of the two measures. "Vehicle miles traveled" is an estimate of use and, therefore, subject to interpretation. "Lane miles," on the other hand, is easily quantified and verifiable by all parties.

I also would like to call the Committee's attention to the to topic of scenic byways. Last year, Congress directed the Federal Highway Administration to conduct a national scenic byways study which calls for the development of guidelines for establishing a National Scenic Byways Program. Oregon endorses this initiative and is conducting one of the case studies called for as part of the study.

In areas of unique scenic beauty and recreational opportunity, the highway system will have to safely accommodate large numbers of older drivers--many driving cumbersome RVs--along with more cyclists, tour buses, trucks and local traffic. This increased traffic will have to be accommodated while we simultaneously preserve the scenic and environmental qualities the visiting public has come to see.

A number of factors indicate a significant increase in demand for recreational driving in the next several decades as the baby boom generation enters its late middle age years. This large portion of our nation's population will have both high discretionary incomes and substantial leisure time, which in combination will result in a considerable increase in recreational driving. In fact, we already are experiencing this increase in demand.

Further, bicycle touring and vacationing is increasing at an annual rate of 10%. The number of recreation vehicles sold each year increased more than 118% in the last decade, and will continue to grow as baby boomers approach retirement.

In Oregon, we are confronting this challenge today along the Pacific Coast, a recreational and scenic corridor of world class quality. The Department is in the process of developing and planning the construction of a scenic highway corridor along the coast which will protect and enhance the aesthetic qualities of the corridor while serving its unique transportation needs. Our approach utilizes Oregon's strong land use planning laws, total public ownership of Oregon beachfront, our commitment to highway access control, and a variety of parkway and safety design features.

A project demonstrating parkway design for urbanizing areas is due to begin construction in August. Other projects unique to the scenic corridor are in development, and our Transportation Commission has authorized further planning and design studies.

Scenic corridors, however, are determined by natural characteristics, not political boundaries. The Pacific Coast is a national asset. In our opinion, any system of national scenic byways would have to include the highways and roads along much of the entire Pacific Coast; not just that in Oregon.

Our ability to develop a scenic highway corridor extending beyond Oregon's borders has proven limited. Although there is interest in Washington and California in what we are doing, there is no mechanism available for exploring the idea in a comprehensive way.

The federal government has a role to play here. Active federal leadership in defining, designating, coordinating and planning unique multistate scenic highway corridors would provide the necessary vehicle for advancing a complex multijurisdictional effort like that we envision on the Pacific Coast. We would recommend the Committee review the National Scenic Byways Study with this important federal role in mind. Thank you for your consideration.

PUBLIC TESTIMONY

TO

THE SUBCOMMITTEE ON SURFACE TRANSPORTATION

COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION

U.S. HOUSE OF REPRESENTATIVES

By

Gerald V. Gibney
Vice President, Transportation
ICF Kaiser Engineers, Inc.
1800 Harrison Street
Oakland, CA 94612

415/268-6840

July 5, 1990

Mr. Chairman,

My name is Gerald Gibney. I'm Vice President and Regional Manager, Transportation, for ICF Kaiser Engineers. I'm based in Oakland, California at our world headquarters office. I am also a Director of the Consulting Engineers Association of California and a member of the American Consulting Engineers Council Transportation Committee at the national level.

My firm is one of the top transportation engineering consulting firms in the U.S. and internationally. In my 20 years of experience in transportation, there has never been a time when both the opportunities and the dangers for transportation have been so great. We all agree that this nation's infrastructure is decaying at an alarming rate and that the lack of transportation facilities is adversely affecting our ability to compete in the world marketplace. Here in California it is especially evident that affordable housing is, in fact, not available close to job centers. Transportation to our offices throughout California from our employees' homes is difficult, time consuming, and very very expensive. Business travel between cities in California and throughout the nation is in similarly bad shape.

Most everybody here in California would agree on the severity of the program. The question is: What are we going to do - what can we do - about it?

The people of the State of California have voted affirmatively to increase user fees - taxes - for transportation. They did so because it was necessary and because the leadership of this state, public and private, was united in recognizing the need and in devising a plan. In order to succeed, the

national leadership is going to have to be similarly united.

The administration is currently collecting more in gas taxes than it is disbursing from the trust fund. There is even talk of raising the gas tax to reduce the deficit. It is short-sighted to be holding up funds already collected in the transportation trust fund while highways and transit are deteriorating. It is even more short-sighted, in our view, to speak of using the gas tax to reduce the deficit. An increase in the gas tax is necessary for the purposes for which it has traditionally been used - investing in the transportation system. That investment is needed now because if we delay, the inflated future costs would be prohibitive.

Mr. Chairman, you, your colleagues and the staff of the Committee on Public Works and Transportation have worked hard with the California Department of Transportation to devise California's recommendations for a Post Interstate National Surface Transportation Program. The recommendations are comprehensive and systematic. They address changes in the program structure and federal funding levels, financial innovation and federal oversight. Those recommendations deserve congressional support, and the business community is confident that our state congressional delegation will make itself heard on the Hill. We urge the Congress to stand firm in this critical time of defining the future of surface transportation - both transit and highways - for the nation.

As a representative of the private sector, I would like to address three issues of particular concern to us.

One, private sector engineering design is of obvious interest to us. The private sector is a vast reservoir of engineering talent that is innovative and cost effective. California has increased its use of consulting engineers in recent years and increased contracting-out has brought new resources to capital project delivery. The fast response capability of the private sector was particularly evident in the aftermath of the Loma Prieta earthquake, when our capabilities were quickly brought to bear. We want to be part of the solution.

Second, we applaud congressional efforts to improve business conditions in the provision of engineering services. Qualifications-based selection in accordance with the Brooks bill is vital to the best interests of both the public and private sector. The marginal cost of procuring quality engineering services, as opposed to unqualified services and low-balled bids, is minuscule in comparison to the benefits which accrue and the costs of the disasters which are avoided.

Third, we urge you to acknowledge the need of the states to have the flexibility to pursue the privatization of transportation facilities and systems where it makes sense. Privatization is not a panacea, but it is a viable means of unleashing resources which are badly needed in this country. Entrepreneurial innovation using private capital to augment the public system to improve safety and capacity makes sense for America.

Thank you for the opportunity to be heard at this hearing. The private sector is capable, responsive and of value in the field of transportation. We want to help and sincerely appreciate the opportunity to be heard today.

PRESENTATION BY VINCENT HARRIS, DEPUTY DIRECTOR

ALAMEDA COUNTY TRANSPORTATION AUTHORITY

to the

HOUSE PUBLIC WORKS COMMITTEE

July 5, 1990

San Jose, California

My name is Vincent Harris and I am appearing here at the request of the Authority's Governing Board. The Authority Chairperson, Mayor Dave Karp of the City of San Leandro, sends his regrets as he had a prior commitment today.

As you are aware, Alameda County is one of fourteen "self help" Counties in California. The Alameda County Transportation Authority administers this voter approved one half cent sales tax for otherwise unprogrammed transportation improvements in Alameda County. The projects in the program were identified as the most essential in the County. Our program includes rail projects, local streets and roads, and major Interstate highway facilities.

Alameda County's program, which will amount to approximately $1 Billion in a fifteen year period, is aimed at correcting currently perceived deficiencies. It does not provide for future transportation needs.

In addition, we found that these voter approved sales tax funds are inadequate to meet our full transportation expenditure plan commitments. The recent Statewide transportation measures will offer some assistance in this regard. However, here again, the available funding will be heavily dependent on continued Federal support and will only start to address current needs.

In Alameda County there are approximately forty miles of designated Interstate Routes that have received no Interstate construction funds and barely enough Interstate 4R funds to maintain the existing inadequate roadways. It is these routes of National importance and other neglected "missing urban links" that need continued Federal assistance to meet future needs in this growing region. We refer to "neglected" links in the total system, as the emphasis on Interstate completion did result in shortages elsewhere.

We have two examples in Alameda County of routes that are of National importance but which have received insufficient funding to match their needs. These routes are I-880 and I-238.

I-880, the Nimitz Freeway, was designated under Section 139((a)) of Title 23. We have a sales tax commitment for improvements on 13 of the 35 miles of this facility in the amount of $220 million. However, we have identified a total need on our portion of I-880 amounting to $458 million, in 1990 dollars. The increases on this route and on other sales tax projects are due to such matters as increases in the scopes of work to meet Federal requirements and to the need to rehabilitate the existing roadways. For instance, our commitment on I-880 was for freeway widening. We now find that we may be required to build a high occupancy vehicle facility and we find that much of the existing plant is worn out and needs replacing.

We do not have a commitment to I-238, a similarly designated 139(a) system inclusion. However, I-238 connects I-580 and I-880 and, because of truck restrictions in the City of Oakland, serves all Interstate truck traffic entering the Bay Area from Central Valley over I-580. Correcting the deficiencies on this major

Interstate truck facility will cost over $100 million, and there are no available State or local funds currently available for this work.

Accordingly, we urge reauthorization and increase of the Federal gasoline tax for transportation purposes for the following reasons:

1. To meet the growing needs of this region.
2. To protect and enhance the existing Federal transportation investment.
3. To assist and reward local efforts aimed at maintaining and upgrading routes of National importance.
4. To provide for missing links in the transportation system.

Our presentation notes some of the problems in Alameda County. However, as the Bay area grapples with air quality, transportation and land use issues, we are well aware that solutions must be worked out in a regional setting. Our comments could well apply to any or all of the Bay Area Counties.

In closing, I repeat that the Alameda County Transportation Authority strongly supports reauthorization and increasing the Federal gasoline tax for Transportation purposes.

TESTIMONY OF
WILL KEMPTON
EXECUTIVE DIRECTOR
SANTA CLARA COUNTY TRAFFIC AUTHORITY

REGIONAL FIELD HEARING
HOUSE COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION
SUBCOMMITTEE ON SURFACE TRANSPORTATION
THURSDAY, JULY 5, 1990
SAN JOSE CITY COUNCIL CHAMBERS

REAUTHORIZATION OF THE POST-INTERSTATE
SURFACE TRANSPORTATION PROGRAMS

GOOD MORNING, MR. CHAIRMAN AND MEMBERS OF THE SUBCOMMITTEE. MY NAME IS WILL KEMPTON, AND I AM THE EXECUTIVE DIRECTOR OF THE SANTA CLARA COUNTY TRAFFIC AUTHORITY. THE TRAFFIC AUTHORITY IS A LOCAL AGENCY RESPONSIBLE FOR ADMINISTERING THE PROCEEDS OF A ONE-HALF CENT SALES TAX INCREMENT APPROVED BY COUNTY VOTERS IN NOVEMBER OF 1984. THE TEN-YEAR SALES TAX PROGRAM, WHICH EXPIRES ON APRIL 1, 1995, WILL RAISE NEARLY A BILLION DOLLARS FOR IMPROVEMENTS TO THREE STATE HIGHWAYS IN SANTA CLARA COUNTY. TWO OF THESE HIGHWAYS, ROUTES 85 AND 237, ARE PART OF THE FEDERAL AID URBAN SYSTEM. ROUTE 101, THE THIRD PROGRAM LEG, IS AN IMPORTANT NORTH-SOUTH LINK IN THE FEDERAL AID PRIMARY SYSTEM.

AS YOU KNOW, MR. CHAIRMAN, WE ARE WELL ALONG IN IMPLEMENTING THE IMPROVEMENTS MANDATED BY THE VOTERS. THE WIDENING OF ROUTE 101 IS TWO-THIRDS COMPLETE, WITH THE REMAINING THIRD GOING TO CONSTRUCTION THIS SUMMER. IMPROVEMENTS TO EXISTING ROUTE 85 ARE COMPLETED AND AVAILABLE FOR USE BY COUNTY COMMUTERS, WITH CONSTRUCTION OF THE NEW ROUTE 85 FREEWAY WELL ALONG. LARGELY DUE TO ASSISTANCE PROVIDED BY YOUR OFFICE, CONSTRUCTION ON ROUTE 237 IS EXPECTED TO BEGIN THIS FALL, AS WE EXPECT A RECORD OF DECISION ON THE ENVIRONMENTAL IMPACT STATEMENT FOR THIS IMPORTANT PROJECT LATER THIS MONTH.

THE MEASURE A PROGRAM, SO-CALLED FOR ITS BALLOT DESIGNATION, IS THE FIRST OF ITS KIND IN THE STATE OF CALIFORNIA. SINCE OUR VOTERS APPROVED THIS MEASURE IN 1984, 14 OTHER COUNTIES IN THE STATE HAVE FOLLOWED OUR LEAD IN APPROVING SIMILAR MEASURES. THESE PROGRAMS WILL RAISE MORE THAN ELEVEN BILLION DOLLARS FOR TRANSPORTATION IMPROVEMENTS IN THIS STATE. MUCH OF THIS MONEY WILL BE INVESTED IN THE FEDERAL HIGHWAY SYSTEM, INCLUDING INTERSTATE HIGHWAY IMPROVEMENTS, AND IN TRANSIT FACILITIES WHICH IN MANY INSTANCES ARE ELIGIBLE FOR FEDERAL PARTICIPATION.

IN TERMS OF THE POST-INTERSTATE REAUTHORIZATION, THE AUTHORITY STRONGLY SUPPORTS WHAT APPEARS TO BE A UNIVERSAL APPEAL FOR FLEXIBILITY IN THE DEVELOPMENT OF A NEW FRAMEWORK FOR ALLOCATING FEDERAL TRANSPORTATION DOLLARS. HOWEVER, WE WOULD URGE THE SUBCOMMITTEE TO EXAMINE THE POSSIBILITIES OF LEVERAGING A HIGHER RETURN ON THE FEDERAL INVESTMENT IN TRANSPORTATION IMPROVEMENTS THROUGH THE ESTABLISHMENT OF A LOCAL INCENTIVE PROGRAM. OUR CONCEPT OF SUCH A PROGRAM IS SIMILAR TO ONE RECENTLY APPROVED BY THE STATE LEGISLATURE AND FUNDED BY THE PASSAGE OF PROPOSITION 111 LAST MONTH.

THE STATE-LOCAL PARTNERSHIP PROGRAM PROVIDES TWO BILLION DOLLARS OVER THE NEXT TEN YEARS TO MATCH TRANSPORTATION PROJECTS WHICH MEET CERTAIN CRITERIA, INCLUDING DELIVERABILITY REQUIREMENTS. THE PROGRAM SERVES TO ENCOURAGE LOCAL CONTRIBUTIONS TO STATE TRANSPORTATION PROJECTS, AND THE STATE MATCHING MONEY IS A TREMENDOUS ASSET IN HELPING TO DEFRAY PROJECT COSTS FOR LOCAL AGENCIES. A SIMILAR MATCHING OR GRANT PROGRAM AT THE FEDERAL LEVEL WOULD CREATE THE SAME KINDS OF BENEFITS, AND WOULD FURTHER FOSTER THE NOTION OF INTERGOVERNMENTAL COOPERATION.

THE LAST POINT I WOULD LIKE TO RAISE TODAY, MR. CHAIRMAN, DEALS WITH THE PROJECT DEVELOPMENT PROCESS--THE TIME IT TAKES TO GET A PROJECT FROM THE INITIAL PLANNING STAGE TO CONSTRUCTION. THE TRAFFIC AUTHORITY RECOGNIZES AND SUPPORTS THE NEED TO MEET SOUND AND REASONABLE REQUIREMENTS AS PART OF THE ENVIRONMENTAL AND DESIGN PHASES OF PROJECT DEVELOPMENT. HOWEVER, THE INVOLVEMENT OF THE REGULATORY AGENCIES CHARGED WITH OVERSEEING THE PROCESSES FOR MEETING THESE REQUIREMENTS CAN SOMETIMES BE VERY TIME CONSUMING. WE SUGGEST RATHER THAN REDUCING OR ELIMINATING THE REQUIREMENTS, THAT APPROPRIATE TIME LIMITS BE ESTABLISHED FOR AGENCY REVIEWS. THIS ACTION WOULD NOT IMPACT THE EFFECTIVENESS OF EXISTING PROTECTIONS, BUT MIGHT CONTRIBUTE SIGNIFICANTLY TO IMPROVING PROJECT DEVELOPMENT TIMES. WHILE THE SUBCOMMITTEE MAY DECIDE NOT TO CONSIDER THIS ISSUE IN THE REAUTHORIZATION PROCESS, PROJECT DELIVERY IS AN IMPORTANT PROBLEM WHICH SHOULD BE REVIEWED IN THE NEAR FUTURE.

THAT COMPLETES MY TESTIMONY. IN CLOSING, LET ME OFFER THE ASSISTANCE OF THE TRAFFIC AUTHORITY IN WORKING WITH YOUR STAFF TO FURTHER DEVELOP ANY OF THE COMMENTS I HAVE MADE TODAY. OUR THANKS AGAIN TO YOU, MR. CHAIRMAN, FOR ALL OF YOUR ASSISTANCE IN THE CONDUCT OF THE MEASURE A PROGRAM. IF THERE ARE ANY QUESTIONS, I WOULD BE HAPPY TO ANSWER THEM AT THIS TIME.

The Honorable Norman Y. Mineta
Chairman
Subcommittee on Surface Transportation
U. S. House of Representatives
Washington, D.C. 20516

Dear Chairman Mineta:

My name is Arielle Leonard and I am Director of Transportation and Land Use for the Santa Clara County Manufacturing Group. The Manufacturing Group is a business association with more than 100 corporate members which addresses public policy issues that impact the business climate and quality of life in the Santa Clara Valley.

Since its inception over a decade ago, the Manufacturing Group has considered transportation a priority issue. We have been active in the local and regional transportation planning process and have initiated and/or supported numerous transit and transportation projects including BART and other rail extensions, our county-wide half-cent sales tax and the recently-enacted Proposition 111. The President of the Manufacturing Group, Mr. Gary Burke, participated in a series of discussions organized by the California Transportation Commission last year relative to the Reauthorization of the Post-Interstate Program.

A modern, efficient transportation system in Silicon Valley is crucial to the continued vitality of our high-tech industry. The decisions you make concerning the reauthorization of the post- interstate programs will not only impact the mobility, air quality and lifestyle of the region, but the economy as well.

The effects of traffic congestion on the economy are very real and have been felt by virtually every major corporation in this area. Employees who are now commuting unprecedented distances to get to work are sharing the roadways with an unprecedented number of other commuters. And, if the prognosis of 300,000 new jobs in Santa Clara County within the next 10-15 years holds up, things will be considerably worse.

5201 Great America Parkway Suite 436 Santa Clara, California 95054 (408) 496-6601 Fax (408) 496-6604 Printed on Recycled Paper

This situation not only robs these workers--and their employers--of productive time; it also takes its toll on their mental and physical health, rendering them less capable of doing their jobs.

Traffic congestion and lack of mobility have made the critical problem of recruiting talented professionals to the area extremely difficult if not impossible.

None of this, however, is new news to this committee. I simply wish to add the urgent voice of the high-tech industry to the chorus of concern expressed by our local government representatives and transportation agencies that we arrive at a realistic, sensible way to channel post-interstate dollars into local and regional transportation programs. Action is required now to keep our county and region mobile and economically healthy.

As we look to the reauthorization of the post-interstate programs, several points make sense:

The role of the federal government in transportation should not be diminished any further than it already has. While obviously Californians, and Santa Clarans in particular, are not adverse to reaching into their own pockets in order to improve our transportation system, we're still very much in need of federal dollars if we're to keep up with the degree of population growth that the state is expected to see in the next 20 years.

When it comes to directing the expenditure of federal money, we agree with some of the key points previously made to this committee by Larry Dahms, Executive Director of MTC.

Our first priority must, of course, be to maintain the enormous investment we've already made in our interstate system. But beyond that, we need to revise our vision somewhat in order to address our transportation needs effectively.

As Larry Dahms pointed out, the interstate system does the job of providing access from one metropolitan area to another--but getting around within that region is where we have our real problems. We agree with MTC that we need to take a systems approach based on the particular circumstances of a given area. Federal funding should be flexible enough to accommodate local needs for transit, highways, HOV lanes and TSM programs.

Funding criteria should be related not simply to mobility but to conformance with regionally acceptable clean air and land use standards.

The unique combination of factors that have made Silicon Valley the high-tech capitol of the world is being threatened by traffic strangulation. Industry requires swift federal action to ensure adequate state, regional and local transportation in the post-interstate era.

Submitted by:

Arielle E. Leonard

Arielle Elisabeth Leonard
Director of Transportation and Land Use

Mr. Chairman, I am Chuck Mack, President of Teamsters Joint Council No. 7 in San Francisco, California. I would like to thank you for this opportunity to appear before you today to outline our views on omnibus highway legislation. As you well know, the International Brotherhood of Teamsters is the advocate for the employees who drive on our nation's highways. As you have heard before our members and their companies are the safest and most efficient carriers on our nation's roads. The Teamsters Union supports the goals of the "highway bill" to promote the best organized, most efficient and safest system of highway motor carrier transportation. It is these essential goals that Congress must enact. In the Motor Carrier Act of 1980, Congress directed that the National Transportation Policy should "enable efficient and well-managed carriers to earn adequate profits, attract capital and maintain fair wages and working conditions. Instead in the past ten years, we have seen some in this industry and recent Administrations decouple themselves from these laudable goals. Rather they have wedded themselves to bottom-line economic philosophies where rate cutting, marginal safety records, and over worked employees are the way of life.

Mr. Chairman, we fully understand the mechanics of this bill. Not only do federal excise taxes on diesel fuel fund interstate highway development, bridge improvements, and highway safety programs, but also they can potentially be an overwhelming burden on our industry if federal excise taxes

are increased beyond the ability of our employers to compete with other transportation modes. The recent history of our industry is replete with bankruptcies where the mandated costs of deregulation, tax code changes, recession and interest rates have forced our members to the mercy of Chapter 11 bankruptcy judges. We cannot stress too strongly how much an impact this legislation will have on our members employed in the delivery of our nation's goods. Moreover, we remain mindful that highway construction mandated by your committee brings thousands of jobs to our members in the construction and building trades - as you can see whatever decision you make a Teamster and their family will be affected.

Mr. Chairman, while we support efforts to promote efficiency and effectiveness in the motor carrier industry, we remain solidly opposed to further efforts to deregulate the trucking industry. As we forecasted over a decade ago, deregulation has sacrificed thousands of Teamsters to the low-payed, over-worked, unsafe and often in violation, gypsy and fly-by-night brokered truck operators. In reaction to the environment spawned by deregulation, your own Committee has recently passed legislation to end one of the most abusive practices of this sector of the industry - garbage and toxic waste backhaul.

The industry will ask for productivity enhancements if they are burdened by overly aggressive increases in federal excise taxes. We urge you in your deliberations to reject

'miracle cures' to balance increased tax increases with so-called efficiency and productivity remedies.

In 1982, we agreed with the industry for increases in size, weights and longer combinations vehicles (doubles) on our nation's interstates. In the ensuing eight years, we see no need to tear apart the carefully constructed balance created by the Surface Transportation Assistance Act of 1982. The compromises agreed by all in 1982, including the motor carrier industry, established reasonableness and sanity to truck weight and size. This uniformity must be preserved. The International Brotherhood of Teamsters opposes any expansion of the use of triple trailers, "rocky mountain doubles" or any other scheme which manipulates truck size and weight.

Larger and heavier trucks make braking more critical. Congress should not permit these larger vehicles at a time when neither the Department of Transportation is yet ready to mandate nor the carriers ready to accept anti-lock brakes. This occurs despite the fact that brake problems are the number one reason for out-of-service orders at roadside inspections. Moreover, DOT has failed to act at our request for tire tread improvements that would increase braking ability. Given the unacceptable level of enforcement already in this industry, can you imagine what "triples" will cause when a under-financed, cut-throat trucker gets his hands on triple trailers?

An additional problem with these longer combination

vehicles is access - another holy grail of the Safe Truck Assistance Act of 1982. Despite an understanding of access to terminals agreed to by the industry in 1982 legislation we see in the last month that DOT all but eliminated the ability of local communities to limit access to terminals and facilities for food, fuel, rest and repair. DOT administratively defined a "terminal" as anywhere you load or unload a truck. Already, we have received complaints from our members about having to 'peddle' off a set of doubles in a previous 'non-terminal' delivery area. Soon I expect you will hear from your constituents about this increase in truck productivity.

Again, as we have argued in the past, we urge you to preserve the rights of each individual state to regulate its intrastate commerce over all vehicles engaged in motor surface transportation, regardless of the ownership or parentage of their principal line of business. Trucking by surface as well as air cargo carriers should be treated identically.

We have heard the trucking industry make appeals to the federal legislature regarding unjust licensing, taxing and non-uniformity in administration of the trucking industry. We hope these problems can be handled in a efficient manner with out further undermining basic federal and state principles for safe conduct in the trucking industry. Again, the IBT calls for the inclusion of the shipper in the overall responsibility for the operation of this industry. It is the

shipper who runs the economic equation in the trucking industry. The shipper has goods to be delivered and under the present system he can do this with regard for only one standard - COST. I hazard that you agree to some extent with this proposition given the new standards applied to shippers in the hazardous material transportation bills moving through your committee. We applaud you for that endeavor, but would like to warn you about the administrative relief that is available later and outside of the immediate purview of the committee of jurisdiction. Additionally, I would like to point out that the issue of trucking costs cause many of the problems found in our industry. Rate cutting, despite the legal principle of the filed rate doctrine have fueled bankruptcies and unemployment. This can only be solved by minimum rate standard which addresses this critical problem.

In closing Mr. Chairman, I would like to take this opportunity to thank you for your assistance and interest to ensure that government mandated drug testing is done in a constitutional and reasonable fashion. Only with strict guidelines can an employee be assured that his sample is being handled by a laboratory of the highest clinical standard and that any results are reviewed by proper individuals who can guarantee privacy and confidentiality. Finally, we would again pledge our support for your overall activities for a new highway authorization. We remain committed to highway construction funding out of its proper

trust fund. On behalf of the thousands of Teamsters involved in the construction, maintenance and operation of our nation's highways. Thank you.

THURSDAY, JULY 5, 1990
SUBCOMMITTEE ON SURFACE TRANSPORTATION
COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION
U.S. HOUSE OF REPRESENTATIVES
SAN JOSE, CALIFORNIA

RE: Re-authorization of the post-interstate surface transportation program. Remarks by Stephen Nieman, vice President of Strategic Marketing and Planning, American President Domestic Companies, Ltd.

Good afternoon. My name is Stephen C. Nieman. I am Vice-President, Strategic Marketing and Planning of American President Domestic Company, a unit of American President Companies, Ltd. American President Companies business mission is to be the leader in transportation of containerized freight and in distribution and logistics services within and between North America and Asia. American President Companies is made up of two principal subsidiaries: American President Lines, a major Pacific basin container transportation company, and American President Domestic, which provides rail, trucking and domestic freight brokerage services in North America. Our company provides both independent, single-mode services and highly integrated, information-intensive, multi-modal services.

We appreciate the opportunity to appear before you early in your hearing process for the next surface transportation bill. We are enormously pleased, and proud, that you, Mr. Chairman, and Chairman Anderson will be leading figures in determining the content of this critical legislation. We know that you understand that the impact of this legislation will reach well beyond the United States highway system, and will affect all American citizens as well as many foreign citizens.

American President Companies has a somewhat unique view of international and domestic transportation markets. Casting all modesty to the winds, APC is probably the best example of an intermodal transportation system in the United States. That is not to say that we are the best company we can be -- all of us in the transportation community know that there is enormous room for improvements in service to our customers. However, we do believe our company's structure and philosophy faithfully reflects our view that transportation companies and policy should be more focused on service to markets rather than the traditional approach limiting service options to specific modes. We believe that intermodalism at its best can serve markets most efficiently, and we therefore encourage the Subcommittee and the Congress to be mindful of intermodal trends and our orientation to transportation as you begin to draft this new legislation.

An integrated, intermodal freight transportation system has significant advantages for the American economy and ought to be encouraged. These advantages include: (a) identifying and utilizing the most productive features of maritime, inland waterway, rail and truck modes; (b) providing a competitive, point to point distribution system for both domestic and international freight that has established a

worldwide benchmark for efficiency; (c) boosting U.S. industrial competitiveness in world markets by creating systems that can economically support America's increasing export and import efforts; (d) providing environmentally acceptable transportation services that relieve highway congestion, lessen safety risks, and reduce air pollution by using the most appropriate and efficient modes in the places and to the extent that they are advantageous; (e) reducing the burdens on U.S. bridge structures and highway pavement by utilizing rail transportation for the majority of the miles in corridors where appropriate; and (f) solving large scale transportation challenges through private-industry solutions.

Taking the best that each mode of transportation has to offer is not an easy management task, nor is such a system easy to promote via governmental policy. This is because successful intermodalism is a relatively new phenomena. It is growing despite obstacles erected by proponents of the individual modes and by public policy. Nonetheless, intermodalism is becoming successful because of its inherent advantages in an economy that has become truly global, and because shippers and receivers of goods are increasingly requiring a higher quality of service, often tailored to their unique distribution needs. The intermodal approach offers the flexibility to efficiently meet those needs. Traditionally, transportation offerings have been based on a single mode with little or no regard for trading off the costs and benefits of combining the appropriate aspects of various modes. This stems largely from the fact that most transportation companies are "pure play companies" offering only one mode. Accordingly, most public policy and legislative efforts have been modal based rather than integrated across a variety of modes with an eye towards markets.

Successful future systems will cut across any mode's specific bias to provide the best service and price to each customer. Each mode should be allowed to exercise its natural advantages, but more particularly there should be no inhibitions on the ability of any intermodal system to combine the best that each mode has to offer. Only in this way can American shippers and Consignees be provided with world class, competitive transportation service.

It appears to us that public policy should encourage the private sector to make the necessary trade-offs of the costs and benefits of individual modes when considering modal alternatives, and that public policy should discourage pockets of artificially high factor costs or artificially low productivity.

More specifically, to encourage an increase in the workload of the Nation's highways seems foolish at a time when highway capacity is strained but the Nation's rail capacity is underutilized. To encourage increased fuel consumption by encouraging more trucks on long-haul corridors at the expense of a fuel-efficient rail mode seem shortsighted. To encourage increased truck sizes as a solution to an unproven shortage of truck drivers seems counterproductive, particularly when fewer persons are necessary to move a comparable number of units via an intermodal transportation system. It seems unwise to invest current public dollars in more highway capacity when significantly under-used rail capacity exists or can be accessed by relatively modest, private investment.

38-253 O—91——83

In other words, a modally-biased transportation system fails to allow the necessary trade offs between modes. Short-sighted public policies frequently may inhibit these trade-offs, in spite of emerging social and economic considerations which may encourage shifts from one mode to another to take advantage of particular modal characteristics.

In our judgment, what has to be done is to honor the existing linehaul economics. Double-stack, rail-based systems are more economical than truck for longer lengths of haul and are service competitive. Shippers ought to be encouraged to consider placing those long-haul loads into an intermodal system, and they will find that encouragement in the economic and service factors themselves. These factors should not be distorted by regulatory or legislative barriers.

There is a place for new legislation designed to support some of the socio-economic realities of the 1990's. Such legislation would recognize and encourage the social and environmental benefits of intermodalism that have not to date been adequately recognized because of the narrowly focused modal orientation of our transportation tlaws, regulations and governmental organizations.

We believe that the true advantages of intermodalism are only beginning to become evident. They are emerging despite some of the handicaps that any one mode might face because intermodalists are constantly looking across the modes to take advantage of the best that each has to offer. And, because U.S. shippers and consignees are starting to recognize and demand the improved efficiencies and economics that intermodal system provides customers are providing the guidance and goals we need to optimize America's transportation system.

If external incentives, such as an unbalanced surface transportation bill unduly tilted towards highways, were to create incentives to take the loads that we currently put into U.S. rail service and suddenly put them into an all highway service, it would put a serious incremental burden on the highway system. Its conceivable that public policy and the new highway bill could cause a drift in that direction -- and although we know that you and your fellow subcommittee members are mindful of the need to fully recover all costs associated with increased productivity of trucking, many intermodalists are concerned that a full recovery is unlikely.

Conversely, to take the long-haul loads in North America that today move all highway and divert them into a truck-rail-truck system, taking advantage of the benefits that each mode has to offer in its "natural state", may well tax some aspects of the infrastructure temporarily. However, at the same time it would produce a number of benefits that are definitely for the social good. We believe the benefits of increased intermodal use would be reduced congestion, reduced pollution, fewer accidents, increased competitiveness in the global marketplace, and a private transportation system that would continue to be unparalleled in the world in terms of efficiency and productive utilization of assets.

Mr. Chairman that ends my testimony. Perhaps I should have prefaced my remarks by saying that I have spent my career in a variety of trucking and rail companies, and feel a deep commitment to America's transportation system. I'd be glad to answer any questions you may have at this time and would like to again commend you for holding these hearings. American President Companies looks forward to providing whatever assistance we can during your deliberations in the months to come.

STATEMENT OF RONALD G. PELZEL

EXECUTIVE VICE PRESIDENT

VIKING FREIGHT, INC.

Before the

Subcommittee on Surface Transportation

Reauthorization of the Post-Interstate
Surface Transportation Programs

July 5, 1990

San Jose, California

Good morning Mr. Chairman and members of the Subcommittee.

My name is Ron Pelzel and I am the Executive Vice President of Viking Freight, Inc. of San Jose, California. Viking Freight, Inc. is a certifcated ICC motor carrier of general commodities freight. Viking's operations are primarily in the western United States. Currently Viking operates in excess of 1400 power units and 4600 trailers and employs approximately 4000 people. In 1989, Viking trucks travelled over 58 million miles on the highways.

I am here today to present to the Committee our perspective on the reauthorization of our nation's highway program. While our concerns cover virtually all aspects of the high-way program, I will limit my comments to three areas. First, the need to continue a strong federal role in our highway system. Second, the need to maintain the integrity of the Highway Trust Fund and the taxes supporting that Fund. Finally, the need to address the problem of urban congestion through greater federal, state and local cooperation on incident management programs.

I don't think anyone today seriously questions the important role that transportation and specifically highway trans-portation plays in maintaining our nation's economic well being. In the introductory statement accompanying his national transportation policy initiative, DOT Secretary Sam Skinner stated that "no industry in the nation is more important to U.S. economic growth and international competitiveness than transportation".

While we might expect such words from a Transportation Secretary, further evidence was offered from a source not normally associated with highways and

transportation. Mr. David Aschauer, a senior economist at the Federal Reserve Bank of Chicago, put in very succinctly when he recently stated:

"I have found that there is indeed a strong and robust link between the level of infrastructure investment and the Nation's ability to increase its level of productivity."

Mr. Chairman, the manufacturing, distribution and transportation patterns of this country make it imperative that we continue a highway program that is national in scope and increases overall capacity. While it may be a difficult message to convey, the citizen in California has as much stake in out-of-state highways as he/she does in Interstate 5.

It is our strong belief that the same motivation that went into the development and now completion of the Interstate highway program must continue into the post-Interstate program. Our concern for maintaining a strong federal role in highway transportation is closely aligned with our second concern, maintaining the integrity of the Highway Trust Fund and its supporting taxes.

There certainly are those who can give you a much better analysis of authorizations, obligation ceilings, outlays, and all that other budgetary mumbo-jumbo. From our vantage point, it seems that if OMB spent as much time actually spending the money as it does trying to come up with Rube Goldberg type explanations of how there really is no surplus in the Trust Fund, our highways would be in much better shape.

It will come as no surprise to the Committee that our primary concern with the Trust Fund is the impending debate over raising fuel taxes and whether those taxes should go to deficit reduction rather than the dedicated highway fund. I can think of nothing more damaging to our highway program than allowing fuel taxes to be used for purposes other than highway related programs.

One of the major arguments made in support of using the federal fuel tax for deficit reduction is the fact that the tax is low, particularly relative to the levels of other industrialized nations.

Mr. Chairman, I have a hard time envisioning Japan or Germany willingly eliminating a major competitive advantage which is precisely what we would be doing with transpor-tation costs under such a tax increase.

It also is important to remember that the fuel tax rate is not limited to the federal levy, but also includes state and, in some areas, local taxes as well.

Here in the West, we are subject to state fuel tax levies as high as $0.22. In California, voters just approved an increase of $0.11 phased in over a five year period to be used only for transportation purposes. The pattern is being followed throughout the country as approximately two-thirds of the states have increased fuel taxes in the past three years.

I would be remiss if I did not acknowledge the efforts of this Committee to resist any and all efforts to divert fuel tax increases to general funds. We will help in anyway we can to assist you in the battle ahead.

I would now like to turn to an initiative that we would encourage the Federal Government take on in cooperation with state and even local governments: the development of incident management programs. Incidents is a term that includes accidents and numerous other highway events like stalls, flats, spills, debris on the road and even highway maintenance work.

The American Trucking Associations, through its Trucking Research Institute, recently completed a year long study on the problems associated with urban congestion and how the management -- or non management -- of highway incidents can have substantial impacts.

According to FHWA estimates for 1987, incident congestion cost the nation 1.3 billion vehicle hours of delay at a loss of nearly $10 billion. A dozen large cities - Los Angeles and San Francisco are near the top of the list - account for over 80 percent of freeway congestion cost.

Why are we concerned over congestion and the proper management of freeway incidents? First and foremost, these problems have a direct impact on our service, productivity and ultimately our profitability. As a regional carrier offering next day service for shippers with just-in-time production runs, the margin for error due to delays is very small.

A second concern relates to the unique relationship we have with the public sharing the road. The public's perception that truck incidents are responsible for the growing level of congestion has resulted in demands for truck route restrictions, time of day restrictions, and outright bans on major urban arteries. The irony here is that many, if not all, of these proposals

would result in more truck traffic, greater congestion problems and higher costs.

Th TRI study reviewed the problem of congestion and incident management programs and made the following observations:

-The major impediment to the development of incident management programs is the lack of a clear mandate. Major metropolitan areas and their attendant traffic problems extend far beyond the city limit. For some, like New York City or Washington, D.C., the problem extends even beyond state lines.

-Efforts to develop comprehensive incident management programs have been hamstrung by an inability to coordinate numerous and sometimes conflicting agencies. A small sample of effected agencies would include state police and highway authorities, local police and fire departments, private tow truck operators, hazardous materials specialists, vehicle insurers, environmental agencies and public health officials.

-The costs of incident congestion and therefore the benefits to be gained by reducing incident delay are not well understood. This obviously undermines efforts to encourage cooperation and the development of incident management programs.

Having identified the problems, the TRI study then looked at specific management incident programs in five metropolitan areas and developed these findings:

-Incident management programs are cost effective. It is estimated that Chicago returns about $17 in benefits for each $1 invested in the program.

-There are real world models for developing and implementing effective comprehensive incident management programs. Chicago, Los Angeles, Fort Worth, Minneapolis and New York City all have programs, that can serve as useful models for other cities.

-Incident management programs are developing new tools and techniques for incident management. The development of electronic traffic controls and programs for the dissemination of traffic information show great promise for incident management efforts.

Finally, the TRI study developed a series of recommendations for federal, state, local and even motor carrier initi-atives. At the federal level, the study recommended the following:

-Enacting legislation supporting incident management as a national transportation priority.

-Funding to the states for the development or expansion of comprehensive incident management programs.

-Directing FHWA to focus research demonstration and training efforts on incident management.

-Develop methodologies for the uniform measurement and reporting of recurring congestion, incidents and the congestion impacts of incidents.

Mr. Chairman, that concludes my statement. I would be happy to respond to any questions you or the Committee may have.

UNITED STATES HOUSE OF REPRESENTATIVES

PUBLIC WORKS AND TRANSPORTATION COMMITTEE

Norman Y. Mineta, Chairman

Hearing Testimony

July 5, 1990

San Jose, CA

by

Craig Philip, PhD.

Vice President - Intermodal Division

Southern Pacific Transportation Company

Testimony for Craig Philip

I. INTRODUCTION.

My name is Craig Philip. I am Vice President - Intermodal Division of the Southern Pacific Railroad. The SP system includes 15,000 miles of rail routes and about 22,000 employees in 15 states. We are the largest railroad in California, with 6,377 miles of track and over 9,500 employees.

I would like to express today the Southern Pacific's deep concern with the possibility that the 1991 highway bill will authorize the operation of longer, heavier trucks--so-called longer combination vehicles, or LCVs. Among the LCV combinations being sought by the trucking industry are triple 28' combinations and twin 48s.

You have heard in your Washington hearings from the Association of American Railroads (AAR), our national trade association, that LCVs are literally a matter of life or death for the railroad industry.

For a railroad like the Southern Pacific, the LCV threat is, if anything, even more ominous than for the railroad industry as a whole. Unlike some eastern roads, Southern Pacific does not carry a lot of bulk traffic, insulated from truck competition. Instead, our chief line of business is rail intermodal. We provide the long

haul service for containers and trailers that would otherwise be carried on the highways. Accelerated competition from longer and heavier trucks would take this traffic off the SP and put it on the roads. It is very doubtful that the SP could survive if this were to happen. The consequences for the California transportation system would be disastrous. Not only would the state lose an important part of its rail service, but, in an era of already severe highway congestion, truck traffic would soar. Imagine the half a million containers per year at the ICTF here in Long Beach moved suddenly and permanently onto California's freeway system.

II. SAFETY, POLLUTION AND ENERGY CONSUMPTION WOULD ALL SUFFER AS TRAFFIC MOVED FROM RAIL TO TRUCK.

Safety: Railroads are more than three times safer than current combination trucks on a fatalities per ton-mile basis (Exhibit I). Diverting freight from truck to rail inevitably, therefore, increases accidents on the transportation system as a whole.

And multi-trailer trucks are even less safe than existing combinations. The most recent Federal Highway Administration study found that, on eleven key handling, performance and efficiency criteria, the 1985 study triples performed "much worse" than conventional single 48s on six and "somewhat worse" on a seventh. Twin 48s were "much worse" on five of the eleven; the same on three; and better on only three.

Both accident statistics and public perceptions bear out the FHWA's concerns.

On a fatal accident per vehicle mile travelled (VMT) basis, multi-trailer combinations (including the more common twin 28s as well as LCVs) are significantly less safe than conventional tractor trailers (Exhibit II). Their fatality rate is 5.8 deaths per 100 million miles, while single trailer combinations are responsible for 4.8 deaths per 100 million miles travelled. (Passenger vehicle death rates are 3.4 per 100 million miles).

And in California, where twin 28 double trailer operations are more widespread than in the rest of the country, doubles are involved in 83 percent more fatalities per mile than are single-trailers: a fatality rate of 9.6 deaths per 100 million miles (Exhibit III).

Doubles are particularly dangerous, even more so than conventional combinations, to the passenger vehicles with which they share the highway.

* In 1988, heavy combination trucks were involved in highway accidents that killed 620 heavy truck occupants and 3,781 others--a 6:1 "kill ratio" (Exhibit IV);

* When only collisions between heavy combination trucks and

passenger vehicles are considered, there are 29 others killed for each heavy combination occupant who dies (Exhibit V);

* But when multi-trailer combinations and passenger vehicles collide the "kill ratio" is 45 others killed for each multi-trailer occupant killed (Exhibit VI).

Public attitudes on the wisdom of legalizing LCVs are consistent with the dismal safety record of current multi-trailer combinations.

Eighty-six percent of the public believes that longer trucks would be less safe than current combinations, according to a recent opinion poll on public attitudes toward higher truck sizes and weights, conducted by Frederick/Schneiders Incorporated for the Association of American Railroads (Exhibit VII).

Pollution and Energy Consumption: LCVs raise serious environmental questions, in addition to their effect on safety.

In fact, increased reliance on environmentally superior rail transportation could alleviate the growing environmental problem generated by rapidly rising levels of truck traffic.

For example:

1. Railroads produce far less air pollution than trucks per ton-mile of freight moved, and the relatively self-contained nature of rail facilities tends to lessen other pollution problems (Exhibit VIII).

2. Compared to truck, railroads are nearly three times more fuel efficient (Exhibit IX).

III. DESPITE THE RISKS OF LCVS, THE TRUCKING INDUSTRY AND THE HIGHWAY LOBBY ARE ALREADY MAKING CLAIMS, THAT, IF ACCEPTED AT FACE VALUE, POINT TO A TRUCK SIZE AND WEIGHT LIMIT INCREASE.

The fact that these claims are false has not stopped either interest group from making them.

First, the truckers claim that any increase in truck diesel taxes justifies increases in truck size and weight limits. Second, some highway construction interests and media commentators argue that very large fuel tax increases are necessary to meet highway infrastructure needs. Clearly, these two propositions, if accepted and acted upon, would dictate increased truck size and weight limits.

But in fact:

IV. TRUCKERS ALREADY HAVE A BETTER DEAL THAN OTHER HIGHWAY USERS AND CERTAINLY LACK ANY RIGHTS TO SPECIAL INDUCEMENTS FOR ACCEPTING A HIGHWAY FUEL TAX INCREASE.

A. To Begin With, Heavy Trucks Are Already Imposing Massive Costs On Other Highway Users.

Heavy truck user charge payments are insufficient to pay for the highway damage occasioned by heavy trucks. Consequently, other highway users, such as automobiles and lighter trucks, face an unpalatable dilemma: they can pay more than their fair share of highway costs, or watch as highway quality falls because of inadequate funding. In recent years they have typically experienced some of both.

The problem is substantial. The U.S. DOT has estimated that heavy trucks are paying only about two-thirds of their fair share of federal highway costs. Numerous state studies document the existence of a comparable state-level problem.

The heavy trucks are, therefore, the most favored class of highway users.

B. And A Fuel Tax Increase Would Only Improve The Heavy Trucks' Relative Position.

Per dollar of fuel tax paid, heavy trucks cause much more highway damage than do automobiles. So raising fuel taxes to fund highway repairs actually increases the subsidy from automobile drivers to heavy trucks.

C. *Compare The Positions Of The Two Categories Of Highway Users.*

Consider first automobiles and lighter trucks.

* Because of heavy trucks' underpayment, they pay more than their fair share for subpar highways.

* A fuel tax increase requires them to pay even more in excess of their fair share in exchange for the promise of improved highway quality.

* They are offered no special inducements to offset the costs of increased fuel taxes.

* And they must confront a new generation of truck behemoths, degrading the highway environment and offsetting any roadway improvements.

Contrast this position with the proposal crafted by the heavy truck operators for themselves:

* Their current subsidy is preserved and even increased.

* Their slightly higher fuel tax payments are "leveraged" by a large new infusion of revenue from lighter vehicles, revenues for improving the highways on which the heavy trucks depend.

* In exchange for deigning to pay a pittance more, heavy trucks are to be bribed with a huge increase in lengths and weights.

But even this contrast does not show the full extent of the audacity of the truckers' proposal. To see that requires a glance at recent trends in per-mile heavy truck highway user charge rates.

V. IF 1988 FUEL TAXES FOR BOTH TRUCKS AND AUTOS HAD RISEN JUST ENOUGH TO RESTORE REAL TAX RATES TO 1984 LEVELS, ANNUAL HIGHWAY REVENUES WOULD HAVE INCREASED BY $3.1 BILLION.

A. Between 1984 And 1988, Fuel Economy Gains And Inflation Diminished Real Dollar Federal Diesel Tax Payments By 17.9 Percent For The Typical Rail-Competitive Truck (Exhibit X).

In 1984 the typical rail-competitive truck paid 2.8 cents/mile in federal fuel taxes. By 1988 the effective fuel tax rate had

fallen by almost 18 percent, to 2.3 cents/mile (inflation alone eroded fuel taxes by 11.2 percent).

Inflation and fuel economy gains also affected highway taxes paid by automobiles, further reducing the growth in highway revenue.

B. If 1988 Federal Per-Mile Fuel Tax Rates Alone Were Restored To Their 1984 Levels, Total Highway Tax Revenue Would Have Been $3.1 Billion Higher.

If adjusted for inflation and fuel economy gains, the 1988 federal diesel fuel tax rate would have risen from 15 to 17.9 cents/gallon. The federal gasoline tax rate would have increased from 9 cents/gallon to 11.4 cents/gallon (Exhibit XI).

Total highway tax revenue (including state and local government) would have been $72.1 billion, rather than the $69 billion actually collected in 1988.

VI. IF 1984 REAL DOLLAR PER MILE FUEL TAX RATES ARE RESTORED AND MAINTAINED, THEN CONTINUING RECENT TRENDS IN HIGHWAY TAX REVENUE GROWTH WOULD PRODUCE AND SUSTAIN THE HIGHWAY SPENDING LEVELS RECOMMENDED BY THE AMERICAN ASSOCIATION OF STATE HIGHWAY AND TRANSPORTATION OFFICIALS (AASHTO).

A. *Even AASHTO Believes That Fairly Moderate Highway Spending Increases Are Adequate.*

AASHTO has suggested that real national highway spending be $80 billion annually (1987 dollars) through the year 2020 in order to maintain the current national highway system. According to AASHTO, real spending of $100 billion annually would not only maintain the current network but allow for its expansion and improvement.

B. *Continuation Of Recent Trends Would Be Enough To Achieve These Spending Targets.*

Traffic growth, combined with increases in state highway tax rates, has been generating a 3.2 percent average annual real increase in highway tax revenues. This rate of increase could be combined with the $3.1 billion increase obtainable by restoring 1984 real dollar federal highway tax rates. The result would be to rapidly reach AASHTO's spending targets.

To illustrate, consider what would have happened if 1988 per-mile federal highway tax rates were equivalent to 1984 levels. Assuming 3 percent real growth in highway revenues were to prevail in subsequent years, revenues would reach the $80 billion target in 1992. Annual spending would reach even the $100 billion level by 2000.

Hence, perfectly adequate highway spending levels are within reach. All that is necessary is for the federal government to restore per mile tax rates to 1984 levels.

Indeed, something even less than that would probably suffice. The federal Highway Trust Fund had an unspent balance of about $10 billion in the highway account at the end of 1989. Spending this money for what it was intended to do, build highways, would further ease the task of generating new highway revenue.

The notion that the highway system's financial health demands swingeing new federal tax increases is pure fantasy.

Two conclusions, therefore, stand out:

* Restoring per-mile diesel fuel taxes to 1984 levels should not obligate the Congress to legalize yet another generation of bigger trucks. The heavy truck operators are already enjoying a very cushy deal at the expense of other highway users. They should not have to be enticed into accepting the same modest fuel tax increase required of everyone else.

* And, at most, a moderate fuel tax increase is all that is needed. Restoring fuel tax levels to those of 1984 is perfectly adequate to reach the AASHTO spending targets.

And those targets would be reached even earlier if the federal government could be forced to disgorge the Highway Trust Fund revenues that it is currently hoarding.

Such a program of, at most, a modest tax increase, would preserve the integrity of the highway system while avoiding the dangers associated with a truck size and weight increase. California, and the nation, would continue to enjoy the safety, environmental, and economic benefits of a balanced transportation system.

TESTIMONY TO THE HOUSE COMMITTEE ON
PUBLIC WORKS AND TRANSPORTATION
SUBCOMMITTEE ON SURFACE TRANSPORTATION
SAN JOSE, CALIFORNIA
July 6, 1990

Presented by
BILL PINE, Grays Harbor County Commissioner
Representing the
(Washington) Coastal Highway Coalition
2109 Sumner Avenue, Suite 202
Aberdeen, Washington 98520

Thank you Mr. Chairman and members of the committee for this opportunity to testify today. My name is Bill Pine and I represent the Coastal Highway Coalition in Washington State. The Coalition is composed of members representing counties, cities, ports, economic development councils, transit authorities, planning organizations and others interested in an improved Highway 101 Corridor.

The coastal counties of Washington are facing major impacts to their local economies due to recent environmental decisions. While the former mainstays of our economies are in trouble, coastal Washington acknowledges a shift in the economic focus is needed. We are actively pursuing economic diversity but geologic, economic and social isolation from the major centers of population and commerce hamper our efforts to provide for the future.

Coastal Washington supports a number of communities with diverse weather and different social and economic bases. The common thread between these communities is Highway 101. It is the lifeline in a region removed from the main population center. Improved transportation with the emphasis on providing for all user needs and the enhancement and protection of scenic, historic, recreational and natural resource attributes would increase economic diversification in the region and provide better and more safe access to areas preserved for all citizens.

We believe any planning and improvements to the 101 Corridor should be done in terms of Pacific Coast, not just Washington State. The Coastal Highway Coalition supports the efforts of the Tri-State Highway 101 Council on behalf of improved transportation planning and projects based on the concept of 101 as a single entity.

Last year, Congress directed the Federal Highway Administration to conduct a National Scenic Byways Study calling for the development of guidelines for a National Scenic Byways Program. We are enthusiastic about the potential such a program may have for Highway 101 in California, Oregon and Washington.

The coastal communities in Washington have long relied on their incredibly diversified natural resource base as a source of raw materials for harvest on a sustained yield. With the declining harvest of the mainstays of our economy, namely fish and timber, it is time for the Washington Coast to shift the use of its natural resources in other directions. Tourism, alternate forest products, environmental research, international trade, aquaculture, aerospace manufacturing, marine services, furniture manufacturing and other industries not based on traditional forest products offer the greatest potential for economic growth and diversification. Most of these industries are also highly dependent on good transportation routes and easy access to distribution and raw material markets. The infrastructure must be there for diversification to occur. Current transportation problems threaten to stifle any strides taken toward the brass ring of economic and social survival.

Because of our natural resources, the economic development potential, especially in tourism, is enormous. The Washington coastal region represents a unique and diverse environment. Average rainfall varies from 160 inches per year in the Hoh Rain Forest to 12 inches a year in Sequim. The Olympic National Park, the fifth most visited in the country, is the centerpiece of coastal Washington while the Columbia River, the Pacific coast, the Strait of Juan De Fuca and the Hood Canal frame the amazingly diversified portrait of mountains, glaciers, protected bays and marshes, wide sandy beaches and forbidding wild rocky coastlines that provide a myriad of recreational opportunities.

In our county alone, we have a protected estuary of 100 square miles, seven state parks, five wildlife refuges and habitat management areas, and portions of the Olympic National Forest and Olympic National Park.

Thousands of visitors come to the area every year. The result is a dangerous situation. Chip and log trucks intent on quickly reaching a destination mingle with RV's, bicycles and local traffic with different intentions and driving pace. The roads are mostly two-lane and often twisting with few opportunities for passing or separation of traffic.

Scenic overlooks with pullouts are few, rest areas non-existent, and accidents numerous.

Around Lake Crescent, it is common practice for truckers on 101 to radio each other and warn about cyclists on the roadway. Last year, Highway 101 supported 882,000 Park visits to Lake Crescent alone, or 25 percent of the total Park visits.

Despite limited and hazardous access, the Olympic National Park was visited by 3.36 million people in 1989. Total overnight stays totalled 412,000. The Park is preparing to meet increased use due to the sprawling growth next door in Puget Sound. In order to meet the growing demand and attract more visitors to the area, an improved highway corridor is needed.

With a National Scenic Byways program we could accommodate the growing amount of traffic - including RV's, cyclists and tour buses - along with the heavy industrial traffic and local traffic. All these uses mingle on a winding highway that is predominantly two-lane with few passing opportunities and numerous hazards.

A Scenic Byways Program may also help insure the preservation of the scenic and environmental qualities that make the Pacific Coast a world-class attraction. The only concern we might have with the program would be if the guidelines precluded communities from the development of their road system or other diversification opportunities. When the Federal Highway Adminsitration submits its report to Congress in November, we hope the Committee will review the guidelines with this in mind.

Washington is committed to an improved 101 Transportation Corridor. The Washington State Department of Transportation plans to spend over $150 million in the area during the next six years. A concept plan for Washington's 101 Corridor is currently being developed. The plan will take a comprehensive look at the highway as a whole and develop a strategy and approach for future planning and improvements.

But current efforts are not enough. No mechanism exists for addressing the entire Pacific Coast system and exploring the possibilities in a comprehensive way.

We agree with Oregon that the Federal government has a role to play here. In order to advance a multistage effort, federal leadership is needed in defining, designating, coordinating and planning scenic highway corridors that address a geographic region rather than being fragmented by political lines. We join Oregon in recommending the Committee review the National Scenic Byways Study with this role in mind. Thank you. I'll be pleased to answer any questions the committee may have.

Testimony of
Val Selivanov, M.D.
Director of Trauma Services at Stanford University Hospital
and Associate Professor of Surgery at Stanford University
and
Andrew McGuire
Executive Director of The Trauma Foundation
Board Members of
Citizens for Reliable and Safe Highways
(CRASH)

House Public Works and Transportation Committee
Surface Transportation Subcommittee
San Jose, California -- July 5, 1990

Mr. Chairman, we are pleased and honored to have this opportunity to testify before the Subcommittee on the subject of highway safety.

We are both involved daily in trauma care and prevention.

Dr. Val Selivanov is a trauma surgeon who did research in trauma and burn injuries at the National Institutes of Health. Until two weeks ago, Dr. Selivanov was Associate Director of Trauma at the San Jose Medical Center. Since June 15 he has been Director of Trauma and an Associate Professor of Surgery at Stanford University Hospital.

Andrew McGuire is Executive Director of the Trauma Foundation at San Francisco General Hospital. He has been directly involved in numerous injury prevention issues including burn prevention, drunk driving (former Board Member of Mothers Against Drunk Driving), motorcycle helmet laws and mandatory seatbelt laws. He is also a film maker who won an Emmy for his first film. He is a Lecturer at UCSF and at Johns Hopkins University.

I. NEED FOR PREVENTION

Those of us who work in trauma are frustrated with how little we can do for trauma victims. Even though the trauma surgeon is the last great hope of trauma victims, once their bodies are smashed, there is relatively little we can do for them.

A serious involvement in trauma care thus leads one to an interest

in injury prevention. The focus of prevention is to make the environment safer. We both worry, however, that Congress might make the highway environment more dangerous by authorizing triple trailer trucks and twin 48-foot trailer trucks.

II. CRASH

Our focus on injury prevention prompted us to join the Board of Directors of Citizens for Reliable and Safe Highways (CRASH), a national coalition whose goals are to prevent injuries from truck crashes and reduce highway congestion.

CRASH's injury prevention efforts are focused in four areas:

1. Preventing crashes caused by driver fatigue;
2. Preventing crashes caused by poor truck maintenance;
3. Preventing crashes caused by alcohol and drug abuse; and
4. Preventing crashes that would occur if triple trailer trucks or twin 48-foot trailer trucks were authorized.

Since the trucking industry is already committed to pushing Congress for approval of triples, we are working on this issue first. This statement gives some of the reasons we believe triples are unsafe.

III. ENGINEERING STUDIES

An impressive body of engineering studies lead to the conclusion that triples are inherently unstable and unsafe. Since neither of us is an engineer, however, we will leave a discussion of those studies to others.

IV. FLAWED ACCIDENT STUDIES

The engineering studies lead one to conclude that double trailer trucks are less safe than single trailer trucks and that triples are even more dangerous than doubles. One would therefore expect accident rate studies to confirm the engineering studies.

Instead, conflicting studies abound. Some conclude that double trailer trucks have a better accident rate than single trailer trucks. Some conclude that doubles have only modestly worse accident rates than single trailer trucks.

We do not purport to be experts in accident rate study methodology nor even to have read all relevant studies. Nonetheless, we are aware of expert opinion that concludes that those studies are flawed for a variety of methodological and data shortcomings.[1]

The most serious flaw was the failure of the researchers to ensure that the double trailer trucks and the single trailer trucks that were being compared had been operated on similar roads.

Double trailer trucks are driven predominantly on the relatively safe limited access and divided highways of the interstate system.

---

[1] In addition to the methodological flaw discussed by us in our statement, we note the following criticisms of those studies which others have levied:

a. Double trailer trucks are generally found in the fleets of large less-than-truckload (LTL) companies who have relatively good maintenance practices and the most qualified and experienced drivers. This leaves a pool of less qualified, less experienced drivers for single trailer trucks. The worst alcohol and drug abusers, fatigued drivers and dangerously maintained trucks tend to be found in the fleets of the smaller truckload companies that, by and large, tend to have fleets of single trailer trucks. These factors raise the accident rates for single trailer trucks.

b. Where double trailer trucks are broadly used (as in California) their fatal accident rates are much higher than those of single trailer trucks.

c. A number of studies are based on Bureau of Motor Carrier Safety statistics. These data are voluntarily reported by carriers and have been found to be extremely unreliable.

d. Police accident reporting forms frequently do not distinguish between single trailer trucks and double or triple trailer trucks. Often, the forms contain only a write-in section on trailer configuration. These factors make accurate reporting dependent on the investigating officer's efforts to write down detailed information. Thus, many doubles accidents are counted as single trailer truck accidents.

e. Vehicle mile travelled (VMT) data are limited and often inaccurate.

Single trailer trucks are driven a much larger percentage of time on the far less safe state and suburban highways and on city streets. Since the accident rate on state highways is five to seven times the accident rate on interstates, comparing accident rates for doubles and single trailer trucks without controlling for the road travelled is like comparing apples and oranges.

V. DOUBLES OVER-INVOLVED IN ACCIDENTS BY FACTOR OF 2-3

We have reviewed a study by Stein and Jones[2] which carefully controlled for type of road. The study concluded that double trailer trucks were over-involved in accidents by a factor of 2-3.

This study is so important that we wish to summarize it in depth.

A. TIME AND PLACE

The study was performed in Washington State over a two-year period from June 1984 through July 1986 primarily on Interstate 5, which runs north-south, and on Interstate 90, which carries east-west traffic. The Washington State Patrol collected the data.

B. TYPES OF TRUCKS

Washington allows the following kinds of trucks:

Single Unit Truck
Tractor
Tractor-Trailer
Truck Trailer
Western Double (twin 28's)
Rocky Mountain Double

Figure 1 -- Truck Configuration. Note: Western doubles were defined as a tractor with two trailer units with the first trailer 35 feet or less in length; nearly all had two 28-foot trailers. Rocky Mountain doubles were tractors hauling two trailers with the

[2] Stein and Jones, "Crash Involvement of Large Trucks by Configuration; A Case-Control Study," American Journal of Public Health, May 1988, Vol. 78 No. 5.

first trailer greater than 35 feet in length; the majority had a first trailer of 40 feet with second trailers of various lengths.

C. METHODOLOGY

The study included all crashes involving trucks with a gross vehicle weight rating greater than 10,000 pounds that occurred on Interstates 5 and 90 and involved personal injury or at least $1,500 of property damage.

Each crash-involved truck was inspected by a state patrolman.

One week after each crash the state patrol conducted a random roadside truck inspection at almost the identical site where the accident occurred. Three comparison control group trucks were randomly selected: one approximately 30 minutes before the time of the one week earlier crash, one at approximately the exact time of the crash, and one 30 minutes after the time of the crash.

The study analyzed 604 large trucks involved in crashes. Three times that number (1,812 trucks) were randomly inspected for the comparison control sample.

The purpose of the randomly selected comparison control sample was to determine (by a random selection process akin to the public opinion polling process) the relevant population for each truck configuration. In other words, the researchers determined that 59% of trucks that were on the same interstates where the accidents occurred were single trailer trucks, 6% were twin 28-foot trailer trucks, 1% were Rocky Mountain doubles, 5% were straight trucks pulling a trailer, 23% were straight trucks with no trailer and 5% were tractors only, with no trailers (bobtails).

D. RESULTS

By comparing the "exposure" percentages of each configuration in the control group (i.e., that configuration's percentage of the total relevant truck population) with the percentage of total crashes in which each configuration was involved, the researchers determined whether a particular configuration is over or under-involved in crashes:

	Single Unit Truck	Tractor only (Bobtail)	Tractor-Single Trailer	Twin 28's	Rocky Mtn. Double	Truck Trailer	Total
Crash Involved	8%	4%	59%	18%	3%	9%	604
Comparison Control Sample	23%	5%	59%	6%	1%	5%	1,812

As would be expected, single unit trucks (which have no articulation joint) had the best record. They were involved in only 8% of the crashes, but made up 23% of the relevant population. Single unit trucks were thus under-involved in crashes by a factor of almost three. That is, they had only one-third the number of accident involvements one would expect if their accident involvement were (on a percentage basis) equal to their percentage of the total population.

Tractors pulling one trailer were neither under nor over-involved. They were involved in 59% of the crashes and made up 59% of the total population.

Twin 28's, however, were over-involved by a factor of three. They were involved in 18% of the crashes, but only made up 6% of the relevant truck population.

Rocky Mountain Doubles were also over-involved by a factor of three. They were involved in 3% of the crashes, but only made up 1% of

the relevant truck population.

Single unit trucks hauling a trailer were over-involved by a factor of almost two. They were involved in 9% of the crashes, but made up only 5% of the total population.

Thus, the authors conclude that doubles (i.e., twin 28's, Rocky Mountain doubles and truck-trailers) are over-involved in crashes by a factor of two to three.

These results can be depicted graphically as follows:

VI. CALIFORNIA HIGHWAY PATROL STUDY[3]

Stein and Jones are not the only researchers to find doubles over-involved in accidents. A one-year study of tank truck crashes by the California Highway Patrol suggests double tank trucks are substantially more dangerous than single trailer tankers.

Tank truck accidents are extraordinarily severe. The number of persons killed per tank truck crash is four times the number killed per

[3] W.M. Heath, Chief Engineer, "California Tank Truck Accident Survey," California Highway Patrol, 1981.

casualty accident for other types of truck crashes.

Rollovers of tank trucks are particularly dangerous.

The proportion of fatal accidents in tank truck rollover accidents are more than double the proportion of fatal accidents in tank truck accidents not involving rollover.

Ninety-five percent of the persons killed in tank truck accidents were in rollover accidents. Sixty-two of the persons injured in tank truck accidents were in rollover accidents.

Spills occurred in 79% of the overturns and in only 16% of the non-overturn accidents.

Double trailer tank trucks had a significantly greater proportion of crashes involving overturns than did single trailer tank trucks: tank straight trucks and tractor single trailers overturned in 50% of their crashes; straight trucks pulling a single trailer overturned in 60% of their crashes; and tank trucks with double trailers had overturns in 70% of their crashes.

Of particular importance were the number of doubles crashes involving overturns of the last trailer:

> The last trailer in a set of doubles was particularly susceptible to overturn. The rear trailer was the only vehicle that overturned in almost two-thirds of the overturns involving sets of doubles and in close to half of the overturns involving trucks and full trailers.

It is likely that these accidents involving overturn of only the second trailer would not have occurred had the involved tractor been hauling only one trailer.

VII. UNIVERSITY OF MICHIGAN STUDY[4]

A study of the huge double trailer tank trucks used in Michigan is particularly significant since the vagaries of the federal grandfather clause which is part of the federal truck weight statute allows Michigan to run tank trucks that weigh as much as 165,000 pounds and look like this:

The researchers concluded that these double trailer trucks "should not be permitted to operate on the Michigan highway system for reasons of public safety."

VIII. AS TRUCKS GET HEAVIER, ACCIDENTS BECOME MORE SEVERE

It is intuitively obvious that if truck weights are increased from 80,000 pounds (which is the current limit with some exceptions) to 135,000 pounds, truck crashes involving passenger cars will result in more deaths and more severe injuries.

The data supports this intuitive conclusion.

When a car collides with another vehicle, what happens to the occupants is worse if they hit a heavy car and many times worse if they hit a truck.[5]

A study of 1977 truck crashes in Maryland found that one out of 80 crashes involved a fatality. For cars, the ratio is only one out of 400.

An analysis of fatalities reported in NHTSA's Fatal Accident

---

[4] Ervin et al., "Ad-hoc Study of Certain Safety-Related Aspects of Double-Bottom Tankers," Highway Safety Research Institute, University of Michigan, 1978.

[5] L.S. Robertson and S.P. Baker, "Motor Vehicle Sizes in 1,440 Fatal Crashes," Accident Analysis and Prevention, Vol. 8, pp. 167-175, 1976.

Reporting System and FHWA's adjusted state vehicle mile traveled data shows that multi-trailer trucks (i.e., twin 28's, Rocky Mountain doubles, truck-trailers and triples) in 1988 had involvement in 23% more fatalities per mile of travel than single trailer trucks.

We note, however, that multi-trailer trucks are relatively new for most of the country. Except in California, where doubles have been widely used for decades, doubles use tends to be limited to larger companies with better maintenance practices and better drivers.

It is therefore instructive to note that in California, where double trailer truck use is more widespread, double trailer trucks are involved in 83% more fatalities per mile than are single trailer trucks.

This data suggests that as doubles use becomes more widespread and is no longer limited to large, careful companies, accident rate records of doubles and single trailer trucks become more comparable and the

innate instabilities of doubles identified in the engineering studies become more evident in the accident rate record.

It is well known that passenger car victims are more likely to die in car/truck crashes than the truck driver. In 1988 combination trucks were involved in highway accidents that killed 620 truck occupants and 3,781 others -- a 6:1 ratio.

Many of the truck drivers died in single vehicle accidents not involving passenger vehicle occupants. When only collisions in 198' between combination trucks and passenger vehicles are considered, there are 29 others killed for each truck occupant killed.

The greater severity of double trailer truck accidents becomes apparent when only collisions between multi-combination trucks and passenger vehicles are considered: 45 others are killed for every truck occupant killed.

We emphasize that almost all of the multi-trailer trucks referred to above were twin 28-foot doubles weighing only 80,000 pounds. If triples weighing 115,000 pounds or twin 48's weighing 135,000 pounds are permitted nationwide use, the severity of those accidents should increase dramatically.

IX. MULTIPLE VICTIM ACCIDENTS OVERLOAD EMERGENCY ROOMS AND TRAUMA CENTERS

We believe the data indicate that congressional authorization of triples or twin 48's will result in many more multiple victim crashes.

Dr. Selivanov has personally experienced the near catastrophic consequences of multi-victim accidents overloading our emergency room and trauma center capacity.

We sincerely hope that Congress will act to prevent those accidents from ever occurring. We, therefore, urge the Subcommittee to resist the

trucking industry's efforts to force longer and heavier truck on our nation's roads. It is, after all, a matter of life and death.

Mr. Chairman and members, I am Jim Spering - Mayor of Suisun City in Solano County, member of the Metropolitan Transportation Commission, Vice-Chair of the Policy Advisory Committee for the joint MTC/SACOG Strategic Transportation Planning Study.

I believe Helen Thomson has summarized the thrust of the study very well.

Let me add just these few thoughts.

The study opened the door for some new thinking by all of us involved - suggesting that the time is right for breaking new ground in the reauthorization bill as well. Further the reauthorization should provide program incentives to stimulate further thinking about new opportunities for solving our transportation problems.

We opened an inter-regional dialogue that was very healthy. This suggests to me that state and local governments can build on the past planning partnerships to create even more productive future ventures.

And finally, our study finds the need for a strong and continuing federal program - but clearly recognizes that we must carry our own local load as well - the threat of ever increasing congestion on a few federally adopted routes is all too clear. Every partner must bear his share in devising a broader based solution.

Thank you for providing this opportunity to review the results of this strategic planning study.

TESTIMONY PRESENTED TO THE SUBCOMMITTEE ON SURFACE TRANSPORTATION OF THE PUBLIC WORK AND TRANSPORTATION COMMITTEE U.S. HOUSE OF REPRESENTATIVES

BY

KATHERINE A. STREHL
MANAGER OF GOVERNMENT AND COMMUNITY RELATIONS
LOCKHEED MISSILES & SPACE COMPANY, INC.
P.O. Box 3504; 24-01/101
Sunnyvale, CA 94088-3504

SAN JOSE, CALIFORNIA
July 5, 1990

Chairman Mineta and Members of the Committee, thank you for the opportunity to provide testimony to the Subcommittee on Surface Transportation. My name is Katherine Strehl and I am the Government and Community Relations Manager of Lockheed Missiles & Space Company. We appreciate these regional hearings on the Reauthorization of the Post-Interstate Surface Transportation program---it is a topic of vital concern to business in California.

At the outset, let me say that Santa Clara County has consistently supported transportation. Voters have taxed themselves to fund transit and highway improvements, providing roughly $200 million per year in local funds. And most recently California voters approved a package (including doubling the state gas tax) that will provide nearly $20 billion in transportation funding over the next 10 years. Still, it is not enough. With California's population increasing each year by some 700,000 new residents our transportation infrastructure simply cannot keep pace with anticipated growth.

For a company like Lockheed, this is **not** an inconsequential matter. With 23,000 employees located in Santa Clara County, Lockheed Missiles & Space Company is the largest industrial employer in Northern California. Our employees commute from all parts of the region--from Sacramento and Sonoma Counties to San Bonito and Monterey (and everywhere in-between). Given the shortage of affordable housing in proximity to jobs, our employees are moving out to the Central Valley and beyond. For instance, 260 Lockheed employees live in Sacramento and San Joaquin Counties, facing one way commutes of 90-120 miles and up to three hours.

It is fair to say that transportation is a critical issue for this and other companies in Santa Clara County. It affects our ability to recruit and retain qualified labor **and** to remain competitive in the national and international market place. Importantly, **the transportation issue is now inextricably linked to environmental quality.** Under the mandates of the California Clean Air Act, the Bay Area must reduce auto emissions by roughly 35% in the next seven years to meet State air quality standards.

To achieve these standards businesses will be asked **(if not required)** to implement comprehensive ridesharing programs for their employees. Lockheed has had such a program in place since the energy crisis of the early

'70s. While I won't detail the particulars of the program, it is fair to say that it is considered to be a successful, full-service program that has served as a model. In spite of a substantial investment of resources and personnel, however, Lockheed's ridesharing participation rate stands at 25%--a long way from the 35% to be required by State law. We are hopeful that the Bay Area will be able to avoid the regulatory approach adopted by Southern California in its effort to meet federal and state air quality standards. But, to do so, we need all of the help we can get.

The Post-Interstate national program can help in a variety of ways. Specifically:

* * **Continue and increase federal funding** -- Current and future funding sources at the local and state level simply cannot keep pace with the increased demand for transportation facilities. Federal investment in California's transportation infrastructure is a critical element in sustaining this state's economic vitality. Without such investment there is little hope that we will reduce congestion and achieve air quality standards.

* * **Adopt federal funding guidelines which allow for regional planning and implementation of transportation priorities** -- No two states have identical transportation funding needs. Similarly, regional needs vary widely throughout this state (and the nation). Federal funding should **not** dictate regional priorities. Rather, the national agenda should be broad enough to allow metropolitan, urban areas to tailor their transportation program to meet the area's specific needs..

* * **Establish national programs which provide maximum funding flexibility** -- Regions should be encouraged to take a "systems" approach and spend federal dollars according to the area's needs, regardless of mode or ownership. Taken together, it is interstate and state highways, local arterials, bus and rail transit operations and a regional network of HOV lanes and Park and Ride lots that constitute the transportation **"system."** Categorical funding rewards one element of that system over another...at the expense of the whole.

* * **Enact federal policies which promote and reward intra- and inter-regional cooperation** -- Commuters do not recognize jurisdictional boundaries when travelling on a roadway, be it an interstate, state highway or local arterial. Federal policy should ensure that regions coordinate their transportation plans. National policy should also ensure coordination (rather

than competition) between transit agencies in all aspects of their operations (routes, transfers/linkages between systems, marketing, public information, maintenance and fare structures).

* * **Implement national policies which provide incentives to reduce congestion and vehicular emissions** -- Achieving air quality standards requires the full participation of both the public and private sectors and employers and individuals alike. To foster that participation, federal policy should provide a comprehensive package of incentives. Tax credits for employer investment in commute alternatives will demonstrate a partnership with government and encourage greater private sector participation. These incentives are particularly important for smaller companies which employ the majority of commuters. Similarly, tax laws should provide greater incentives to commuters. For instance, a larger portion of an employee's transportation subsidy should be excluded from income tax calculations than what current law provides. In addition, federal policy should address the liability concerns private employers face when sponsoring commute programs.

I would now like to shift gears and give an example of the importance of federal funding to regional planning. The **Tassman Corridor Study** is of enormous importance to the South Bay. Light rail in this corridor will connect with the Guadalupe Light Rail and eventually with BART in the East Bay. The project will provide an essential link between housing located in South San Jose and in Alameda and Contra Costa Counties with jobs located in the northern part of Santa Clara County. The Tassman Corridor project, as well as expansion of the BART system on both sides of the San Francisco Bay, cannot happen soon enough and requires federal funding to bring them to fruition. Without sufficient federal funds, our efforts to reduce congestion and improve air quality will be crippled. I should confess that there is some self interest in this project as it will directly serve many of the 23,000 Lockheed employees.

Again, I would like to thank you for the opportunity to comment on future federal transportation policy. We hope that you will call upon us in the future as you continue this deliberation.

REMARKS OF HELEN THOMSON
YOLO COUNTY SUPERVISOR
CONCERNING THE RESULTS OF

SACOG/MTC STRATEGIC TRANSPORTATION PLANNING STUDY
AND INDICATIONS FOR NATIONAL POLICY

THURSDAY, JULY 5, 1990

HEARING OF THE SURFACE TRANSPORTATION SUB COMMITTEE,
HOUSE COMMITEE ON PUBLIC WORKS

Good day. I am Helen Thomson, a Supervisor in Yolo County and the Chair of the Policy Advisory Committee for the joint MTC/SACOG Strategic Transportation Planning Study.

This joint study involved representatives of two regional planning organizations and local elected officials from six counties along the Interstate 80 Corridor. Representatives from three Districts of the California Department of Transportation were also on the Policy Advisory Committee.

While major concerns for congestion were expressed by representatives of the western and central portions of the corridor, the representatives of the eastern portion of the corridor expressed concerns for air quality improvement as well. In the end, air quality emerged as a primary objective.

Our study made it clear that many improvements will be needed over the next twenty-five years if potential congestion and environmental problems are to be mitigated. The study discusses over $7 billion in improvements throughout the corridor - well beyond presently projected transportation resources, even considering California's recent successful initiatives doubling the fuel tax and authorizing $3 billion in mass transit bonding. It is clear that the additional funds must be raised at all levels - local, state and federal - each jurisdiction has a role to play in sustaining the quality of life that our citizens have come to expect.

The needs will not be met with additional funds alone. The funds must be applied in the most cost-effective manner to meet our objectives. This means that we must be able to apply funds to projects based upon achieving desired results - not upon arbitrary categorical programs or to achieve the best federal/local matching ratio. In order to accomplish this, federal funds should have consistent matching ratio requirements and should be able to be used upon highway capacity, parallel arterial, or mass transit projects based upon results achievable. The key word describing this approach is "flexibility".

The results should be focused upon the problems being addressed, for example, urban and suburban congestion and air quality. Measurement of results then would become a necessary capability, and for this reason, a legitimate focus of federal concern. Developing the means to reduce vehicle emissions, to evaluate the air quality impacts of transportation projects, and to identify the most effective approaches to the variety of transportation problems we face should be the focus of federally funded research and development activities.

Finally, if we at the local level are to be partners with the state and federal governments in financing transportation facilities and services, we will have to make programming decisions with confidence. The funding levels and the rules regulating the appli-cation of funds must be predictable. Transportation projects are characterized by very long decision processes. A major transportation improvement will span several budget cycles and, often, many funding partners' budgets. Predictable federal programs will assist in long term commitments at the state and local level.

In closing, we recognize that maintenance of our considerable investment in transportation systems and facilities is a basic priority. This existing system is the basis upon which we build improvements which, together with what we now have, will address the needs of the next two or three decades. This is our advice to you for a new federal program: adequate funding, flexibly applied, and focused upon results. This is what the 21st century will demand.

I. INTRODUCTION

In the 1988 Department of Transportation Appropriations Act, Congress directed the U.S. Department of Transportation to conduct the National Strategic Transportation Planning Study (NSTPS). The study will provide Congress with information and recommendations concerning the federal government's role in meeting the nation's future transportation needs.

This study provides an opportunity to address Congress on certain important issues that will be considered in the early 1990's:

- the role of the federal government in financing future transportation improvements once the 43,000 mile interstate highway system is completed, somewhere around 1991; important issues concern the extent of federal involvement in maintaining and expanding the highway system; the need to increase the federal gas tax; the need to reshape current programs to better address future mobility problems; and obstacles that current programs create for making good investment choices; and

- the system of highway, transit, arterial, and traffic management improvements that will best serve economic and mobility needs in the corridor in the year 2015.

The San Francisco-Sacramento urban complex was chosen as one of five case studies, with a focus on the long-range transportation issues within the approximately 100 mile I-80 corridor that links these two regions. Within this corridor is a diversity of land uses and development, including the following:

- the northern end of the San Francisco-Oakland-San Jose urban complex, the fourth largest metropolitan area in the country (the southern end of the corridor is anchored by the busiest freeway interchange in the country outside Los Angeles);

- sparsely settled farming areas in eastern Solano and Yolo counties, undergoing increasing development pressures;

- the medium-sized Sacramento metropolitan area, rapidly growing in part due to its strategic crossroads location at the junction of I-80, I-5, and numerous state freeways;

- old Sierra mining communities such as Auburn, which are developing a second life as they fall within the growing Sacramento commutershed.

These areas are served by a wide array of transportation systems, from state highways and local arterials to BART and the new Sacramento light rail system (RT), to express bus service into the Bay Area and Sacramento, ferry service from Vallejo to San Francisco and intercity AMTRAK passenger service. A number of public transit systems also operate up and down the corridor.

The study is a cooperative regional planning effort among the Sacramento Area Council of Governments (SACOG), the Metropolitan Transportation Commission (MTC), and the California Department of Transportation (Caltrans). This study arrangement is somewhat unique in that it involves joint problem definition and resolution by a diverse set of governments with a common transportation bond--the I-80 Corridor. Land use decisions in one jurisdiction will have ramifications throughout other parts of the corridor, creating a common set of interests for all participants.

The Policy Advisory Committee (PAC), consisting of five members appointed by MTC, five members appointed by SACOG, and three Caltrans representatives, was created to oversee the study. The primary responsibilities of the PAC were to review and comment on work in progress and the direction of the study, and recommend objectives and alternatives to enhance the study's responsiveness to the transportation concerns within the study area. A Steering Committee, consisting of representatives from SACOG, MTC, and Caltrans, was responsible for coordinating and managing the study.

The main body of technical work on the study was conducted by DKS Associates of Oakland, California. During the course of the study, four working papers were presented to the Policy Advisory Committee:

- Background and Issues
- Demographics and Economics
- Transportation Forecasts
- Evaluation of Alternatives

A Final Report, prepared by the consultant and based on the information and data presented in these working papers, provides a background of technical information and study details that support the conclusions presented in this Summary Report.

II. DESCRIPTION OF CORRIDOR

Figure 1 illustrates the regional setting of the STPS study area. The study focuses on the I-80 corridor between the San Francisco-Oakland Bay Bridge and Auburn in Placer County. Figure 1 also shows the three segments into which the corridor was divided. The segmentation allowed the study to focus on critical issues within different areas of the corridor, as well as to identify issues (such as air quality) that were of concern throughout the study area. Brief descriptions of the segments of the corridor are presented below:

Western Segment: This segment, stretching from the Bay Bridge to the Carquinez Bridge, is the most heavily developed portion of the corridor. Through here, I-80 carries its highest traffic volumes. Although some additional growth is expected to occur, primarily north of Richmond, the segment is projected to have the lowest rate of growth of any portion of the study area over the next 25 years.

Figure 1

I-80 Corridor Study Area and Segments

38-253 O—91——85

Central Segment: This segment incorporates all of Solano County, plus a small undeveloped portion of Napa County. Solano is currently undergoing a metamorphosis from rural to urban/suburban, as growth pressures from the Bay Area (and, to a lesser extent, Sacramento) result in increasing residential and commercial development in this portion of the Corridor. Currently, the major urbanized areas are Vallejo, at the northern end of the Carquinez Strait, and central Solano County. Eastern Solano County, from Vacaville to the Yolo County line, is the most sparsely developed portion of the I-80 Corridor.

Eastern Segment: This segment includes much of the Sacramento metropolitan area, from the City of Sacramento itself, to booming suburban locales such as Rocklin and Roseville, to more distant communities, such as Auburn, just beginning to enter the Sacramento commutershed. Like the Central Segment, this portion of the Corridor is expected to experience rapid growth between 1985 and 2015, particularly in Placer and Sacramento counties at the east end of the Corridor.

Growth projections for different regions of the Corridor indicate the likely pressure points on the year 2015 transportation system (See Chapters III and IV of the Final Report). The most rapidly growing portion of the Corridor will be in Placer and Sacramento counties in the Eastern Segment, followed by Central/Eastern Solano County. The Western Segment will have a relatively low rate of growth. Commute traffic is expected to increase most heavily in the high growth areas of western Placer County (221%) and central/eastern Solano County (127%). The smallest percentage increase will occur in northwestern Alameda County (29%). Much of the commute traffic will be local; employed residents in one section of the corridor are most likely to work in that section. Outside of local commutes, the main commute direction will be to the southwest in the morning (into job centers in San Francisco, Oakland, Berkeley, and Sacramento) and northeast in the afternoon. Yolo County is the exception to this general pattern, with morning commute traffic traveling east to Sacramento. Additional traffic impacts will be discussed in the Evaluation of Alternatives section which follows.

Planning Issues and Objectives

Planning issues in the I-80 corridor are as diverse as the land use and development patterns described earlier. Several of the more prominent issues are:

- lengthening commute periods, resulting in congested portions of I-80, particularly in the Western Segment, for much of the day from dawn to dusk;
- a transportation network which because of traffic loads is increasingly sensitive to accidents and other traffic "incidents" which can create significant back-ups and delays;
- increasing recreational and truck traffic which adds to the normal commute period traffic load on I-80;
- increasing congestion of local roadways, connecting to the freeway which, in some cases, serve as reliever routes for short trips that would normally use the freeways;
- uncertainty of funding support from federal and state sources, particularly after the current federal highway act expires in 1991.

In order to provide a framework for dealing with the large number of planning issues in the Corridor, a set of 10 planning objectives was developed and submitted to the Policy Advisory Committee. The Committee subsequently added improved air quality as an objective to reflect the potential role transportation decisions could have on air quality standards.

The Committee's action was based on the recognition that neither the Bay Area nor Sacramento Metropolitan Area are in compliance with the national ambient air quality standards for ozone and carbon monoxide. Air quality planning in California is currently being directed by the recently passed California Clean Air Act (Sher, AB 2595). This Act requires the air quality districts in California to develop air quality plans to achieve and maintain State and federal air quality standards. (The state standard for both ozone and carbon monoxide are more stringent than the federal standard.) The State Act further directs that the local air quality plans contain transportation control measures that address emissions from mobile sources. These control measures frequently emphasize ridesharing programs, HOV facilities, and expansion of local transit systems as a means to reduce automobile emissions. Development of transportation improvement proposals for the I-80 corridor must therefore be considered in the context of air quality objectives in addition to the transportation objectives.

Committee members then ranked the objectives in each segment according to their relative importance. Two objectives - maintaining the existing system and improving system safety - were judged to be "givens" in that Caltrans' policy is to provide adequate resources for maintenance and for safety improvements before considering capacity enhancements. Three objectives - improving air quality, managing travel demand, and managing freeway/street operations - were ranked as primary objectives in all three segments. A complete list of the objectives, including associated strategies and their relative rankings, is presented in Table 1. Because of the study's focus on the future federal role in transportation funding, the table also describes for the first time the Post-Interstate funding implications of the objectives and strategies.

Following the development of objectives and strategies, specific highway, transit, and arterial projects were listed that would help achieve these objectives. The following section describes the process and results of testing these projects for efficiency and effectiveness in handling the projected year 2015 traffic congestion.

TABLE 1
Objectives And Strategies

Objectives	Strategies	Relative Importance of Objective by Segment*	Post- Interstate Funding Implications
1. Improve Air Quality	o Reduce vehicle miles traveled o Reduce vehicle hours of delay o Reduce vehicle trips o Encourage ridesharing and transit use	Primary Objective in all Segments	Motor vehicle emissions contribute to air pollution problems to varying degrees in different locations in the I-80 corridor (in the Sacramento area 60 to 70% of emissions are from motor vehicles). Federal transportation programs should include ridesharing and transit support. Flexibility to direct more resources into these programs should be available so areas with severe air pollution can address this problem. More federal support is needed in the areas of research and planning. There is limited federal financial support to assist the planning efforts of local communities as they attempt to respond to federal standards and sanctions. Federal research of alternative transportation technology and clean fuels needs to be increased.
2. Maintain Existing Interstate/ State Highways, and local streets and roads	o Provide adequate funding for resurfacing, restoration and reconstruction (3 R) o Provide adequate state and local funding for maintenance o Adopt improved maintenance strategies	Primary Objective in all segments	There has been a major federal commitment to build the interstate system. A continuing federal investment to sustain and rehabilitate this system should have a high priority in a post-interstate program. State funding for maintenance should continue to have a high priority. Local maintenance is significantly under-funded and should be addressed on a statewide level.

*Objectives were ranked by the Policy Advisory Committee:

NOTE: P = Primary Objectives were those judged to be of major importance to the corridor segment.
S = Secondary Objectives were those judged to be of moderate importance.
L = Least Important Objectives were those judged to be of less importance within the context of this study.

TABLE 1

Objectives And Strategies

Objectives	Strategies	Relative Importance of Objective by Segment	Post- Interstate Funding Implications
3. Improve Highway Safety	o Construct essential safety projects (i.e., median barriers, widened shoulders, striping, etc.)	Primary Objective in all Segments	Federal, state and local guidelines for project selection should continue to address safety improvements. The federal government could encourage these projects only through continued involvement in a highway program.
4: Manage Travel Demand	o Promote ridesharing and provide support services o Implement employer flextime programs o Provide park and ride lots at appropriate locations o Designate company transportation coordinators o Promote Telecommuting	Primary Objective in all Segments	Federal programs should be flexible enough to support local ridesharing efforts, particularly those of areawide ridesharing agencies. Federally sponsored research could evaluate the potential telecommuting has for resolving congestion and air quality problems.
5. Manage Highway and Street Operations	o Implement Transportation Operation System (TOS) strategies o Ramp metering, with HOV bypass lanes o Provide HOV lanes	Primary Objective in all Segments	An increased level of State and Federal funding is required for operational projects which improve traffic flow on congested freeways. A new post-interstate program should allow for expanded application of these traffic management measures which provide a cost-effective alternative to constructing additional freeway capacity.

TABLE 1

Objectives And Strategies

Objectives	Strategies	Relative Importance of Objective by Segment	Post- Interstate Funding Implications
6. Improve commute to Metropolitan Areas/Relieve Gateway Congestion	o Provide/improve express bus service o Maintain/improve ferry services	Western: S Central: P Eastern: P	Operating expenses for express bus and ferry services should continue to be supported at adequate levels from a combination of federal, state and local programs.
	o Construct HOV (High Occupancy Vehicle) lanes		The optimum location for HOV lanes needs to be determined on a system basis and not piece-meal, depending on the availability of federal and state funding for certain categories of freeway. A new post-interstate transportation program should provide required flexibility to integrate HOV lanes where they make the most sense for congestion relief.
	o Widen freeways and bridges o Improve alternate routes		A comprehensive congestion relief program could entail widening existing freeways and bridges or developing alternative routes that may be a more cost-effective investment. Under the present program of categorical funding there is limited opportunity to develop alternative routes.

TABLE 1

Objectives And Strategies

Objectives	Strategies	Relative Importance of Objective by Segment	Post- Interstate Funding Implications
6. Improve commute to Metropolitan Areas/Relieve Gateway Congestion (Cont'd)	o Extend transit service to urban fringe		The bulk of the transit financing for new rail projects comes from UMTA's Section 3 Rail Mod/New Starts Program. This program is partially funded by a penny of the 9¢ federal gas tax. Consideration should be given to merging funding for major transit and highway investments which could lead to better corridor investment decisons.
7. Improve System Interconnections	o Upgrade interchanges to interconnect local street system and freeways o Improve arterials to provide better interconnections o Integrate park and ride lots with corridor express bus and carpool services o Integrate feeder bus and rail systems	Western: S Central: P Eastern: S	An investment in one part of the system should be coordinated with investments on other parts so that the system works together. This investment strategy require flexibility in the use of funds irrespective of system ownership. Definition of a metropolitan transportation system will assist in coordinating investments.
8. Facilitate Traffic Traveling Through Entire Corridor	o Designate and upgrade appropriate local arterials and transit systems to relieve freeways of short distance commute trips o Widen Freeways o Upgrade interchanges o Ugrade alternate routes o Install auxiliary lanes o Improve rail service	Western: S Central: P Eastern: S	Designation of major local arterials and expressways as part of a new metropolitan transportation system could direct future transportation funds to local facilities which relieve adjacent freeways. Transit system upgrades could also pull short trips off of freeways. Existing federal categories would have to be changed to permit this flexibility.

2677

TABLE 1

Objectives And Strategies

Objectives	Strategies	Relative Importance of Objective by Segment	Post- Interstate Funding Implications
9. Support Local Development	o Connect new activity centers with improved arterial/expressway systems o Provide new and improved interchanges to connect new development to freeway systems where consistent with local land use decisions o Expand local transit services	Western: S Central: L Eastern: S	There should be a continued federal interest, and therefore, a continued federal transportation program, to support urban and rural economic and mobility needs. Existing categorical funding impedes coordination of federally assisted transportation programs with local development decisions. Similarly, state programs should encourage better linkages between development decisions and state investment.
10. Improve Service for Goods Movement	o Implement operational improvements for truck traffic o Construct intermodal transfer facilities (truck to rail) in Bay Area and Sacramento o Improve rail freight facilities o Implement truck to barge service o Improve alternate routes	Western: L Central: S Eastern: S	The movement of goods is largely a private sector activity, but this activity benefits from public investment in highways, port facilities, and airports. Capital investments in the highway system to expedite truck travel, improve safety of freeways for truck operators and develop safety standards for trucks and their drivers should be encouraged in federal transportation programs.
11. Facilitate Recreational Traffic	o Upgrade facilities at "bottlenecks" o Identify and improve alternate routes o Improve bus service to recreational areas o Improve rail service to recreational areas	Least Important Objective in all Segments	Though considered as a "Least Important Objective" in the Corridor, this objective would be aided by post-Interstate strategies requiring greater flexibility in the use of funding.

III. TRANSPORTATION OPTIONS FOR 2015

Definition of Alternatives

Traditional corridor studies evaluate the effect of proposed transportation improvements on corridor mobility by forecasting future traffic and comparing traffic conditions under a range of improvement scenarios. This corridor study followed the same process by postulating different combinations of highway/ highway operations, transit, arterial upgrade, and travel demand management strategies for further analysis. The alternative components were then developed to form complementary and mutually supportive multi-modal measures in a "systems" approach. The principal ordering of alternatives relied on the Policy Committee's assessment of the relative importance of various objectives as discussed earlier. None of the alternatives represents a preferred strategy in and of itself; rather they are intended to measure differences in corridor mobility given increasingly more capital-intensive solutions to the transportation problem evidenced in year 2015 (e.g. travel demand management and highway operations strategies are initially evaluated followed by more extensive investment in new rail lines and freeways which would be necessary to alleviate chronic congestion).

The performance of each of the following alternatives was compared against the performance of the 2015 "Base Case" system -- which assumes completion of projects included in the current 5 year State Transportation Improvement Program (STIP).

- Alternative 1 was designed to meet the objectives of primary importance for each segment of the Corridor, as described above. Improving air quality, managing travel demand, and managing freeway/street operations were emphasized in all three segments, with additional objectives included in the Central and Eastern segments.

- Alternative 2 included all objectives and projects from Alternative 1, and added those projects that satisfied secondary objectives in each segment.

- Alternative 3 provided an opportunity to determine the incremental effects of additional capital investment, particularly in the Central and Eastern segments.

- Alternative 4 added further capital investments; this alternative represents the most comprehensive and intensive set of transportation projects evaluated for the I-80 Corridor.

Several of the transportation projects embodied in the alternatives, particularly new freeway proposals, have the potential to reshape and redirect regional growth patterns in the corridor. Although local governments exert control over land use adjacent to these new facilities, there will undoubtedly be pressure for development once such facilities are constructed. This study did not address the issue of whether or not additional traffic would be "induced" by these facilities, although a number of Policy Committee members felt that this would be the case.

Evaluation of Alternatives

The alternatives were evaluated and compared to the 2015 Base Case according to a number of criteria: impacts on freeway levels of service (LOS) and travel time, changes in High-Occupancy Vehicle (HOV) use, reductions in congested miles on freeways and arterials, changes in transit use and transit travel times, impacts on air quality as measured by reductions in Vehicle Miles Traveled (VMT) and Vehicle Hours of Delay (VHD), and other environmental impacts. Capital and operating/maintenance costs were also developed for each alternative. Transportation conditions and proposed improvements vary considerably among segments; therefore, impacts of each alternative were analyzed on a segment-by-segment basis; major findings of this analysis are presented in Table 2, and described briefly below (See Chapter VI of the Final Report):

Western Segment:

- o I-80 west of Route 4 will continue to be heavily congested (LOS "F") under all alternatives for the peak hour, but congestion will lessen at other hours; the worst periods of congestion will not last as long.

- o Ridesharing to work would increase by at least 5900 carpoolers under all alternatives, due to the new HOV lanes, but some of this increase would be drawn from transit users as well as people who drive alone.

- o Total transit use by residents of the Western Segment would not increase significantly with commuter rail service or extensions of BART, as this segment is already well-served by transit. However, more Solano County residents would be traveling into or through the Western segment by transit.

- o Under Alternative 4, total vehicle delay would be reduced by one-third, the largest reduction of any alternative. This reduction would largely be due to the high levels of transit service (commuter rail, BART to Solano County) that would remove a significant number of Solano County vehicles from I-80.

Central Segment:

- o Much of I-80 between Vallejo and Fairfield will continue to experience LOS "F" under all alternatives, but traffic east of Fairfield, and particularly east of Vacaville, will become less congested under all alternatives. Despite poor peak hour service levels, vehicle delay and travel times will decrease substantially, due to a shortening of the duration of congestion in this segment of the corridor.

- o Carpooling would increase substantially (4200-7500 new carpoolers) under all Alternatives except 4; BART to Fairfield would draw off new carpoolers in the latter alternative.

- o Transit usage would increase steadily from Alternative 1 to Alternative 4, with a large increase in Alternative 3 (BART to Vallejo) and another increase in Alternative 4 (BART to Fairfield).

Table 2
SACOG/MTC STRATEGIC TRANSPORTATION PLANNING STUDY
Summary - Evaluation of Alternatives (as Compared to Year 2015 Base Case)

WESTERN SEGMENT

	Alternative 1	Alternative 2	Alternative 3	Alternative 4
Objectives	Serves Primary Objectives: • Improve air quality • Manage travel demand • Manage freeway & street operations	• Expand on Alternative 1 to achieve primary and secondary objectives.	• Same as Alternatives 1 & 2 plus adds new facilities	• Most capital intensive, adds remaining candidate projects.
The System				
Freeways	I-80: Replace westbound span of Carquinez Bridge			Construct Route 84 freeway between Sunol and Antioch
HOV Lanes	I-80: Bay Bridge to Carquinez Bridge I-680: Willow Pass Rd. to Benicia-Martinez Bridge			
Arterials	San Pablo Avenue upgrade			
Transit	• Express bus service from Solano County • Upgrade Vallejo ferry service	• BART to Hercules • Commuter rail between Sacramento and Oakland	• BART to Vallejo	• BART to Fairfield
TOS	Ramp metering south of Carquinez Bridge			
Environmental Analysis				
Air Quality	• Reduces VMT 4% and VHD 16% • potential reductions in emissions	• Reduces VMT 4% and VHD 17% • potential reductions in emissions	• Reduces VMT 7% and VHD 23% • potential reductions in emissions	• Reduces VMT 12% and VHD 34% • potential reductions in emissions
Other	• No major impacts	• BART to Hercules: • possible displacements of homes/businesses	• BART to Vallejo: • possible displacements of homes/businesses • possible impacts on wetlands	• Route 84 Freeway: • possible displacements of homes/businesses • potential for induced growth
Transportation Analysis				
Freeways	• Reduces VHD by 15% • I-80 LOS "F" except north of Route 4 • Auto travel time decreases 16 min - Bay Bridge to Carquinez Bridge	• Reduces VHD by 16% • I-80 LOS "F" except north of Route 4 • Auto travel time decreases 20 min - Bay Bridge to Carquinez Bridge	• Reduces VHD by 22% • I-80 LOS "F" except north of Route 4 • Auto travel time decreases 17 min - Bay Bridge to Carquinez Bridge	• Reduces VHD by 33% • I-80 LOS "F" except north of Route 4 • Auto travel time decreases 20 min - Bay Bridge to Carquinez Bridge
HOV	6,600 new carpoolers (6.7% increase)	5,900 new carpoolers (6.0% increase)	6,000 new carpoolers (6.1% increase)	6,900 new carpoolers (6.6% increase)
Arterials	• Reduces VHD by 18% • Congested lane-miles reduced 22%	• Reduces VHD by 18% • Congested lane-miles reduced 22%	• Reduces VHD by 30% • Congested lane-miles reduced 23%	• Reduces VHD by 35% • Congested lane-miles reduced 23%
Transit	• 106,600 total daily commuters • 18.1% share • No change in Oakland to Vallejo travel time	• 107,700 total daily commuters • 18.2% share • No change in Oakland to Vallejo travel time	• 107,700 total daily commuters • 18.2% share • 12 min less travel time Oakland to Vallejo	• 107,700 total daily commuters • 18.2% share • 12 min less travel time Oakland to Vallejo
Funding Requirements

SACOG/MTC STRATEGIC TRANSPORTATION PLANNING STUDY

Summary - Evaluation of Alternatives (as Compared to Year 2015 Base Case)

EASTERN SEGMENT

	Alternative 1	Alternative 2	Alternative 3	Alternative 4
Objectives	Seven Primary Objectives • Improve air quality • Improve mobility to Metro areas; relieve growth congestion • Manage travel demand • Manage highway & street operations	• Expand on Alternative 1 to achieve primary and and secondary objectives.	• Same as Alternatives 1 & 2 plus adds new facilities	• Minor capital enhance. adds widening roadway projects
The System				
Freeways			• Construct Route 102 from I-80 east of Auburn to I-5 near airport • Widen I-5: airport to Woodland • Widen 113: I-80 to I-5	• Extend Route 102 across Yolo Bypass to I-80 (with no widening of Rt. 113) • Widen Rt. 51: E St. to I-80 • Construct Beltway (beyond from I-80 near Roseville to Route 113 near Davis)
HOV Lanes	I-80: Add HOV lanes from Davis to Hwy. 50 and from I-5 to Roseville	• Extend HOV lanes from Roseville to Loomis	• I-5: Add HOV lanes from Route 102 to I-80	
Arterials	• Widen Roseville Road • Widen Auburn Boulevard • Widen Elkhorn Boulevard		• Widen Stanford Road • Widen Elverta Road • Extend Truxel Road across I-80 to downtown	• Extend Roseville Rd. from Harrison Ave. to Richards Blvd. crossing
Transit	• Extend LRT to Antelope • Upgrade/extend express bus service from Davis, Woodland and Auburn to Sacramento	• Extend LRT to Roseville • Commuter rail service from Oakland and Auburn to Sacramento	• Extend LRT to North Natomas and West Sacramento	• Extend LRT to Davis and Woodland
TOS	• Ramp metering on elevated freeways			
Environmental Analysis				
Air Quality	• Reduces VMT 6% and VHD 13% • Potential reductions in emissions	• Reduces VMT 7% and VHD 15% • Potential reductions in emissions	• Reduces VMT 5% and VHD 25% • Potential reductions in emissions	• Reduces VMT 9% and VHD 32% • Potential reductions in emissions
Other	Widening of arterials • possible displacement of homes/ businesses		Widen I-5 to Woodland • potential impacts on sensitive areas Route 102: potential for inducing growth LRT to North Natomas: • possible impacts on sensitive areas (bridge over American River and Parking)	Beltway freeway • potential for major displacement of homes/ businesses • possible impacts on sensitive areas • potential for inducing growth Route 51: potential for major displacement of homes/ businesses
Transportation Analysis				
Freeways	• Reduces VHD by 21% • I-80 LOS "F" Davis to Auburn • Auto travel time decreases 21 min. - Davis to Auburn	• Reduces VHD by 23% • I-80 LOS "F" Davis to Auburn • Auto travel time decreases 22 min - Davis to Auburn	• Reduces VHD by 26% • I-80 LOS "F" Davis to Hwy. 50 and I-5 to Auburn • Auto travel time decreases 33 min - Davis to Auburn	• Reduces VHD by 32% • I-80 LOS "E-F" I-5 to Auburn • Auto travel time decreases 46 min - Davis to Auburn
HOV	10,600 new carpoolers (4.7% increase)	9,900 new carpoolers (4.4% increase)	7,000 new carpoolers (3.3% increase)	6,600 new carpoolers (2.9% increase)
Arterials	• Reduces VHD by 13% • Congested lane-miles reduced 1%	• Reduces VHD by 16% • Congested lane-miles reduce the same	• Reduces VHD by 26% • Congested lane-miles reduce the same	• Reduces VHD by 32% • Congested lane-miles reduced 7%
Transit	• 38,900 total daily commuters (13% increase) • 3.9% share	• 47,300 total daily commuters (17% increase) • 5.0% share	• 58,100 total daily commuters (27% increase) • 6.2% share	• 63,600 total daily commuters (29% increase) • 6.4% share
Funding Requirements				
Capital				
Freeway/Arterials	$135 million	$220 million	$700 million	$2,310 million
Transit	100	180	410	700
TOS	20	20	20	20
TOTAL	$250 million	$420 million	$1,110 million	$3,070 million
Annual Opr./Maint.				
Freeway/Arterials	$0.5 million	$0.6 million	$3.4 million	$4.1 million
Transit	3.6	4.8	5.7	6.8
TOTAL	$4.1 million	$5.4 million	$9.1 million	$10.9 million

- The transit extensions, HOV lane widenings, and ferry service upgrades in the Central Segment will help reduce vehicle miles of travel by 11-22% compared to the 2015 Base Case. Vehicle hours of delay will drop 46-64%, due to the transit, ferry and HOV improvements, the new Route 113 freeway, widenings of I-80 and I-680, and arterial upgrades.

Eastern Segment:

- Under Alternatives 1 and 2, I-80 would experience severe congestion (LOS F) in the peak hour from Davis to Auburn.

- In Alternative 3, congestion on I-80 would be reduced somewhat between Route 50 and I-5. In Alternative 4, due mainly to the Route 102 extension to I-80 and construction of the Beltway freeway congestion would be cleared between Davis and Sacramento and the duration of severe congestion between I-5 and Auburn would be lessened.

- In Alternatives 3 and 4, auto travel times decrease substantially due to Route 102, LRT extensions, and HOV lanes; the alternatives provide reductions in vehicle delay ranging from 21 to 33%.

- All alternatives would increase carpooling by at least 6600 new users; Alternative 1 would add 10,600 new carpoolers.

- Transit usage would increase substantially (37-43%) in Alternatives 3 and 4 with extensions of light rail to Roseville, North Natomas, West Sacramento, Davis, and Woodland, plus commuter rail service from Oakland through Sacramento to Auburn.

Despite the scale of transportation improvements envisioned in Alternative 4 -- approximately $7 billion in transit expansion, new freeways, HOV lanes, highway operational strategies and new reliever routes -- adequate levels of service are not achieved for much of the corridor. Rather, what occurs is a lessening of the duration of serious congestion which is reflected in the reduced vehicle delay hours. This situation has prompted the Policy Advisory Committee to note that additional solutions -- as yet undefined -- will need to be considered to address the growth in person trips and goods movement forecasted for 2015. Greater emphasis must be placed on land use decisions that ensure that transportation congestion problems are not exacerbated.

Definition of a "Systems" Approach in the I-80 Corridor

In order for the transportation "system" in the I-80 corridor to function in the future, different elements of the system must be linked together in a network that works for the system's users. In other words, the highways, major arterials, transit lines, intercity rail services, and transportation demand measures should be developed in a complementary and mutually supportive manner.

The evaluation of alternatives suggests some promising directions for future investment in the corridor, even though this investment would be insufficient to address the growth in travel projected to take place over the next 30 years. The key elements of an I-80 transportation strategy can be defined and specific projects selected to facilitate this strategy.

Western Segment. The Carquinez and Benicia bridges should function as "gateways" into the more heavily urbanized and congested portion of the Bay Area. Strong inducements for HOV formation should be provided at the bridge approaches such that vehicle occupancy is increased (e.g., HOV bypass lanes, toll free passage, etc.). South of the Carquinez Bridge ramp metering and improvement of San Pablo Ave. as a reliever arterial facility will enhance whatever I-80 upgrade design is ultimately implemented by CalTrans. The systems approach to this segment of the corridor also suggests that a range of transit options would be needed to best serve the commuter -- express buses from Solano County, BART extensions and/or commuter rail service upgrades in the I-80 corridor, and ferry services, such as the Vallejo ferry. The Carquinez Bridge and new Benicia Bridge should be designed to accommodate possible rail extensions, even if this occurs at a much later date.

Central Segment. The Central segment will continue to export commuters to job opportunities beyond its borders. Heavy local, truck and recreational traffic demand will add to peak period congestion on I-80, suggesting a need for a comprehensive arterial/reliever route network to allow local trips to avoid the freeway during peak traffic periods. A comprehensive flextime program for local employers, coupled with a Traffic Operation System (ramp metering and incident management), would also be extremely valuable in enhancing the performance of the I-80 facility. In the short term, express bus service to the metropolitan job centers in the Bay Area and Sacramento will be the most appropriate transit enhancement; the feasibility of commuter rail service between the Western and Eastern segments still needs to be addressed through the ACR 132 Auburn to San Jose Rail Corridor Upgrade Study. Intercity rail service between Sacramento and the Bay Area, if scheduled at the right times, could provide additional commute period transit capacity. Another potential system improvement would be the development of a new freeway/expressway/railway corridor linking Rt. 84 through eastern Contra Costa County with Rt. 113 in Solano County; this corridor would allow trips from the Bay Area to avoid the entire western portion of I-80 by traveling through Livermore, Antioch and Dixon.

Eastern Segment. The Eastern segment would initially consider a gateway strategy emphasizing HOV treatment at the Causeway from Davis to Sacramento. In addition, continuous HOV lanes and ramp metering would be provided along I-80 from Sacramento to Roseville and Rocklin, where rapid development is occurring and new residential areas are under construction. The traffic analysis shows the potential for reliever route development in the Sacramento area to accommodate local trips (Roseville Road, Auburn Blvd., Elkhorn Blvd.). Express bus service from Davis, Woodland, and Auburn and incremental LRT extensions to Roseville, North Natomas and West Sacramento would extend transit service to the metropolitan fringes and expand the market potential of the existing LRT system. Express bus service in LRT corridors would be directed to serve employment centers not directly served by LRT. Major new highway facilities, such as Route 102 and the Beltway freeway, were found to have a beneficial effect on corridor congestion in 2015 as compared to the Base Case, but raise other environmental and growth management issues which were not addressed during the limited timeframe of this study.

Projects that Complement the System

While this study did not fully evaluate specific transit and highway transportation projects in the corridor, the definition of the system approach described above can be used as a guide for project and program selection. Completion of this study represents just the first step in the long process of addressing transportation problems in the I-80 corridor. There is a need to continue efforts to see that specific recommendations are implemented and additional planning work is undertaken to examine issues that remain unresolved and pursue opportunities that were not fully explored during the course of the study.

Appendix A identifies projects that are committed for funding, and suggests projects that are "Promising" as well as projects "Needing Further Study". The "Promising" projects were assessed by the MTC/SACOG/Caltrans Steering Committee as being both consistent with the system corridor concept and logical candidates for implementation consideration. Also included in Appendix A is a list of projects that were not included in any of the alternatives because of their limited benefits to the corridor. These projects respond more directly to transportation problems in areas beyond the limits of the I-80 corridor.

Appendix B provides the rationale for including projects in one category or another. Further evaluation of these projects will be required before consensus can be fully achieved on how they should be categorized.

The Policy Advisory Committee recommended that criteria used to evaluate corridor level alternatives also be applied to the candidate projects. These criteria are listed in Appendix B and include both transportation and environmental assessments.

IV. FUNDING ISSUES

Growth and infrastructure must go hand-in-hand or corridor mobility will decline. Unfortunately, many local governments are relying on past investment in transportation infrastructure to serve new population and job growth because of shrinking transportation funding. In the long term, it will be essential to replenish transportation capacity in order to preserve mobility, retain existing jobs, and attract new jobs to the corridor. There are major threats to transportation funds that could further erode the funding base for future transportation improvements and frustrate local and regional transportation interests. However, this is also a time of opportunity to seek out new directions at both the federal and state levels. Funding concerns and opportunities are described below:

Concerns at the Federal Level

- Interest in using the federal gas tax (8¢ for highway and 1¢ for transit) for deficit reduction; this tax generates about $13 billion per year.

- A decline in federal obligational authority, resulting in a accumulated surplus in the Highway Trust Fund of about $10 billion; reduced obligational authority is used to control spending so that the "surplus" becomes a means to balance the federal budget.

- A 50% decline in federal formula funds (UMTA Section 9) to operate and maintain existing transit systems over the past 4 years.

- Rising construction costs which eat away at the purchasing power of the federal 9¢ per gallon tax.

- A 57% decrease in federal support for the nation's passenger rail system (AMTRAK) measured in constant dollars since 1978.

- A "categorical" approach to highway funding which restricts funds to certain "cookie jars"--Federal Aid Interstate (FAI), Federal Aid Primary (FAP), Federal Aid Urban (FAU), and Federal Aid Secondary (FAS). These categories channel federal dollars to certain types of facilities which may not be the most effective transportation improvement for a particular metropolitan or rural area. For example, federal priorities, particularly those associated with the Interstate system, have resulted in approximately 20% of California's annual federal funding allocation going to non-Interstate highways even through these highways constitute 70% of the States' total mileage.

Concerns at the State Level

- The current state 9¢ gas tax is inadequate to meet the needs of even a basic transportation program for the State. The current State Transportation Improvement Program (STIP), which has a total cost of $6.5 billion, is underfunded by approximately $4.5 billion.

- Like the federal 9¢ gas tax, the state tax is not designed to keep pace with inflation. The purchasing power of the state's highway program is approximately one fourth (1/4) what it used to be in the early 1970's.

- The states' shrinking resources are now almost exclusively dedicated to maintaining the existing state highway system and matching federal highway dollars with a major focus on completing the Interstate System within the State.

- State operating assistance for mass transit (the STA program) has all but dried up.

- State transit assistance for capital programs (TCI and Article XIX) is not increasing and is therefore being reduced in actual purchasing power due to inflation.

- California's highway financing crisis has resulted in the virtual cessation of planning activities necessary for advanced route determination and right-of-way protection.

Concerns at the Local Level

- The estimated annual cost of maintaining the corridor's existing and programmed major arterials is $6 million. This locally borne expenditure is only a fraction of the total cost, however, as portions of the corridor, Alameda and Placer counties in particular, have incurred large backlogs of deferred maintenance costs. Maintenance costs, in addition to those identified above, will be substantial as new projects are added to the corridor's arterial system.

- Subventions of 4.39¢ of the 9¢ state motor vehicle fuel tax are returned to counties and cities for the construction and maintenance of local arterials. Not only is this amount inadequate to meet current, deferred and anticipated needs, but the purchasing power of these revenues has been significantly eroded by inflation.

New Opportunities

The very factors that threaten highway and transit financing have also created a powerful consortium of public and private interest groups which see renewed transportation investment as the key to the future of the State. At the federal level, the Interstate Highway System will be completed by 1991, finishing a three-decade-long project to connect the nation's cities and rural areas. The near completion of this landmark system has generated extensive discussion about future federal involvement in transportation funding and the fate of the 9¢ federal gas tax. Groups such as the American Association of State Highway Officials (AASHTO), the American Public Transit Association (APTA), the California Transportation Commission (CTC), National Association of Counties (NaCO), and National League of Cities (NLC) are all formulating advocacy positions relating to a new federal transportation program. The Governor and various Legislators have proposed varying solutions to the States' financial transportation crisis.

This study suggests several basic concepts which would need to be embodied in new federal and state funding initiatives, in effect, principles of negotiation. These principles would be beneficial to the I-80 Corridor in that they would allow for continuing definition of transit and highway programs, and provide assurances that these programs would eventually fit into either a federal or state program at the appropriate time.

- The Case for Enhanced Revenues. Clearly the scale of the improvements envisioned in the Western, Central, and Eastern segments of the corridor (over $7 billion in Alternative 4) indicates the inadequacy of current federal and state gas tax revenues as a means of financing major new programs. As large as the capital outlays are for the I-80 Corridor, they would still be insufficient to eliminate congestion from the I-80 Corridor suggesting that even further improvements may be required to serve projected growth. If the I-80 Corridor is in fact a microcosm of other areas in the country, both the 9¢ federal gas tax and the 9¢ state gas tax must be increased by substantial amounts to hold any potential for seriously addressing this country's mobility needs. Increased gas taxes provide a double benefit--increasing revenues and moderating auto travel.

- The Case for Flexibility. Categorical programs need to change in recognition of changing travel demand, air quality concerns, and transportation solutions. Urban areas may need investments in non-Interstate highway projects and arterials that can relieve freeways when further highway expansion is impossible or the costs are prohibitive. Expansion of bus and rail transit (including commuter rail) systems may also provide a more logical and politically acceptable solution in some corridors when compared to alternative highway investments. Finally, federal highway funds are not available for traffic operation strategies (surveillance, message signs, ramp metering and improvements to local streets to accommodate ramp meters, etc.) which can maximize the capacity of existing facilities and smooth their operation. Overall, added flexibility will encourage the most-effective investments rather than the investments for which categorical funding is available.

  To promote good decision making and ensure that the flexibility produces the intended results, a further refinement should be considered in the federal program. This refinement would be to establish uniform local matching ratios for all programs so that investment decisions are not directed at achieving the most favorable match requirement, but rather are aimed at providing the most productive transportation investment for the corridor.

- The Case for Maintaining the Existing Transportation System. While the focus of most transportation studies is on capacity issues, a large and growing problem is occurring in the maintenance of the existing investment. This problem is well recognized by many cities and counties struggling to maintain their streets and roads, but it also applies to the State Highway System and to regional transit systems. For example, the cost to maintain the I-80 Corridor study's Base Case freeway system is estimated to be about $15 million annually ($8,000 per lane mile), and maintaining the existing and planned major arterials will cost about $6 million annually ($3,000 per lane mile). Transit operators face a similar predicament--they must allocate sufficient funds to replace worn out rolling stock and rehabilitate their systems at various intervals. Expansion of transportation systems will add to this base case maintenance burden.

  All parties, therefore, are in favor of placing some of the current gas tax revenues for highways in a separate fund in an amount adequate for necessary restoration, reconstruction, resurfacing and rehabilitation of the multi-billion dollar Interstate System. Likewise, the federal formula funding program for operating and maintaining public transit systems should be preserved and the burden shifted from the federal General Fund to a gas tax supported fund.

- The Case for Predictable Funding. Transportation programs are long-term, taking many years to conceive, plan and construct. Yet these plans are usually made in a financial vacuum in that a substantial portion of the needed funds may not be identifiable or the decision on the use of funds is influenced through a process outside local control. Therefore, in order to enhance the local budgeting and programming process, transportation funds should flow in a predictable manner, probably directed by a formula such as the current "county minimums" formulas which is used to provide each county with its fair share of highway funds.

- The Case for Expanded Local Funding. Increased local contributions to the transportation system have been much in evidence in recent years. This local government response has been concurrent with diminishing state and federal transportation commitments; however local governments universally view these new commitments as an augmentation rather than replacement of federal and state funds. This augmentation role will undoubtedly need to be pursued with even more vigor given the scale of transportation improvements necessary to make a dent in I-80 corridor congestion.

  New strategies to augment conventional transportation funding sources at the regional, county and city levels are also emerging. Three counties in the corridor, (Alameda, Contra Costa and Sacramento) have passed one-half cent sales tax increases in support of transportation; part of these sales tax revenues are returned to the counties and their cities to finance arterial maintenance costs. Portions of the revenue derived from recently raised tolls on the state owned Bay Bridges will be used to fund rail transit, ferry and bicycle facilities and new Carquinez and Benicia spans. A bond issue (AB 973, Costa) is being considered to expand rail service in the State, including service in the corridor. In parts of the state, roadway improvements are being financed from revenues derived from special assessment districts and from developer fees. Toll road strategies may be an appropriate means of funding new facilities under consideration in the corridor (e.g., Route 113, Route 102). Other funding strategies that may have potential to augment the transportation funding base include a regional gas tax, joint development/value capture arrangements, increased vehicle registration fees and vendor fees. (See Table 4 for listing of possible future funding options).

- The Case for Federal Funding of Research and Development to Improve Transportation Technology, Decision Making, and Environmental Quality. Given federal and state clean air violations in the corridor and automobile usage as the primary cause of these violations, the federal agencies responsible for transportation should fund research and development:
  1. cleaner fuels and other less-polluting technologies,
  2. tools to evaluate the air quality impacts of potential transportation projects,
  3. incentives to ensure coordination of transportation and land use decisions,
  4. other strategies to achieve federal air quality standards.

V. RECOMMENDATIONS AND NEW DIRECTIONS

The I-80 Corridor Strategic Transportation Planning Study provides a framework for recommending future directions for the federal transportation program; it also defines the next steps in the transportation planning process for the I-80 Corridor itself.

A Federal Transportation Program for the 90's

Formulation of post-interstate transportation policy should be based on common national, state and local interests. It should be shaped by the need to achieve six objectives:

- Maintain a strong federal commitment to transportation, including planning, funding, and research

TABLE 4

FUNDING CORRIDOR TRANSPORTATION IMPROVEMENTS

SYSTEM IMPROVEMENTS	CURRENT FUNDING SOURCES	FUTURE FUNDING OPTIONS
1. FREEWAYS/HIGHWAYS	Federal/State (gas tax)	o Increase gas tax
o Capacity (new facilities, (widenings, interchanges, etc)	o Federal Aid Systems (FAI, FAP, FAU, FAS)	o Federal/State flexible funding o Toll Roads
o Operational (auxiliary lanes restripping, etc.)	Local o County sales tax	o Toll roads
o HOV Lanes/Park-n-Ride Lots	o Special assessment districts	
o Traffic operation systems	o Developer fees	
o Maintenance	State (State Highway Account)	o Federal/State set-aside
2. BRIDGES		
o Construction/operation	State (tolls)	
o Maintenance	State (State Highway Account)	
3. LOCAL ARTERIALS	Federal (FAU)	o Federal/State flexible funding
o Construction/operation	Regional/Local o State gas tax subventions o County sales tax o Special assessment districts o Developer fees	o County sales tax where not currently imposed o Regional/County gas tax
o Maintenance	State (State Highway Account)	o County/City set aside
4. TRANSIT	Federal (gas tax, General Fund)	o Federal/State flexible funding
o Capital	o UMTA (Sections 3, 9) State (Fuel tax) o State Transit Assistance Program (STA) o Transit Capital Improvement Program (TCI) o Article XIX o Tolls o Bonds Regional/Local (taxes) o TDA (1/4¢ sales tax on gasoline) o County (1/2¢ sales tax, dedicated/undedicated) o Property o County/City general fund	o County sales tax where not currently imposed o Regional/County gas tax o Joint development fees
o Operating	Federal (General Fund) o UMTA (Section 9) State (fuel tax) o STA Regional/Local (sales tax) o TDA o County o Fares	o Federal/State set aside o County sales tax where not currently imposed o Regional/County gas tax o Joint development fees
5. RAIL	Federal (General Fund)	o Federal/State flexible funding
o Capital	o Amtrak State (fuel tax) o STA o Article XIX o TCI o Bonds Regional/Local (sales tax) o TDA o County	o County sales tax where not currently imposed o Regional/County gas tax
o Operating	Federal (General Fund) o Amtrak State (fuel tax) o STA o Fares Regional/Local o County sales tax	o Federal/State set aside

- Maintain a strong federal commitment to the development of new technologies, including alternative transportation technology and cleaner fuels, to mitigate transportation and air quality problems.

- Provide an equitable distribution of funds to ensure that the interstate system is maintained, and urban and suburban congestion and air quality problems are addressed. Although this study focused on urban and suburban commute congestion, and not rural needs, a federal program should also ensure that rural economic and transportation needs are met.

- Provide better decision making based on more predictable funding levels and flexibility in funding. This will allow the expenditure of funds based on transportation needs, rather than available categorical funding. Integrated decision making also requires that decisions on capacity expansion be tied to local decisions about land use and development and that decisions on maintenance and rehabilitation be tied to the owners and operators of the transportation system. Transportation investments should include those strategies which are consistent with local air quality plans and are designed to assist in achieving and maintaining state and federal air quality standards.

- Encourage cooperation at all levels of government in the planning and implementation of transportation improvements with the recognition that the funding of needed improvements is a shared responsibility.

- Encourage development of incentives in the federal transportation program for coordinating local land use and transportation decisions.

Specific principles recommended to achieve these objectives are as follows:

- Federal and State gas tax increases are needed to sustain and improve the national surface transportation system. These increases should be dedicated solely for transportation purposes.

- The surplus in the federal Highway Trust Fund should be expended and used to address the current critical transportation funding shortfall in the state.

- The Federal Government should have as its highest priority maintaining the Interstate System.

- The Federal Government should make a similar strong commitment to the maintenance and operation of the nation's public transit systems, including Amtrak.

- Federal and State funding should be predictable and distributed using equitable formulas.

- Federal transportation programs should support local efforts to mitigate air quality problems.

- Recognizing that coordinating land use decisions of area governments is the key to solving transportation and air quality problems, the federal program should assist local and state governments in expanding their capability to perform long range land use and transportation planning.

- A metropolitan transportation system should be defined through the existing federal, state and local partnership, and serve as the basis for future funding eligibility. System options should include freeways, expressways, major transit facilities, arterials, and operational improvements.

- Federal and state governments should encourage cost-effective investments by blending major transit and capital highway funding available for system expansion.

- Federal matching requirements should be uniform for investments in new or expanded highway and transit facilities, so as not to bias decision-making.

- Sufficient funds should be dedicated from local funding sources to adequately maintain city streets and county roads.

- Additional local funding initiatives should be pursued to augment federal and state sources, including county sales taxes, regional/county gasoline taxes, bonds, assessment districts, and developer fees.

Growth Management and Other Issues

- Growth Management. As this study clearly indicates, growth issues are surfacing as major determinants in the location and amount of transportation investment. Air quality concerns expressed by the Policy Advisory Committee are also traceable, in part, to the effect of growth rather than the effect of the transportation improvements. Given the transportation capacity "shortfall" in the year 2015, attention must be directed to the growth issue. This is a formidable task given the extent of the corridor and the number of separate city and county governments and agencies. Local governments do have it in their power to guide the scale and location of development, if not actual levels of growth. Development decisions that place housing, shopping and employment areas closer together; intensify land uses around transit lines; make offices and housing more accessible to transit service; and stage growth in concert with the provision of transportation services all have potential to improve transportation service. Integration of land use planning and transportation planning should be pursued throughout the corridor, but especially in the developing areas of the Central and Eastern segments. A flexible federal transportation program, as recommended above, will enhance local and regional agencies' ability to integrate land use and transportation decisions.

- Development of Local Arterial and Transit Systems to Complement Freeways. Certain portions of the corridor must rely almost exclusively on I-80 for their trips. As I-80 becomes more congested, particularly in high growth areas of the corridor (e.g., Solano County), a system of local arterials, expressways and transitways may provide an alternative for shorter, local trips. This system could link residential and employment centers and serve as a basis for co-development of transitways, open space, and industrial parks--both intensifying land uses and preserving open space where appropriate. In rapid growth areas, advanced planning and right-of-way protection for these systems will be essential.

- Recreational Travel. One of the significant congestion factors in the corridor is recreational trips that create weekend bottlenecks, especially at the bridges. This is a difficult problem and one which the study addressed only superficially. Strategies deserving consideration include special transit services (ski trains and buses) and more widespread adoption of flextime at places of work.

- Goods Movement. Like recreational trips, truck traffic creates problems for freeway traffic (chemical spills, accidents, etc.) that are not easily solved and that were not directly addressed in the study. The prohibition or regulation of trucks to reduce their presence on corridor freeways during peak periods would probably produce little overall improvement to the traffic flow. Other studies, such as the Urban Freeway Gridlock Study recently prepared for Caltrans, show the large amount of delay statewide caused by truck incidents. Strategies aimed at incident management and improvement in truck and driver performance should be pursued. Further work in this area should focus on the potential use of alternative modes for transporting freight. The concept of intermodal terminals at strategic locations, both within and outside the corridor, to facilitate the integration of freight collection and distribution by rail, truck, and barge is particularly worth pursuing.

- New Funding Sources. Previous sections of this report identified a number of non-traditional or unique funding mechanisms that emphasize "self help" or "local contribution". The extent to which a study proposal remains an unimplemented recommendation rather than a facility or service in place may depend on how successful efforts are to implement some of these funding strategies. Three such strategies would seem to have special appeal when considering funding needs in this corridor:

  - county sales taxes
  - toll roads
  - joint development/value capture.

  One of these strategies, raising county sales taxes by one-half cent to fund specific transportation improvements, already has been approved by the voters in Alameda, Contra Costa and Sacramento counties; it warrants consideration by the other counties in the corridor.

  Experience has shown, however, that not all counties have been able to pass local sales taxes for transportation purposes. Relatively rural counties (such as Placer County) may have a difficult time passing transportation sales taxes, or generating significant amounts of revenue through such taxes. In such instances, additional revenue sources must be pursued.

  The passage of SB 1403 (Seymour), which permits the construction of three toll roads in Southern California, has established a precedent for considering this funding mechanism in the I-80 corridor. Potential new freeways, such as Route 113/84 and Route 102, may be fundable employing some form of toll strategy.

Joint development/value capture arrangements, whereby tax revenues are generated from the joint use of a transit station site by both the transit operators and a real estate developer, have the potential to not only develop revenues for the operation of the transit service, but also to generate transit patronage. This strategy should be evaluated as plans to extend rail transit service are developed.

Building on the National Strategic Transportation Planning Study

What should be done next? This is the question usually faced at the end of an important planning study. Two areas of future activity should be highlighted:

- Support for a New Post-Interstate Federal Transportation Program. There will be increasing debate about the future federal transportation program as 1991 approaches. The principles of support as outlined in this study are sound and worth vigorously pursuing in the face of other interest groups which may argue for a different course of action. In particular, they offer corridor communities the opportunity to chart their own course with respect to the right mixture of transit, highway, HOV lane treatment and arterial improvement strategies. The flexible funding concept will not rule out any reasonable set of choices that address a particular transportation/environmental problem. Under a restructured transportation program a project emphasis will be replaced with a more deliberate and useful "systems approach" to corridor planning which will emphasize the ability of local decisionmakers to make land use, transportation and environmental/air quality decisions that are in the best interest of their communties.

- Further Corridor Project Definition. This study illustrates the difficulty of putting many complex and difficult decisions into the proper perspective within a short time frame. This is not a shortcoming of the study but a recognition of the complex process of relating transportation decisions to other important concerns -- growth, land use, the economy, and the environment. More time is needed to further explore the merit of individual projects in these contexts; to develop a corridor implementation plan; and to suggest financial planning that will complement the corridor strategy. Mechanisms to continue this consensus building process should be explored. The Policy Advisory Committee will stand ready to meet on call of the Chair to address issues that may be raised by SACOG, MTC, Caltrans, FHWA, or the Office of the Secretary of Transportation, or to assist Congressman Fazio as needed.

APPENDIX A

APPENDIX A

Suggested Project Categorizations

While this study did not fully evaluate specific transit and highway transportation projects in the corridor, the definition of the system approach described in Section III can be used as a guide for project and program selection. Completion of this study represents just the first step in the long process of addressing transportation problems in the I-80 corridor. The project categorizations presented below are suggested as a starting point in developing a program for the I-80 corridor facilities improvements. This breakdown reflects the results of the travel forecasts together with the professional judgement of the consultants and Steering Committee. Additional steps that will need to be taken with respect to these projects include environmental impact assessments, approval by appropriate agencies at both the local and the regional level, and programming in the STIP or some other commitment of funds.

"Committed" - Projects that were fully or partially programmed in the 1988 STIP, or have some other source of committed funding.

"Promising" - The next logical increment of project beyond those programmed in the STIP. Projects in this category have demonstrated their usefulness in reducing congestion or improving travel in the corridor; funding uncertainty will definitely affect programming these projects in the STIP.

"Needing Further Study" - Projects which may help relieve congestion and/or improve transportation service in the corridor, but which require further analysis or study, for one or more of a number of reasons:

- o completion of on-going work (e.g., ACR 132)
- o further estimates of demand/patronage (to determine project sizing and cost effectiveness)
- o engineering feasibility
- o further definition of project (including determination of alignment)
- o evaluataion in systems context beyond scope of STPS (e.g., determination of appropriate mix of express bus/BART/commuter rail in corridor)
- o evaluation in systems context beyond geographic boundary of STPS (e.g., Route 84 from Antioch to Fremont)
- o Potential environmental impacts

"Limited Benefit to Corridor" o Some projects initially included in the study were judged, prior to modeling, to be only marginally involved with conditions in the I-80 corridor. Although many of these projects would likely provide significant benefits to other parts of the MTC or SACOG regions, they were determined to provide only limited benefit in this corridor.

Table A-1 provides a classification for each project, by segment and type of project.

TABLE A-1
CLASSIFICATION OF COMPONENT PROJECTS

	WESTERN SEGMENT	CENTRAL SEGMENT	EASTERN SEGMENT
COMMITTED			
Highways/ HOV Lanes:	I-80 Operational Impr. Proj. I-580/Knox Freeway Upgrade I-680 widening from Willow Pass Road to Benicia-Martinez Bridge (4 to 6 lanes) North Richmond Bypass	I-80 widening from I-505 to Meridian Road Route 12 widening from Marina Blvd. to Scandia Road I-80 interchange construction at Kidwell Road I-80 interchange reconstruction at Alamo Drive and Air Base Parkway I-80 interchange modification at Redwood Street and Leisure Town Road.	Route 113 freeway bypass construction from north of Davis to I-5
Bridges:	Benicia-Martinez Bridge widening Benicia-Martinez Bridge second span	Carquinez Bridge toll plaza improvements	
PROMISING			
Transit:	Express bus service from Solano County BART/LRT from Richmond to Hercules BART/LRT from Hercules to Rodeo/Crockett	Express bus service to Bay Area Vallejo ferry service upgrade	LRT extension to Antelope Express bus service from Auburn/Roseville and Davis/Woodland to Sacramento
Highways/ HOV Lanes:	I-80 widening from Route 4 to Carquinez Bridge (HOV lanes)* I-680 widening from Willow Pass Rd. to Benicia-Martinez Bridge (6 to 8 lanes; HOV lanes) Route 84 from Fremont to Antioch: right-of-way protection for freeway/ expressway and potential rail.	I-80 widening from Carquinez Bridge to Route 37 (HOV lanes) I-80 widening from I-680 to Air Base Parkway I-80 widening from Meridian Road to Pedrick Road Route 113 widening from Dixon to I-80 I-680 widening from Benicia-Martinez Bridge to I-80 (4 to 6 lanes) I-80 interchange reconstruction at N. Texas St. and W. Texas St. & Red Top Rd. I-80 overcross widening at Suisun Valley Rd. and Green Valley Rd. I-680 interchange construction at Red Top Road. I-680 overcross widening at Gold Hill Road Route 113 from Dixon to Antioch: right-of-way protection for freeway/ expressway and potential rail.	I-80 widening from Davis to east end of Yolo Causeway (HOV lanes) I-80 widening from I-5 to Roseville (HOV lanes) I-5 widening from I-80 to Sacramento Airport (HOV lanes) I-80 interchange improvements at Business 80 (HOV lanes) I-80 interchange reconstruction at Richards and Mace Blvd. Route 113: add NB to EB and WB to SB connectors to I-5

* This study's analysis of future highway conditions clearly demonstrated a need for HOV lanes in specific locations. These are identified in this table. It is federal policy that when highways are widened the use of additional capacity by HOV's be considered. Therefore, all highway widenings in this corridor have HOV potential.

TOS/TSM:	Ban 3+ axle trucks during peak hours		

APPENDIX B

APPENDIX B

This Appendix provides the rationale for the categorization of projects presented in Table A-1. In general, projects in the "Promising" category exhibited strong potential for relieving congestion in the I-80 Corridor. Projects "Needing Further Study" either indicated less potential for reducing corridor congestion or simply were not yet well-enough defined for their potential impacts on the I-80 corridor to be assessed. Projects judged to be of "Limited Benefit" to the I-80 Corridor were largely projects perpendicular to or somewhat removed from I-80 itself; although many of these projects have significant merit in their own right, their implementation would provide only limited benefit to the I-80 Corridor. From a system management basis, however, some of the perpendicular facilities have potential to benefit the corridor by providing reliever routes for use in the event of major delays on or closure of I-80 or other corridor highways.

Following the project rationale is Table B-1, which lists the criteria used to evaluate the corridor-level alternatives. These criteria can be used to evaluate the specific projects described on the following pages.

PROMISING PROJECTS

- Express bus service from Solano County: This project would provide expanded express bus capacity from Vallejo into Alameda and Contra Costa Counties, and extend express bus service into central Solano County. These buses would utilize the HOV lanes on I-80 to achieve a significant time savings over vehicles in mixed-flow lanes.

- BART/LRT from Richmond to Hercules and Rodeo/Crockett: BART identified alternative alignments for portions of this corridor in 1981, and will soon undertake a station site location study. BART policy has recently identified Crockett as the northern terminus of this corridor. A BART extension north of Richmond, in conjunction with additional park-ride capacity in the corridor, would likely divert a significant amount of traffic from I-80.

- I-80 widening from Route 4 to Carquinez Bridge (HOV lanes): This project is the next logical increment of HOV expansion after the I-80 Operational Improvement Project, and will result in continuous HOV lanes from the Bay Bridge to the Carquinez Bridge.

- I-80 widening from Carquinez Bridge to Route 37 (HOV lanes): The construction of the new span of the Carquinez Bridge will require this widening as a necessary improvement in maintaining an adequate traffic flow north of the new bridge span. Caltrans' analysis of this project indicates that it is feasible from an engineering perspective. Right-of-way is restricted through this segment of the I-80 corridor, and this project may require the displacement of homes and businesses.

- I-680 widening from Willow Pass Road to Benicia-Martinez Bridge (HOV lanes): The programmed second span of the Bridge will necessitate additional capacity on I-680 south of the Bridge.

- Route 84 freeway/expressway from Fremont to Antioch: Although the project itself is classified as needing further study (see below), right-of-way for this project (which may include a rail line) should be preserved to protect it from development.

- Ramp metering/TOS at selected locations along I-80: These projects will promote a smooth flow of traffic along I-80, by metering access at entrance ramps and utilizing increased roadway surveillance to identify accidents, breakdowns, etc. Specific locations for ramp metering and other features of the Traffic Operations System will be forthcoming from Caltrans.

- Develop local TSM programs: By increasing opportunities for ridesharing, flextime, and other TSM strategies, local governments and employers in the I-80 corridor can help reduce single-driver commuting.

- Expand ridesharing programs: MTC, SACOG, Caltrans, and other appropriate agencies will work with RIDES, Solano Rideshare, and local cities in the corridor to ensure maximum utilization of the planned and proposed HOV lanes.

38-253 O—91——86

- Carquinez Bridge replacement of second span: Funding for this project will be provided by Regional Measure #1.

- San Pablo Avenue widening and signal coordination: This project provides increased capacity for local trips that would otherwise use I-80.

- Vallejo ferry service upgrade: This project, along with rail extensions and increased express bus services, will provide additional transit capacity in the I-80 corridor.

- I-80 Overcross Widening at Suisun Valley Road and Green Valley Road, and I-80 Interchange Revision at Red Top Road: These projects are included in Caltrans' Master Interchange Plan for the I-80, I-680, and Rt. 12 interchange relocation. As part of the overall interchange relocation project, traffic flow will be enhanced on I-80, I-680, and local arterials in proximity to this interchange.

- I-80 widening from I-680 to Air Base Parkway: This is projected to be the most congested segment of I-80 in Solano County by 2015. (Travel forecasts indicated that 12 to 16 lanes would be need on this stretch of I-80 to achieve acceptable levels of service during the peak commute hour; however, the study assumes that a cetain number of trips will be shifted to transit and arterials, and that widening to 10 lanes should be sufficient.) This project should be done in conjunction with the I-680 widening to 6 lanes (described below) and the reconstruction of the I-80/I-680 interchange.

- I-80 widening from Meridian Road to Pedrick Road: This project will widen the remaining 6-lane stretch of I-80 between Vallejo and the Yolo Causeway to 8 lanes to provide route continuity. The forecasted lane requirement for this segment is 6 to 8 lanes during the peak commute hour.

- Route 113 widening from Dixon to I-80: This project will provide improved access from Dixon to I-80 along the major route into and out of the city.

- I-680 widening from Benicia-Martinez Bridge to I-80 (4 to 6 lanes): This segment of I-680 is being studied as part of Caltrans' Benicia-Martinez Bridge Study. Expansion of I-680 will provide additional capacity that is expected to be needed upon construction of the Bridge's second span. This project shall be done in conjunction with the widening of I-80 from I-680 to Air Base Parkway (described above) and the construction of the I-80/I-680 interchange.

- I-80 interchange reconstruction at North Texas Street and West Texas Street. These projects will provide increased access between I-80 and downtown Fairfield.

- I-680 overcross widening at Gold Hill Road: This project will provide additional capacity across I-680 in the rapidly-growing Cordelia area.

- I-680 interchange construction at Red Top Road: This project will enhance access between I-680 and Cordelia/Fairfield.

- Route 113 freeway from Dixon to Antioch: Although the project itself is classified as needing further study (see below), right-of-way for this project (which may include a rail line) should be preserved to protect it from development.

- Peabody Road/Walters Road/Cordelia Road widenings: These projects, along with the programmed widening of Route 12 between Marina Boulevard and Scandia Road, would provide an arterial bypass of I-80 from Vacaville to the I-680/I-80 interchange. This bypass would provide additional capacity for local trips in central Solano County, removing many of them from I-80.

- LRT extension to Antelope: This extension directly parallels congested portions of I-80 and is currently under study by the Sacramento Regional Transit District.

- Express bus service from Auburn/Roseville and Davis/Woodland to Sacramento: This project would provide expanded express bus capacity from Roseville and from Davis/Woodland to Sacramento and extend service to Auburn. These buses would use the HOV lanes on I-80 to achieve a significant time savings over vehicles in mixed flow lanes.

- I-80 widening from Davis to east end of Yolo Causeway for HOV lanes: This segment currently operates near capacity;. As an HOV facility this widening will enhance express bus service and begin to develop demand for eventual LRT extension to Davis.

- I-80 widening from I-5 to Roseville for HOV lanes: Volumes on portions of this segment currently exceed capacity; as an HOV facility, this widening will enhance express bus services which will be oriented toward employment destinations not directly served by LRT.

- I-5 widening from I-80 to Sacramento Airport for HOV lanes: Project would ensure easy access to Metro Airport, especially for HOVs, and would enhance express bus service from Woodland.

- I-80 interchange improvements at Business 80 for HOV lanes: This project would allow HOVs, including express buses, to bypass morning peak hour bottleneck and advance to head of queue on Business 80.

- I-80 interchange reconstruction at Richards Blvd. and Mace Blvd. in Davis: Geometric and height restrictions at Richards and capacity deficiencies at Mace will be resolved.

- Route 113, add NB to EB and WB to SB connectors to I-5: These connections are missing from design of Route 113 freeway, now under construction.

- Elkhorn Road/Roseville Road/Old Auburn Road/El Camino Avenue widenings: These projects would provide additional capacity for local trips parallel to I-80 in north Sacramento County.

- Arden/Garden Connector: This project will provide more direct routing of certain local trips parallel to I-80.

PROJECTS NEEDING FURTHER STUDY

- Passenger rail upgrade between San Jose and Auburn: Specific recommendations for this rail corridor await the outcome of the ACR 132 Rail Corridor Upgrade Study, scheduled for completion in September, 1989. Initial service upgrades would likely take the form of intercity rail service, rather than commuter service.

- BART/LRT from Rodeo/Crockett to Vallejo: Implementation of this project would require further patronage estimation, including a cost/effectiveness analysis comparing the extension with express bus service. The replacement span at the Carquinez Bridge should be designed with consideration for possible future transit use.

- BART/LRT from Concord to Benicia/Fairfield: This alternative would be fairly costly. Analysis would require consideration of commuter rail along the Southern Pacific right-of-way.

- Route 84 freeway/expressway from Fremont to Antioch: This project requires further definition of alignment and traffic volumes. A systems approach should be used to address possible benefits to I-880, I-680, I-580, and I-5 in the Central Valley. This project may include construction of a rail corridor within the right-of-way.

- Carquinez Bridge restriping of eastbound span to add fourth lane (possible HOV): Implementation of this project should be considered in congunction with possible toll booth relocation/expansion and the construction of HOV lanes through Vallejo.

- Operational improvements for truck traffic at selected locations: Further definition of the specific improvements and proposed locations are needed.

- I-680 widening from Benicia-Martinez Bridge to I-80 (6 to 8 lanes, with possible HOV lanes): This project requires further estimation of HOV demand and evaluation in an HOV systems context.

- I-80 interchange revisions at American Canyon Road and Pedrick Road: These projects require further estimation of future travel demand.

- Route 113 freeway/expressway construction from Dixon to Antioch: This project requires further definition of alignment, particularly with regards to proposed river crossings. The impacts of this project should be addressed in a systems context. This project may include construction of a rail corridor within the right-of-way.

- I-80 widening between Roseville and Loomis for HOV lanes: Right-of-way is restricted through this segment; engineering feasiblity will need to be evaluated. HOV demand will be assessed in SACOG's HOV System Plan, now under development.

- I-5 widening between Route 113 and Sacramento Metro Airport: This project would be clearly needed if Route 102 is constructed only as far west as I-5; the need for the project would require further evaluation if Route 102 is to be constructed west to Route 113.

- Route 113 widening between I-80 and I-5: same concern as with project listed immediately above.

- Business 80 (Route 51) widening between E Street and I-80: Right-of-way is extremely restricted; river crossing and railroad trestle raise questions of engineering feasibility. Sacramento Transportation Authority has allocated funds for a special study.

- Baseline Road widening: This project will need to be evaluated in a systems context as part of Caltrans' Route 102 Feasibility Study.

- Truxel Road extension (HOV potential): By providing an option for South and North Natomas residents to travel to downtown Sacramento, this project will relieve I-5, allowing more capacity for I-80 (and Route 102, if built) traffic destined for downtown Sacramento. SACOG's Metro Study is evaluating the project. Potential environmental impacts of American River Parkway crossing will need to be evaluated.

- Roseville Road extension (HOV potential): This project has potential as an alternative to Business 80 widening and should be evaluated in the study funded by the Sacramento Transportation Authority. Potential environmental impacts of American River Parkway crossing will need to be evaluated.

- Elverta Road widening: This project should be evaluated in a systems context as part of Caltrans' Route 102 Feasibility Study.

- LRT extension from Antelope to Roseville: This extension goes beyond RT's 20 year plan, but is being evaluated by SACOG's Metro Study.

- LRT extension to North Natomas and Airport: This project is to be evaluated in RT's System Planning Study, now underway.

- LRT extension to West Sacramento, Davis, and Woodland: Further estimates of demand will be needed to determine cost effectiveness; feasibility of using existing I-80 causeway for this service should be assessed. Potential environmental impacts of Sacramento River crossing need to assess engineering feasibility.

- Route 102 construction from north of Auburn to near Sacramento Airport: Caltrans' Route 102 Feasibility Study will assess engineering constraints and potential environmental impacts.

- Route 102 extension west of I-5 to I-80 or Route 113: New Sacramento River Bridge and causeway raise engineering feasibility and environmental impact questions which may be addressed by Caltrans Route 102 feasibility study.

- Beltway freeway construction from I-5 to I-80 near Roseville: This project is currently being evaluated by SACOG's Metro Study.

- Beltway extension from I-5 to Route 113 near Dixon: New Sacramento River Bridge and causeway raise engineering feasibility and environmental impact questions that are not being addressed by any current studies.

PROJECTS OF LIMITED BENEFIT TO I-80 CORRIDOR

- Route 4 widening from I-80 to I-680: This project is perpendicular to the I-80 corridor. Although the project would likely benefit other portions of the MTC region, it would have only limited benefit to the I-80 corridor.

- Ban 3+ axle trucks during the peak period: The Urban Freeway Gridlock Study, recently completed by Caltrans, indicates that this strategy would be ineffective in significantly reducing peak period congestion.

- Route 37 widening from Diablo Street to Napa River Bridge: Although this project is partially funded in the STIP, it is perpendicular to the corridor, and would have only limited benefit to the I-80 corridor.

- I-505 widening from I-80 to the Vaca Valley Parkway: This project would improve local access, but would provide no improvement to the corridor.

- I-780 widening from I-680 to I-80: This project is perpendicular to the I-80 corridor; as such, it would have only limited benefit to the corridor.

- Route 12 widening from Church Street to Sacramento River Bridge (Rio Vista): This project would likely be beneficial to other portions of the MTC and SACOG regions, but is outside the I-80 corridor.

- Route 12 widening from I-80 to Route 29: This project is perpendicular to the I-80 corridor, and would only have limited beneift to the corridor.

- Route 12 widening from I-5 to Rio Vista: This project would likely be beneficial to other portions of the MTC and SACOG regions, but is outside the I-80 corridor.

- I-780 interchange modification at Glen Cove Road: This project would improve local access, but would provide no improvement to the corridor.

- I-505 overpass construction at Vaca Valley Parkway: This project would improve local access, but would provide no improvement to the corridor.

- LRT extensions along Route 102 corridor: Need for this project was determined to be beyond the time horizon of this study. This will be evaluated as part of Caltrans Route 102 feasibility study.

- I-80 widening from Route 50 to I-5: This project may not be needed if Route 102 is extended across the Yolo Bypass.

- I-5 widening from I Street to I-80: Demand on this segment would increase with construction of Route 102. Off-ramps into downtown Sacramento are already congested and no feasible solutions have been identified. The Truxel Road extension is intended to relieve I-5 and would provide a new entrance from the north into downtown.

- I-5 interchange construction at Sacramento Airport: This project would be beneficial to the SACOG region as a whole, but not to the I-80 corridor.

- Routes 50/51/99 interchange reconstruction: This project would be beneficial to the SACOG region as a whole, but not to the I-80 corridor.

TABLE B-1
Evaluation Criteria

A. Environmental

1. Impacts on Air Quality
2. Removal of Existing Developments
3. Impacts on Sensitive Areas
4. Potential for Inducing Growth
5. Compatibility with local/regional land use plans

B. Economics

1. Capital Cost ($ millions)

   a. Highway
   b. Transit
   c. TSM/HOV

2. Operating/Maintenance Costs
   ($ millions per year)

   a. Highway
   b. Transit
   c. TSM/HOV

C. Transportation Service

1. Daily Commute Trips (Study Area)

   a. Transit person trips
   b. Auto person trips
   c. Total person trips

2. Daily Vehicle Miles Traveled (Study Area)

3. Comparative Travel Times (PM Peak Hour) between selected locations in each Corridor segment

   a. Highway (via I-80)
   b. Transit

4. Level of Service (PM Peak Hour) for sections of I-80

5. Vehicle Hours of Delay (PM Peak Hour)

6. Lane-miles of Congestion (PM Peak Hour)

   a. Freeways
   b. Major Arterials

7. Regional Accessibility

   a. Service to major generator
   b. Facilitates key travel movements

8. Facilitates Urban Goods Movements

STATEMENT OF RICHARD D. WELTON
DIRECTOR OF PUBLIC WORKS & DEVELOPMENT SERVICES DEPARTMENT
FRESNO COUNTY, CALIFORNIA

AND

PRESIDENT OF COUNTY ENGINEERS ASSOCIATION OF CALIFORNIA

ON

REAUTHORIZATION OF THE POST-INTERSTATE SURFACE TRANSPORTATION PROGRAMS

BEFORE THE

SUBCOMMITTEE ON SURFACE TRANSPORTATION
OF THE HOUSE PUBLIC WORKS AND TRANSPORTATION COMMITTEE

ON BEHALF OF THE

COUNTY ENGINEERS ASSOCIATION OF CALIFORNIA

THURSDAY, JULY 5, 1990

SAN JOSE, CALIFORNIA

Mr Chairman:

My name is Richard D. Welton. I am the Director of the Fresno County Public Works & Development Services Department and President of the County Engineers Association of California (CEAC). On behalf of the Association we thank you for the opportunity to appear today before the House Surface Transportation Subcommittee to discuss the reauthorization of the Federal Surface Transportation Program.

We are here because we know the critical role transportation has in everybody's daily life. Transportation has a major role not only in the freedom of mobility, but also in the areas of economics, health, safety, and the protection of our environment. We know the Federal Government must provide visionary leadership for all levels of government--State, City, and County.

This is the most critical time for the Congress to obtain input from local and State transportation providers. Policy is being formulated and positions have not yet polarized across the country. We have always enjoyed a strong partnership among the levels of government, and we would like to strengthen even more that relationship. I am including as a part of my testimony a copy of the County Engineers Association of California Policy regarding the Federal Surface Transportation Act in the Post Interstate Era dated April, 1990. I will only summarize the major points made in this policy paper.

The fiscal requirements to simply maintain and rehabilitate California's city and County road facilities is staggering. Counties are responsible for over 70,000 miles of roads in California. A recent California Senate Transportation Committee Study documented that funding deficiencies for maintaining, rehabilitating, and reconstructing County roads alone stood at $6.9 billion.

A recent statewide gas tax measure approved by California voters will provide $1.5 billion over a ten-year period toward reducing the Counties' deficiency. This means $5.4 billion will remain unfunded and contribute to health and safety problems for our taxpayers as well as contribute to a decline of our economy. The voters in several California Counties have imposed local sales tax transportation measures and others Counties will be considering measures in the near future. Even with the revenues generated by these measures, they will still fall short of meeting the needs without the continued financial commitment of our Federal partner. In fact, these measures, as in the case in Fresno County, rely on continued Federal support to carry out a complete transportation system.

There are six major areas we offer comments on:

SUPPORT ADEQUATE LEVELS OF FUNDING

Expend the $13.5 billion trust fund, maintain current matching rates for needed construction and increase funding to meet inflation.

MAINTENANCE AND REHABILITATION

Protect the existing investment by assigning a high funding priority to the maintenance and rehabilitation of the existing National Transportation System.

EXPEDITE PROJECT DELIVERY

Establish performance standards to reduce overly restrictive design standards, certify local agencies for direct pass-through of funds, and certify State environmental review processes in lieu of the Environmental Protection Act process.

SUPPORT LOCAL BLOCK GRANT FUNDING

Maintain existing Federal participation, allocate funds based on categorical programs, and allow expenditures to be made by local decisions.

URBAN CONGESTION/RURAL ACCESS

Emphasis should be given to solutions to solve urban/suburban congestion and for access to the National system of highways in the rural areas in a cost effective manner.

SUPPORT USER FEES

Ensure that transportation uses bear the maximum practical and appropriate share of the costs of services and facilities they use (i.e., truck weight fees, fuel tax).

In conclusion, our mutual objective should be to provide a diverse transportation network which is sensitive to the environment and considers safety as a high priority. The necessary balance must be struck to provide a multi-modal system, including intercity rail, commuter bus and rail for urban areas. In addition, we believe it is imperative to protect the investment that has been made to our transportation systems.

Thank you for this opportunity. The County Supervisors Association of California (CSAC) and the County Engineers Association of California (CEAC) are looking forward to working with you and other interest groups to provide a local perspective in the development of the most effective and efficient transportation system for the Federal, State and local levels of government.

CSAC/CEAC POLICY REGARDING THE FEDERAL SURFACE TRANSPORTATION ACT IN THE POST INTERSTATE ERA
APRIL 1990

The County Supervisors Association of California (CSAC) and the County Engineers Association of California (CEAC) have developed this policy paper to address crucial issues currently being debated in the area of transportation.

As completion of the interstate highway system comes to an end, the development of a comprehensive national program for the future of our transportation system will have a profound impact on the state of California. The Road Information Program (TRIP) paints a bleak picture for California motorists in the coming decade. Considering the expected population increase TRIP projects an increase in traffic congestion of 33% on top of the 55% increase experienced between 1980 and 1988. Further, in 1989, 5,949 miles of main roads in California were operating near or at capacity during peak traffic hours – a 45% increase in the past five years. These facts provide some insight into the demand that will be placed on the current system and the investment that will be necessary.

The fiscal requirement to simply maintain and rehabilitate California's city and county road facilities is staggering. Many of these roads are in poor condition and in need of resurfacing or reconstruction. Counties maintain 70,000 miles of roads or 40% of the total mileage of California's roads. A recent study by the California Senate Transportation Committee reveals local transportation funding deficiencies for maintenance, rehabilitation and reconstruction alone at $6.9 billion. In the table attached categorical totals for each county are displayed, including, deficiencies for new construction and transportation systems management. We have concern regarding whether federal policies implemented during the post interstate era will accomodate this need.

We commend the Administration's efforts in developing the comprehensive approach outlined in *Moving America/New Directions, New Opportunities* to address transportation in the Post-Interstate era. This endeavor has generated a focus on the Nation's transportation network which is imperative if we are to meet the future needs that will be required. The Administration's first sweeping proposal seems to embrace the concept of spending down the Highway Trust Fund, however, it fails short of clearly delineating that policy and it fails to recognize the need for an increase in federal financial commitment to the highway system. Over the last 10 years the federal share of the total cost of the highway system has continued to diminish. California has recognized the need for a tremendous increase in highway funding and has before the voters a proposal which will result in doubling the California gas tax. In addition, many local agencies are supplementing state and federal funds through the use of general funds, special assessments and user fees. The voters in several counties have imposed a sales tax for transportation, and several others will be considering a measure in the near future. All of the revenues generated by these measures will fall short of meeting the needs without the continued financial commitment of the federal partner.

CSAC and CEAC feel the following outline provides the core of a proposed program of federal funding for transportation following the completion of the interstate system.

SUPPORT ADEQUATE LEVELS OF FUNDING

- Expend the $13.5 billion Trust Fund and raise the obligation ceiling to a level equal to annual trust fund receipts, including interest. This is needed to meet the Nations's mounting transportation needs. Setting the obligation ceiling at that level would bring about $15 billion to highways for the current fiscal year.
- Maintain current matching rates needed for construction.
- Increase funding to meet inflation and allow projects to proceed as planned.

MAINTENANCE AND REHABILITATION

- Focus the National Transportation Policy in the post-interstate period to recognize and protect the existing investment by assigning a high funding priority to the maintenance and rehabilitation of the existing National transportation system.

EXPEDITE PROJECT DELIVERY

- Establish performance standards to reduce overly restrictive design standards; thereby, achieving potential savings.
- Certify local agencies for direct pass-through of funds to involve only those agencies with a direct role in implementation. This is similar to the Federal government's approach with cities/counties and the Federal Community Development Block Grant Program.
- Certify state environmental review process in lieu of the National Environmental Protection Act process.

SUPPORT LOCAL BLOCK GRANT FUNDING

- Maintain existing federal participation.
  - These programs would be funded by resources no longer needed for the interstate completion projects as a substitute for the FAP, FAS, FAU, HBRR and Hazard Elimination (HE), and after a rehabilitation set aside; and by a minimum allocation program which guarantees 85% return to source at the state level.
- Allocation based on categorical programs.
  - Funds should be allocated to both state and local levels of government. Funding levels should have minimum amounts established for both state and local jurisdictions.
- Expenditures by local decisions.
  - Project funding should be based on transportation plans generated at the local level for the designated system. Project priorities should be determined at the lowest possible level and with the minimum administrative interaction.
  - Local and state government are responsible for the operation, planning and construction of highway and road facilities: therefore they must have the responsibility for project selection in planning and providing these facilities, and a role in the decision making.

URBAN CONGESTION/RURAL ACCESS

- Emphasis should be given to solutions for the urban/suburban congestion and for access to the National system of highways in the rural areas.
- The Federal government should use its capacity to generate revenue and authority to require that transportation funds be expended in the most cost effective manner.

SUPPORT USER FEES

- Ensure that transportation users bear the maximum practical and appropriate share of the costs of services and facilities they use (i.e., truck weight fees, fuel tax).

Our mutual objective should be to provide a diverse transportation network which is sensitive to the environment and considers safety as a high priority. The necessary balance must be struck to provide a multi-modal system, including intercity rail, commuter bus and rail for urban areas. In addition, we believe it is imperative to protect the investment that has been made to our transportation systems. Thank you for this opportunity. CSAC and CEAC are looking forward to working with you and other interest groups in developing the most effective and efficient transportation system for the federal, state and local levels of government.

HOUSE PUBLIC WORKS TRANSPORTATION COMMITTEE HEARING ON URBAN MASS TRANSIT REAUTHORIZATION BILL

July 5, 1990
San Jose, California

Frank J. Wilson, General Manager
Bay Area Rapid Transit District

Congressman Mineta and members of the Committee on behalf of the BART organization and our broad-based constituency here in Northern California, I thank you for giving us the opportunity to assist you in laying the foundation and framework for the transport systems that will take us into the 21st Century.

As architects of the strategies that will define the character of this Country's urban centers, you will directly and dramatically impact life as it is lived at the local level.

Public transit operating organizations are in a very real sense your contractors. We will have to execute -- build and operate -- the plans you will be setting forth in the Surface Transportation Act.

This Local/Federal partnership, which has evolved over the years, should be acknowledged, strengthened and made permanent.

This, we believe, is best accomplished by:

1. Supporting regional choice and decision-making.

2. Providing financial energy, in the proper form, to perform the function.

3. Encouraging creativity in generating solutions to mobility challenges.

4. Permitting public transit to use all of its inherent advantages to achieve National priorities of environmental preservation, economic development, elderly and disabled mobility, business opportunity for the disenfranchised and more rational energy utilization.

We believe that these critical objectives can best be achieved if the new transportation laws feature new rules and regulations that are as state-of-the art as the technologies that they finance.

We strongly urge you to ensure that the authorization legislation permits public transit to be used as a vehicle for proactive management of both Regional and National agenda and not merely a post crisis act of coping with a hopeless situation.

We need your financial and political support to be on the leading edge of service delivery and urban vitalization and not on the lagging end of stop-gap survival efforts.

The pressures are both immense and immediate here in the Bay Area. We enjoy a vibrant economy. We are experiencing sustained growth in population. One out of every ten new jobs in the Country will be created here.

BART, as a principal transit carrier, is experiencing expanding ridership and growing demands for service. If there needs to be an example of Local determination within an overall Local-Federal partnership, it must be the Bay Area. The voters of this metropolitan area have spoken clearly once again. By approving gas taxes and the sale of bonds for rail system development, we now bring billions to the bargaining table and more than our fair share to the partnership.

Funding for the four BART Extension Projects is nearly the reverse of the traditional 75% Federal, 25% Local commitment.

Our constituents have taxed themselves to build transit systems, taxed themselves to operate transit systems, and at times it appears that we invented the notion of self help. It is now time to look to our partner for help and that help can come in many forms, in addition to more money.

Two such measures would take the form of enlightened techniques in program management and administration.

1. First, the establishment of multi-year contract authority. This would provide an opportunity to fund new rail starts in a way which would permit more Federal money to be applied more rapidly and efficiently than is currently possible under full funding contract procedures, which invite earmarking, hoarding and delayed application of Federal funding.

   We have developed a proposal in this area which we would ask the committee to consider in its deliberations. We believe that it represents an example of a more forward-thinking, aggressive and creative technique that allows flexibility in program implementation.

2. The second measure calls for a more modern and sensitive Federal program that eliminates the artificial classification of transit systems into categories with hard barriers.

   The current approach differentiates between so called "old" systems such as New York, and newer systems such as BART. We oppose such fragmentation of the UMTA program. In terms of age, BART sits between the "old" systems and the new. We have significant extensions needs. At the same time if we do not embark upon a refurbishment program in the near future we will suffer the same deterioration the older systems have experienced. If there must be New Starts and Rail Modernization categories, then we believe all operators must remain eligible for funding from both sources, as their needs dictate.

These are just two examples of how progressive law-making can lead to new ways to solve old problems.

In summary, if we as transit system operators are to be successful in building the transport systems that the Congressional architects envision, then we will need solid partners not silent partners.

PRESIDENT: Herb Goldblum

VICE-PRES. CO-CHAIR
RENA MODELL

July 5, 1990

My name is [redacted], President of SENIORS CAN ACT TOGETHER (SCAT), established 1979/80to asist, support & take leadership role for advocacy of 141500 elder persons over 60 years with the AREA AGENCY ON AGING P.S.A.-10, Santa Clara County, California.

I am a member of the policy Board of Directors of the Area Agency On Aging, the Council on Aging, Inc.

2054000 Senior Citizens, reside now (1990) in PSA-10, Santa Clara County By the year 1995, 250000 (one qarter of a million) Elders will have their domicile in this County and will try to maintain their lifestyle.

20% of the Elder's population in SCC will be frail & elderly between the ages of 75-95. *** 50000 *** !!
80% of those Elders will be women.* 40000 *! 80 % of these women will be "single". 32000 !!!!.

In order to stay well (healthy),- obviously they are long survivers, (only 4% of the Aging population reside in institutional facilities), their lifestyle priority is: M O B I L I T Y.
If one takes that away or not consider mobility/transit surface transportation as a prime priority in the Reauthorization of the Transit Act, you could trigger a healthdeterioration of unknown enormity among the most vulnerable Elder's population.

This Committee under the leadership of Chair Congressman Norm Mineta, has to look with special interest (research) into the fate of this specific "group", — as this faction/group will be "THEM".

A plan of reauthorization has to contain mandated Titles of monetary protection for the weak and unprotected,* for children, handicapped of all ages & frail/elderly

SUB-COMMITTEE ON SURFACE TRANSPORTATION OF
THE HOUSE PUBLIC WORKS AND TRANSPORTATION COMMITTEE

TESTIMONY OF GOLDEN GATE BRIDGE, HIGHWAY
AND TRANSPORTATION DISTRICT

July 5, 1990

Good morning. My name is Robert B. Stockwell. I am President of the Golden Gate Bridge, Highway and Transportation District, the regional mass transportation provider for the Golden Gate Corridor and also am a member of the Marin County Board of Supervisors and the Metropolitan Transportation Commission. I am delighted to appear before you today. Also with me this morning are the following prominent regional and local officials:

1. Gary Giacomini, member of the Marin County Board of Supervisors and Bridge District Board; and

2. Jim Harberson, member of the Sonoma County Board of Supervisors and the Bridge District Board.

We are here today to vigorously urge the Congress to adopt legislation reauthorizing the Federal highway and mass transit programs and to appropriate funds at levels well above the modest funding amounts that characterized these programs during the 1980's. Providing mobility for all people, elimination of congestion and gridlock, and improvement of the quality of the air we breathe are among the greatest domestic challenges we face today. Our urban environment, marked by dirty air and by daily traffic jams, is significantly adversely affecting the quality of life for our citizens. For several years, the people of the San Francisco Bay Area have indicated that traffic congestion constitutes the single greatest problem of this region. The people here desire significantly expanded mass

transportation services throughout the region and a markedly improved highway system. The conviction of the people of the Bay Area to solve urban congestion is demonstrated by the repeated willingness of the voters of this area in recent years to approve ballot initiatives that have increased taxes to support mass transportation and highway programs. In the South Bay, on the Peninsula, in the East Bay and in San Francisco, sales tax measures have been adopted in support of specific transportation programs formulated by local officials. It is anticipated that the North Bay counties of Marin and Sonoma will soon follow suit.

On a Statewide basis, the voters of California just last month

reversed the anti-tax crusade of the late 1970's and the 1980's by approving a nine cent increase in the gasoline tax and the issuance of major bond measures in support of mass transportation and highway projects throughout the State. But state and local governments cannot solve our critical urban problems alone. A renewed partnership between the federal government and state and local governments is absolutely critical to solve the nation's transportation problems both in the 90's and as we prepare to enter the 21st Century.

For a few moments, we would like to describe the unique transportation corridor that is served by the Golden Gate Bridge District and of the recent significant steps that have been

taken by the counties of the region and the District to both preserve and expand that corridor. In the late 1960s, automobile congestion was reaching an all time high and the continued future existence of mass transportation providers in the region was seriously in doubt. The post-World War II aubomobile boom was at its apex and few people in the region were riders of mass transportation. Indeed, by that time, the few remaining private transportation companies in the area had launched steps to be relieved of future service obligations.

As a consequence, the Golden Gate Bridge District was directed by the California Legislature to plan and operate a mass transportation system, in concert with the counties of the

region, utilizing surplus bridge tolls as the means for the provision of capital and necessary operating subsidies for the system. In partnership with the Urban Mass Transportation Administration, the District quickly inaugurated a multi-modal transportation system consisting of buses and ferries. In addition, the District became an innovator in the concept of ridesharing, sponsoring van pool and car pool programs for residents of the region. The District's philosophy was simple: provide people with high quality services and give them choices as alternatives to continued single occupant use of their automobiles.

Initial results of the District's efforts were outstanding.

Automobile traffic across the Golden Gate Bridge initially diminished. More significantly, throughout the 1970's, which were marked by significant increases in population in the North Bay region served by the District, automobile traffic on the Golden Gate Bridge remained essentially at 1969 levels. Indeed, by the late 1970's, approximately 50 percent of the commuters between the North Bay and San Francisco were utilizing either buses, ferries, or ridesharing programs provided by the District. Even now, as the District initiates its third decade of regional service, automobile congestion on the Golden Gate Bridge, although severe at times, remains relatively close to the levels that existed during peak hours some 20 years ago.

There is, however, much more that needs to be done to relieve the nightmare that faces many thousands of commuters each day. New and improved transportations systems must be implemented that will significantly lessen the amount of automobile travel in the Golden Gate corridor.

Noteworthy in this respect is the fact that in recent years the most serious congestion problems in the Golden Gate corridor actually have arisen within suburban Marin and Sonoma counties. As housing costs have forced home buyers and renters to move farther and farther away from San Francisco, and as businesses have relocated or new businesses have been established in the suburban communities, suburban congestion has become the

watchword and problem of the day. New transportation programs therefore must be created to accommodate the large number of Golden Gate corridor residents whose home to work patterns are radically different than those that existed 20 years ago.

The center piece of our efforts in recent years to address the acute problem of suburban congestion has been the acquisition of the railroad right of way that runs parallel to US 101 in Marin and Sonoma Counties. An Interagency Task Force, led by Supervisor Bob Roumiguiere of Marin County, was created to pull together the necessary resources and to obtain necessary local concensus to obtain and protect this precious resource. Consisting of representatives of Marin and Sonoma Counties, the

cities of these counties and the Bridge District, the Northwestern Pacific Right of Way Task Force negotiating team undertook appraisal studies, environmental audits, title searches and other due diligence steps over the course of the past seven years. As a result, the Task Force concluded a series of major right of way transactions that will assure a permanent transportation corridor for the region. A short summary of these transactions follows:

1. January 24, 1983 Purchase and Option Agreement. By this initial agreement, the Bridge District, the County of Marin and the Marin County Transist District acquired a two year option to purchase the railroad right of way located between

Tamalpais Drive in Corta Madera and Bellam Boulevard in San Rafael. This step prevented the right of way from being sold off for non-transportation purposes. At the same time, by this transaction, for the sum of $10,000 paid with local funds, the public agencies actually acquired all of the railroad's non-fee interest in the right of way covered by the option.

2. Acquisition of Tamalpais Drive-Bellam Boulevard Right of Way. On December 28, 1984, the fee ownership portion of the right of way covered by the above-mentioned Option Agreement was acquired by the Bridge District. This 1.5 mile segment was purchased for the total sum of $1,100,000. No federal funds were involved in this acquisition. The source of funds was

$700,000 from the State of California and $400,000 from the Bridge District.

3. Acquisition of Barnes Property Station Site. On February 5, 1983, the Bridge District purchased an important projected station site (known as the Barnes site) immediately adjacent to the right of way previously purchased and situated in close proximity to the Bridge District's Larkspur Ferry Terminal. This 1.52 acre parcel was purchased for the sum of $1,285,000. The funding source was 100 percent Bridge District funds.

4. Our most significant right of way transaction to date

was closed just last Friday. An additional 11.25 miles of right of way (approximately 101.84 acres) together with all improvements located between Bellam Boulevard in San Rafael and the center line of Novato Creek in the vicinity of Rowland Boulevard in the City of Novato, was acquired for the sum of $10.1 million. Thanks to the efforts of Congressman Doug Bosco, Congresswoman Barbara Boxer, Chairman Andersen and your own efforts, Mr. Mineta, and those of other key members of the California delegation, this acquisition was made possible largely by virtue of the Federal Demonstration project funded pursuant to H.R. 2 enacted in 1987. This legislation provided $24 million to acquire the right of way situated between San Rafael and the City of Healdsburg. The acquisition

that closed last week fully implements the first phase of the federal program.

5. Conditional Sales Agreements -- Acquisition of Rights of Way from Novato to Willets. As part of the just closed San Rafael to Novato acquisition, conditional sales agreements have been entered into covering two additional critically important segments of the right of way. The first is an approximately 41 mile right of way located between Novato and the City of Healdsburg, including station sites. The second consists of approximately 74.5 miles of right of way generally located from the City of Healdsburg in the County of Sonoma extending north to the City of Willets in the County of Mendocino supplemented

by an approximate 24.23 mile right of way located between the City of Novato in Marin County extending northeast to the railroad point known as Lombard in the County of Napa, including station sites. The parties have agreed upon a total purchase price of $27 million for this additional approximately 140 mile right of way acquisition. Closing is subject to several conditions which will have to be satisfied in a three year period for the Novato to Healdsburg acquisition and a four year period for the Healdsburg to Willets purchase. Among these conditions is the obtaining of necessary funds to close the transaction.

The purchase of the remaining portion of the right of way is vital to the interests of the Golden Gate Corridor. Mr. Chairman and members of the Committee, we are before you today with an appeal to assist us in our efforts to complete the land acquisition program necessary for mass transportation and highway service in the Golden Gate Corridor and ultimately to assist in efforts to implement a transportation system on the right of way. We come before you on a united basis, all of the counties in the region and the Bridge District having joined together to plan for our transportation needs in the 21st Century. And it is the unanimous conviction of the governments of this region that the remaining rights of way must be preserved and protected at the earliest possible date.

We face major transportation problems but have identified solutions based upon regional concensus. We now need the help of the Federal Goverment through the reauthorization and appropriation processes for the highway and transit programs to convert our aspirations and needs into reality. Our specific financial requirements to conclude the right of way purchase and associated due diligence studies is estimated to be $18.5 million. I and my colleagues stand ready to provide additional information and assistance in any way that it may be desired and are at this time prepared to respond to any questions that you or members of the Committee may present. We are most appreciative of this opportunity to address our needs.

REAUTHORIZATION OF THE POST-INTERSTATE SURFACE TRANSPORTATION PROGRAMS

MONDAY, SEPTEMBER 17, 1990

HOUSE OF REPRESENTATIVES,
SUBCOMMITTEE ON SURFACE TRANSPORTATION,
COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION,
Altoona, PA.

The Subcommittee met, pursuant to call, at 8:00 a.m., at the Ramada Inn, Altoona, Pennsylvania, Hon. Norman Mineta (Chairman of the Subcommittee) presiding.

Present: Representatives Mineta, Shuster, Anderson, Hammerschmidt, Roe, Clinger, Murtha, McEwen, Packard, Lightfoot, Hastert and Hancock.

Mr. MINETA. The Subcommittee on Surface Transportation of the House Committee on Public Works and Transportation will please come to order.

In the interest of time and to maximize the amount of time afforded all our very distinguished witnesses, I will submit my prepared statement for the record and urge my Committee colleagues to do the same.

I do, however, want to take the time to say that it is very fitting for this Subcommittee on Surface Transportation to have this field hearing here in Altoona, in view of the many contributions made by your Representative in the U.S. Congress, Congressman Bud Shuster. Bud is the ranking Republican on the Subcommittee on Surface Transportation and is essentially, really—his efforts have been essential to the legislative work of the House Committee on Public Works and Transportation. I know how proud you must be of Bud and his accomplishments in the House since his first election in 1972. But from my perspective as a Committee colleague, I can personally vouch for how tirelessly Bud works to improve the well-being of the Ninth Congressional District.

Since I became Chair of the Surface Transportation Subcommittee in February of 1989, Bud has been a great teacher and an inspiration to me, continuously demonstrating his expertise and Pennsylvania know-how on every facet of our Committee's jurisdiction, and especially of course as it relates to surface transportation issues, not only for the Ninth Congressional District, but for our great country.

Bud Shuster was instrumental in the development of the 1987 Surface Transportation Act and rest assured he will continue I know to play a leading role in the development of the new surface

transportation legislation that will affect Pennsylvania and our nation.

Let me thank in advance today's witnesses for their testimony. I apologize that we are going to have to shrink the time that is available for the witnesses. It has become apparent that we are going to have votes on the floor of the House of Representatives today, so rather than spending half a day here in Altoona, as we had originally anticipated, we have had to shrink that time period down to just about an hour and a half to two hours here before we go on to Ebensburg. But I do again want to thank the witnesses for their being here, for their testimony. We will be in touch with you if we have any inquiries or questions to ask of you and ask you to submit your response for the record in writing. And again, I want to pay special thanks to Congressman Bud Shuster for inviting us to the fine city of Altoona and to Pennsylvania's Ninth Congressional District.

[Mr. Mineta's prepared statement follows:]

REGIONAL FIELD HEARING
POST-1991 FEDERAL-AID PROGRAMS FOR HIGHWAYS AND MASS TRANSIT SYSTEMS

OPENING REMARKS BY

NORMAN Y. MINETA, M.C.

CHAIR

SUBCOMMITTEE ON SURFACE TRANSPORTATION

PUBLIC WORKS AND TRANSPORTATION COMMITTEE

U.S. HOUSE OF REPRESENTATIVES

RAMADA INN

ALTOONA, PENNSYLVANIA

SEPTEMBER 17, 1990

8:00 A.M.

Today, the Subcommittee on Surface Transportation continues its field hearings to help determine the sum and substance of the future Federal-aid highway, mass transit, and highway safety programs once the current programs expire on September 30, 1991.

During the past 34 years, Americans have enjoyed a tremendous Federal investment of more than $270 billion in our nation's transportation systems.

We have built more than roads and bridges, Interstates and mass transit systems.

We have built a way of life that has sustained the American people and fortified our economy.

But what of tommorrow -- especially in states like Pennsylvania where transportation plays such a key role?

For tommorrow, we must make certain that Americans can travel safely. We must move people and goods in a way that will improve our economic competitiveness, the quality of our air, and our overall quality of life. And we must leave no doubt in the minds of our children that we will act consistently, and with foresight.

Americans now travel more than 2 trillion miles on our highways each year. In the future, that level will only rise. And yet it is estimated that as a nation we will need to invest more than $95 billion annually just to maintain the current level of service through the year 2020.

The question is: Where will we get the money, and how should we use it?

Clearly, the strong partnership that already exists among the American people, business, industry and all levels of government will be called upon to meet the challenges of building and rebuilding our transportation systems.

But, at the same time, we must never lose sight of the fact that how we spend that money is as important as how much money we spend.

More than a year ago, the Subcommittee on Surface Transportation set a legislative agenda to build the transportation future America wants and needs.

We have conducted hearings in Washington, D.C. We have received expert testimony. But the health and well-being of our transportation network requires more hands-on input than any series of Washington hearings could provide.

This is why we are here today in Pennsylvania.

It is also fitting that we hold a field hearing in Altoona in view of the major role played by your Representative and the Surface Transportation Subcommittee's Ranking Minority Member Bud Shuster.

I know how proud you must be of Bud. As a Committee colleague, I can personally vouch for how tirelessly Bud works to improve the well-being of the 9th Congressional District.

Since I became Chair of the Surface Transportation Subcommittee in February 1989, Bud Shuster has been a great teacher and inspiration for me, continuously demonstrating his expertise and Pennsylvania know-how on every part of the Committee's jurisdiction -- including highways, transit, safety and various regulatory matters.

Bud Shuster was instrumental in the development of the 1987 Surface Transportation Act. And rest assured, he'll play a leading role in the development of new surface transportation legislation that will affect Pennsylvania.

There is much that we need to do in this legislation.

In the 1960s and 1970s, we spent more than 2.3 percent of our annual Gross National Product on our transportation network. In the 1980s, that level shrunk to four-tenths of one percent.

The result has been congestion on our highways, deficient or functionally obsolete bridges, substandard pavement, and decay of our mass transit systems.

And the lesson is clear:

Transportation programs must never again be underfunded as they have been in the recent past.

In the 1990's, I believe the key to finding solutions to our nation's transportation problems will be to define the appropriate Federal role.

I believe that Federal role must take into account state and local needs, program flexibility, and the right of people who have paid taxes into the transportation trust funds to get what they've paid for -- and not see those funds idle away at the same time there's talk of increasing the Federal gas tax.

Through this hearing, I am confident that we will further our efforts to determine what the Federal role should be in the future, and to identify how we get there from where we are today.

Let me thank today's witnesses in advance for their testimony, and offer special thanks to Representative Shuster for inviting the Subcommittee to visit the fine city of Altoona and Pennsylvania's 9th Congressional District.

Mr. MINETA. At this time, let me yield to our host member of Congress, Bud Shuster.

Mr. SHUSTER. Thank you very much, Congressman Mineta, and I want to thank you for being here today, all the way from California, along with all of my colleagues; Congressman Anderson, the Chairman of the full Committee also from California; Congressman Roe, a member of the Committee and Chairman of the Science, Space, and Technology Committee; a good friend and neighbor, Jack Murtha, one of the real leaders of the United States Congress, it is a privilege to be holding hearings jointly with Congressman Murtha; Congressman Hastert, also one of our colleagues on the Committee; and Congressman Hancock of Missouri; Bill Clinger, our neighbor from the north and Congressman McEwen from Ohio; Congressman Packard from California; Congressman Lightfoot from Iowa. All of these distinguished colleagues—somebody said we have more members at this hearing today than we can get in a hearing in Washington. So we are just thrilled to have you all here and thank you so very much.

Mr. MINETA. At this time, I would like to recognize the Chairman of our full Committee on Public Works and Transportation, the very distinguished member from California, Chairman Glenn Anderson.

Mr. ANDERSON. Thank you, Mr. Chairman. It is a pleasure to join you and our distinguished colleague, host and friend, Congressman Bud Shuster, at this important hearing today.

Altoona has historically been a crossroads of commerce within the State of Pennsylvania and virtually all of the recent transportation improvements which support this commerce can be traced to one man, that is Congressman Bud Shuster. In fact, Bud may be the only Congressman who has both a highway and a byway named after him. I cannot think of another Member who is so deserving of this honor. Congressman Shuster works tirelessly on behalf of his constituents and his State in a way which sets a standard of public service that humbles many of the rest of us by comparison. His leadership and in-depth knowledge of transportation issues have proven invaluable to me, both when I was Chairman of the Surface Transportation Subcommittee, of which he was and is the ranking Republican, as well as after I became the Chairman of the full Committee on Public Works and Transportation. Time and again, Congressman Shuster has provided a needed push to highway and transit legislation in order to get a bill enacted into law, and he is a nationally acknowledged expert on surface transportation issues.

The Committee will rely on Bud's proven abilities even more when we begin to draft the next highway and transit reauthorization bill.

Thank you very much, Bud and thank you, Norman.

Mr. MINETA. At this time, I would like to recognize the ranking Republican on the full Committee on Public Works and Transportation, a person I have had the privilege of working with as the ranking Republican when I was chairing the Aviation Subcommittee. Just recently we were in his Congressional District in northwest Arkansas, and I would like to now call on Congressman John Paul Hammerschmidt.

Mr. HAMMERSCHMIDT. Thank you very much, Mr. Chairman.

You know, it has been a great pleasure and honor for me to serve with Bud for close to two decades in the House and on this Public Works Committee. And as we all on this Committee know, no one has more expertise on the issue of surface transportation or done more for the nation's highway program than Bud Shuster. He has been the ranking member on the Subcommittee for the past 15 years and in that time Bud Shuster has made enormous contributions to the nation's highway program. During his nearly 18 years in Congress, Bud Shuster has been a major force in the highway legislation developed by our Committee and enacted into law. He was instrumental in the 1978, 1982 and 1987 Highway Acts, and he will once again, along with Norman Mineta, be taking the lead in development of the next highway legislation in the post-interstate period. Of course that bill will be before the Congress next year.

So again, Mr. Chairman, Altoona is the place to be this morning for highway legislation and I am very pleased to be with you. Thank you.

Mr. MINETA. The congressman from California, Glenn Anderson, is the Chairman of the full Committee on Public Works and Transportation, but the next in seniority is a very distinguished gentleman from New Jersey, who also chairs a full Committee in his own right, and that is the Committee on Science, Space and Technology, a person who has worked very hard on the subjects that are within the jurisdiction of our Committee, Congressman Bob Roe of New Jersey.

Mr. ROE. Thank you, Norman, I appreciate your introduction and all the other members and colleagues who are here. I, too, want to join with our group and mention—in fact, it is amazing if I may share this point with the audience here, and our guests, as pointed out by Bud, if you get 10 or 12 or eight or five or six members at a Committee hearing in Washington, it is a lot. And if you look along here, you have 12 representatives from throughout the entire nation.

Now I think that Bud and I have been very, very good friends, along with Jack Murtha over the years. New Jersey and Pennsylvania have a great deal in common and I just enjoy working with Bud a great deal as one of our great leaders. I would like to add a codicil, Mr. Chairman, if I may to Mr. Anderson, our full ranking Chairman. As we look at the new highway transportation program, I do not know how it is going to affect you here in Pennsylvania, but one thing we in New Jersey are looking into is the cost of energy and cost of operating on highways and what is going to happen as far as gasoline and energy supplies particularly. So I hope that as we develop, with the input of the people from Pennsylvania and under the leadership of Norman Mineta and Bud Shuster, that we develop really a comprehensive program in transportation that is going to be really the milestones of the future of the country.

So I thank you for inviting me. I am honored to be able to join you in Pennsylvania and the great city of Altoona and I am sure that our results today will be very beneficial to the country.

Thank you, Mr. Chairman.

Mr. MINETA. I would like to next introduce the gentleman from Pennsylvania who is to the north of Bud Shuster's district, a person who serves as the highest ranking Republican on the Aviation Subcommittee for our House Committee on Public Works and Transportation, the very distinguished gentleman from Pennsylvania, Bill Clinger. Bill.

Mr. CLINGER. Thank you very much, Mr. Chairman, and I am very pleased and honored to be part of this hearing today and to join with all of you here in Bud Shuster's district. Bud has been my mentor ever since I came to the Congress and I have learned a great deal from him on how to carry out my responsibilities as representative. My goal is to have as good highways in the 23rd Congressional District as Bud has achieved here in the Ninth Congressional District, and we are working on that.

But I think Pennsylvania can be very, very proud that Bud Shuster is going to be an instrumental voice in the fashioning of highway policy in this country for the next 10 to 20 years. Next year is going to be a very critical year in shaping highway policy. It is really the first opportunity we have had in more than 25 years to take a whole, fresh new look at the direction of highway policy. And knowing of Bud's long experience and dedication to the development of a superior transportation system in this country, I think we in Pennsylvania can be extraordinarily proud of the contribution he is going to make. So I am delighted to be here with all of my colleagues this morning.

Mr. MINETA. As many of you know, Congress has a two-track system. We have an authorizing process and then once the legislation authorizing something to get done passes, then you have what is known as the appropriations track to appropriate the money for what has been authorized into law. That combination is I suppose part of the thing that makes Congress a deliberative body. But in any event, our Public Works and Transportation Committee is an authorizing committee.

We have a very, very important member of the Appropriations Committee here with us today, who has the district to the west of Congressman Bud Shuster, and that is Congressman John Murtha, and it is really great to have someone of his caliber with us because frankly we on the Public Works and Transportation Committee have gone to Bud—I mean to Jack, on many occasions to have him help us get the monies that are necessary really to be appropriated by that Committee for the things we authorize into law.

So Jack, it is great to have you with us and I am pleased to introduce you at this time.

Mr. MURTHA. Mr. Chairman, let me just thank all of you for coming, and what everybody has said is a phenomenal tribute, I think, to Bud Shuster, the fact that we have so many members who were willing to take the time from their own busy schedules to come out here to Altoona and to Ebensburg. And I am pleased to host with Bud—Bud is really the premier surface transportation expert in the country and it is a pleasure to be here with him and to see such a turnout from the full Committee. Of course you have 11 of the most distinguished members of Congress from all over the country and I am just delighted and very appreciative of all you

folks coming to Western Pennsylvania. We tried to have the perfect weather and a few leaves turning and so forth.

Mr. MINETA. At this time, I would like to introduce Congressman Bob McEwen of Ohio. Bob.

Mr. MCEWEN. Thank you, Mr. Chairman, and as Henry VIII said to his fifth wife, "I will not be keeping you long."

And as you are moving along here, I just very simply want to add also that I am delighted to be here with Bud. Bud Shuster brings this Committee to his district because he wants all of us from around the country to know what is next on his agenda for the Ninth Congressional District. And people like me come because we want to see how it is done right. Bud Shuster is the kind of Congressman the people in my district wish they had representing them in Washington, and as a result, I am delighted to watch a man who does everything well. What he does, he does precisely and expertly and I just like to move in his wake. But as the last two speakers have just spoken, Pennsylvania does have an especially talented Congressional delegation.

Bud and I have served on the Intelligence Committee together and whenever we are speaking about what is of vital interest to America and when we need to do what is right, the name Jack Murtha constantly comes into the mix because we rely upon him tremendously and I will say more about that at our next hearing. But I also serve on a delegation that is working with the future of Europe with Congressman Bill Clinger, also from Pennsylvania, and there is no one who is more multi-faceted and brings more to the Congress than Bill Clinger does as well, and so it is a delight to be with you and to be in the District of perhaps the finest Congressman in America, Bud Shuster.

Thank you.

Mr. MINETA. Congressman Packard, Ron Packard, of California.

Mr. PACKARD. Thank you. I will be very brief.

One of the most significant public works projects in the history of the globe will be culminating next year just about this time, and that is the interstate system of this country. You can imagine what this country would be like in terms of its economy and moving of goods and people if we did not have the interstate system that now exists. That started 35 years ago and Bud Shuster has played a very important role in the development of that program.

We now are entering into the phase of a replacement program for the next 30 years of this country in developing a transportation system and a maintenance system of the interstate system. There is no question that Mr. Shuster and some of us will be very prominently involved in developing that new plan.

I am looking forward to hearing the witnesses that will outline what Pennsylvania's concerns and interests are in the development of that kind of a plan and certainly this will be a prototype meeting that will apply to the entire country.

It is a pleasure to be with you.

[The prepared statement of Mr. Packard follows:]

STATEMENT OF
THE HONORABLE RONALD C. PACKARD
REPRESENTING THE 43RD DISTRICT OF CALIFORNIA
BEFORE THE SUBCOMMITTEE
ON SURFACE TRANSPORTATION
SERIES OF HEARINGS ON THE
REAUTHORIZATION OF THE
POST-INTERSTATE HIGHWAY PROGRAM
ALTOONA, PENNSYLVANIA
SEPTEMBER 17, 1990

MR. CHAIRMAN:

I JOIN YOU AND CHAIRMAN ANDERSON AND OUR OTHER COLLEAGUES IN STATEMENTS OF HIGH AND MUCH DESERVED PRAISE OF OUR HOST BUD SHUSTER. BUD SHUSTER IS ONE OF THE MOST EFFECTIVE MEMBERS OF CONGRESS. JUST TAKE ONE LOOK AROUND ALTOONA AND YOU REALIZE VERY QUICKLY THE HIGH QUALITY LEVEL OF SERVICE THAT BUD PROVIDES FOR THE NINTH DISTRICT OF PENNSYLVANIA.

THAT, HOWEVER, IS NOT THE SOLE MEASURE OF HIS EFFECTIVENESS AS A CONGRESSMAN. AS THE RANKING MEMBER OF THE SURFACE TRANSPORTATION SUBCOMMITTEE, BUD SHUSTER IS QUITE POSSIBLY THE AUTHORITY ON THE INTRICACIES OF THE HIGHWAY PROGRAM. IN ADDITION, BUD SHUSTER HAS ALWAYS OFFERED HIS TIME AND ASSISTANCE IN SECURING MUCH NEEDED HIGHWAY DOLLARS AND PROJECTS FOR MY DISTRICT. AS I AM SURE HE HAS FOR MANY OTHER MEMBERS HERE TODAY.

AS THE SUBCOMMITTEE TRAVELS AROUND THE NATION ADDRESSING THE NEEDS OF THE NEXT HIGHWAY REAUTHORIZATION, EACH MEMBER OF THE SUBCOMMITTEE, MYSELF INCLUDED, IS KEENLY AWARE THAT OUR NATIONAL TRANSPORTATION SYSTEM IS VITAL TO OUR ECONOMY AND TO OUR INTERNATIONAL COMPETITIVENESS. AS OUR HIGHWAY SYSTEM HAS BECOME OLDER IT HAS BECOME GRIPPED WITH CONGESTION IN MANY AREAS. AS OUR ABILITY TO TRANSPORT GOODS, SERVICES AND PEOPLE FROM ONE PLACE TO ANOTHER BECOMES HAMPERED, OUR ECONOMY SUFFERS.

WITHOUT AN ADEQUATE TRANSPORTATION NETWORK, THIS NATION WILL FALL FARTHER BEHIND IN THE GLOBAL MARKETPLACE. THE ABILITY OF THE UNITED STATES TO EFFECTIVELY COMPETE WITH JAPAN, GERMANY, AND THE REST OF THE WORLD RESTS WITH THE ABILITY TO FORMULATE A HIGHWAY BILL THAT WILL ADEQUATELY ADDRESS OUR TRANSPORTATION NEEDS TODAY AND IN THE FUTURE. WE MUST FORMULATE A PIECE OF LEGISLATION THAT WILL TAKE OUR TRANSPORTATION SYSTEM INTO THE TWENTY-FIRST CENTURY AND BEYOND. I AM CONVINCED THAT WITH THE LEADERSHIP OF CHAIRMAN MINETA AND THE RANKING REPUBLICAN BUD SHUSTER WE WILL ACHIEVE THIS GOAL.

I COMMEND CHAIRMAN MINETA FOR SCHEDULING THESE MOST VITAL HEARINGS AND I LOOK FORWARD TO HEARING THE TESTIMONY OF TODAY'S WITNESSES. I ALSO LOOK FORWARD TO WORKING WITH CHAIRMAN MINETA AND CONGRESSMAN SHUSTER IN FORMULATING THE HIGHWAY BILL.

Mr. MINETA. Congressman Jim Lightfoot of Iowa.

Mr. LIGHTFOOT. Thank you, Mr. Chairman. I too would like to join my colleagues in complimenting Bud Shuster.

When I first got to Congress and was put on the Surface Transportation Subcommittee, of which Bud is the ranking member, I asked Bud what some good advice you would have for a young man from the midwest, and he said, "Well I will give you some words to live by, just remember that breakfast is the most important meal of the day. If you are not home by then, you are in real trouble." [Laughter.]

So we have followed his advice and been able to continue in this position and the marriage has stayed together and everything has worked rather well, thanks to Bud.

But you folks in Pennsylvania are very fortunate to be represented by people like Bud and Jack and Bill. I have a chance to work with Bill, I am on the Aviation Subcommittee with Mr. Clinger, and Jack, we meet in the halls once in awhile, I am not on any of his committees, but as has been said before, he has been very instrumental in helping all of us in various and sundry ways as we move along. So you have got, I think, a group of outstanding members that—they are smart, they are intelligent, they are gentlemen and besides that they all three have a good sense of humor and that is kind of what makes this world go round.

It is a pleasure to be here this morning.

Mr. MINETA. Thanks a million, Jim. Congressman Dennis Hastert of Illinois.

Mr. HASTERT. Thank you, Mr. Chairman. It is certainly also a pleasure to be here. I guess I have to be pretty straight with you folks, this is an important hearing to Bud Shuster and that is why we are here, because Bud Shuster is important in the U.S. Congress. It is a pleasure to work with Mr. Clinger and Mr. Murtha and other distinguished members from Pennsylvania.

I do not know if Bud is reincarnate or not, but the first national road program in this country started here in Pennsylvania and certainly this state is a keystone state and I guess we are here to see how it is done.

So it is certainly a pleasure to be here, and thank you, Mr. Chairman.

Mr. MINETA. At this time, I would like to introduce a first term member of the Congress from Missouri, who is doing a very, very fine job, Congressman Mel Hancock.

Mr. HANCOCK. Thank you very much, Mr. Chairman. At least he did not say the oldest member of the freshman class, that is the way I am normally introduced.

It is a real pleasure to be here. I would like to take this opportunity to express my appreciation to the people of this area for their courtesy and hospitality and the way they welcomed us. You are welcoming a great district and the people from the State of Pennsylvania, the Congressmen from the State of Pennsylvania.

Thank you very much for inviting me.

We are fortunate because in this country and before this Committee, we are literally at the crossroads. We are trying to decide, given the signing of the law back in 1955 by President Eisenhower of the interstate highway and defense system, that we now by the end of 1991 will have completed that system with some 43,000 miles of highways at an investment of some $127 billion.

Now in order to renew this legislation and bring it into law, it not only takes of course the action of the Congress, but also the signing of that law by the President. And we are fortunate in this country to have Secretary of Transportation Sam Skinner. Sam has put together a very, very good team at the Department of Transportation. In fact, one of them is your own from Pennsylvania, a person by the name of Dr. Tom Larson, who was the Secretary of Transportation here in Pennsylvania under Governor Thornburgh at the time. And he has also brought to the Department of Transportation another Pennsylvanian by the name of Brian Climber, from Philadelphia, who was associated with SEPTA, the Southeast Pennsylvania Transportation Agency.

And so we have a very good team at the Department of Transportation and we are fortunate to be able to have also across the country very fine people who serve in transportation positions. And today we are graced to have with us your Secretary of Transportation from the Commonwealth of Pennsylvania—we are pleased to have you with us, Mr. Secretary.

So at this time, I would like to recognize the Secretary of the Pennsylvania Department of Transportation, Howard Yerusalim, who is accompanied by Larry King, who is the assistant to the Deputy Secretary for Planning for Penn DOT. At this time, Mr. Secretary, go ahead. Your full statement will be made a part of the record, and if you would go ahead and proceed in your own fashion.

TESTIMONY OF HOWARD YERUSALIM, SECRETARY, PENNSYLVANIA DEPARTMENT OF TRANSPORTATION

Mr. YERUSALIM. Thank you, Mr. Chairman and Chairman Anderson and distinguished members of this Committee. It is a pleasure to be here this morning, and I think the number of you here today certainly is a tribute to our Congressman Bud Shuster. He certainly is a leader in surface transportation and in many other areas of importance to this country.

On behalf of Governor Casey, I would like to welcome you to Pennsylvania.

As you mentioned, Chairman Mineta, you do have a copy of my testimony and I will not read that testimony, it is quite voluminous and I will stick to my 15 minutes or less.

As Secretary of Transportation and Chairman of the Pennsylvania Turnpike Commission, I am going just to discuss the highlights of that testimony. The Casey administration is proud of our relationship with our Congressional delegation, especially Congressman Clinger, Shuster, Borski, Kolter of this Committee and certainly Congressman Jack Murtha who will be involved in this hearing and the hearing this afternoon in his home territory in Ebensburg. You truly have made a difference in Pennsylvania. Governor Casey and I both thank you for that difference that you have made.

Under the Case administration leadership, we have placed $4.2 billion worth of highways and bridges under construction during the last four years. This is a 50 percent increase over the size of our program in the previous four years. This program has included 1,200 bridges that are replaced or major rehabilitation has taken place during that four year period under our billion dollar bridge program, which I will mention briefly later. It also has included 3,000 other projects on our 41,000 mile highway system and the 25,000 bridges that are on the state system alone. That does not include all the local roads in Pennsylvania.

That program resulted in three state years of one billion dollars being paid to the contractors who have performed that work in Pennsylvania. It resulted in 12,700 direct construction-related jobs and I am not talking about all the spin-off jobs that come about as a result of that large construction program. And it resulted in the virtual completion of the interstate system in Pennsylvania.

Last year, 1989, we opened more miles of interstate highway than we have in any year in the last two decades. We opened Interstate Route 78, which is south of Allentown, Bethlehem and Easton for 32 miles in Pennsylvania with five new miles in New Jersey, which is making eastern Pennsylvania a bedroom community to northern New Jersey and New York. We also opened I-279 in the Pittsburgh area which goes from downtown Pittsburgh to the North Hills section. Those two projects that were opened last year cost approximately one billion dollars.

We have two other interstate routes which are presently fully under construction and will be completed next year. In downtown Philadelphia, the Vine Street expressway, a two-mile part of our beltway in Philadelphia that cost well over $200 million for that two miles of highway—times have changed.

We also have under construction a project known as the Blue Route. The Blue Route was first drawn on a map 60 years ago, not 25 or 35 years ago. We finally have it totally under construction. We appreciate your support and we will complete that project next year. That interstate program cost close to two billion dollars for those four projects alone.

We have also made progress like this only through the strong federal-state-local partnership that we developed. And of course, special thanks go to Congressman Shuster, someone I have worked with very closely these last four years and being what I consider to be Tom Larson's right-hand person for at least four of his eight years. We have been working much longer with Congressman Shuster.

Congressman Shuster provided funding for 35 miles of what some call traffic route 220, but we all know it is the Bud Shuster highway. And that is to provide that expressway facility so vital to the economy of this area from the turnpike interchange at Bedford to Altoona. Congressman Shuster did not stop there. In the last Transportation Act, he included $72 million to continue that expansion of traffic route 220 to the Tyrone bypass, another 12 miles, the $72 million in special funds which we will be matching. This is the first time that those types of projects required a 20 percent match. We have had some cost increases and I have made a statement that I am not going to go back to Congressman Shuster and

say please provide the funding for those cost increases. We are going to provide them through Pennsylvania's funding because we appreciate what the Congressman has done.

But he did not stop there. In the House Transportation appropriation bill that was proposed for federal fiscal year 1991, he proposed two million dollars to study traffic route 220 north of the Tyrone bypass. Eventually we want traffic route 220, the Bud Shuster Highway, to be a gateway to Canada and we are on our way.

Also in the Surface Transportation Assistance Act of 1987, funds were provided for a bus testing and research facility which has been in operation for one year now, and that is a $3.2 million project.

I also want to give special thanks to Congressman Murtha. I have worked very closely with the Congressman over these last four years. He provided $22.5 million in special funds for the Ebensburg bypass, and I know you will be in Ebensburg this afternoon. I am only sorry that you do not have the time to visit that facility which will be open to traffic by the end of next month.

Also, Congressman Murtha has proposed $20 million in the federal fiscal year 1991 Transportation Appropriations Act for traffic route 56 in Cambria, Somerset and Westmoreland Counties, and you will see that all our roads in Pennsylvania certainly do not look like traffic route 220. We have got to make that one of our goals, so that they all can look that way.

Federal funding over the last four years is what has made this all possible. Two billion dollars in formula funds that we have received in Pennsylvania over the last four years, $800 million in discretionary and other special funds went toward that program. And in the transit area over four years we have received $685 million in federal funds. We are very grateful for this, but our needs are great, and the money is there in the trust funds so that we could do even more. And I am calling upon you today, and I know that you support this statement, to release the $25 billion that is laying dormant in various trust funds, $18 billion in the highway trust fund, $11 billion of which is for highways and seven billion dollars of which is for transit. These funds should be released before we talk about dedicated funding in Pennsylvania for transportation above what we already have.

The U.S. DOT has told us at an AASHTO meeting that was held a couple of months ago that the annual highway program, if the trust fund balances were released, could be increased from $13 billion a year to between $18 and $20 billion a year and that the transit program could be increased from $3.1 billion a year to $4.5 billion per year. We hope that this occurs.

Let me turn to transit briefly because I think transit is very important to our urban and suburban areas. We have 20 urban transit systems in Pennsylvania, including two of the largest systems in the nation; in Philadelphia, which was referenced by Chairman Mineta, SEPTA; and our system in Pittsburgh known as PAT. Federal aid for these systems has been dwindling. For example, from 1979–1980 to fiscal year 1990–1991, the state operating assistance for these systems has nearly tripled from $119 million to $331 million. At the same time, federal assistance has decreased from $86.2 million to $11.4 million that is proposed by the administration for fed-

eral fiscal year 1991. That is an 87 percent decrease in federal assistance at a time when the state has tripled their commitment to the operating assistance for transit. SEPTA is a special situation itself in the Philadelphia area. It has great operating assistance needs, but it also has great capital needs. This year, the state is providing $319 million to SEPTA alone, $223 million of which is for operating assistance. The administration has proposed that SEPTA not receive one dollar in operating assistance for federal fiscal year 1991. I know that recommendations like that have not been passed by Congress and I am sure—and I have every wish—that you will not accede to that recommendation made by the administration in this year.

Next I will turn to the post-interstate challenge. What should the reauthorization contain? Because that is what we are really here about today. First of all, we must complete the interstate system and most of it is complete. But in Pennsylvania we took advantage of a provision known as advance construction interstate, and we have used $275 million of our own money—I think it is very important that those contracts we signed with the federal highway administration be honored and that that $275 million be returned to Pennsylvania. We took out short-term notes in order to fund that.

I also understand that it is going to cost seven billion dollars to complete the interstate system throughout the nation and I think that should be part of the reauthorization legislation.

I support the system that is being proposed by U.S. DOT of a system of national significance. But that system must be rational. I think Congressman Shuster made that clear by some statements that he made with respect to that system. As a result, we have been asked, through AASHTO, from the Federal Highway Administration to develop that system. I think the system that they have asked us to develop is neither rational or reasonable. What they have told us is develop a system based on those roads that carry 35 percent of the vehicle miles of travel or 40 percent of the vehicle miles of travel in the entire state. Let me tell you that in Pennsylvania, that system at 40 percent would comprise 4,885 of highway out of a 41,000 mile state highway system and over 110,000 miles of highway in Pennsylvania, when you include local roads.

There must be flexibility in the use of the funds in the reauthorization. I have heard statements like 70 percent of the funding should go to the system of national significance. You can see that that would not serve us very well in Pennsylvania if only 5,000 out of 110,000 miles of highway were eligible for 70 percent of the funding that becomes available. I do not think that proposal is flexible and I do not believe that it is rational.

These states must be allowed to transfer funds among the categories. The system of national significance and the so-called flexible category.

Emphasis should be on national issues including highway system completion, highway system preservation. I think safety must be a keynote in the reauthorization. I think bridges must be a keynote and possibly most important in our urban and suburban areas, congestion relief must be right at the top. There should be flexibility in the use of federal funds, a continuation of dedicated user fund-

ing, full use of the trust funds, equitable distribution among the states and reduced federal oversight.

The U.S. DOT has begun their efforts toward the future. Among Pennsylvania's comments and concerns with respect to what I have heard so far that U.S. DOT is doing are, first, mass transit needs to be more fully utilized to support multi-modal transportation systems. We have to tie together the highways with the transit systems. I concur with fully funding the interstate system. Pennsylvania has a special interstate situation that is probably not shared by other states, but it does impact New Jersey, Congressman Roe, and I thought I would mention that.

The Surface Transportation Assistance Act of 1982 mandated that we build an interchange between I-95 in southeastern Pennsylvania and the Pennsylvania turnpike so that I-95 will switch over to the Pennsylvania turnpike and the New Jersey turnpike. I think it is very important that since Congress mandated that interchange, which will cost $500 million, that Congress fund 90 percent of the cost of building that interchange, both the part that is required for the interchange in Pennsylvania and the extension into New Jersey. And I have recently spoken to Tom Downs, my compatriot from New Jersey, and he feels very strongly about that also. I believe it should be 90 percent funded, as I have mentioned before.

I recommend flexible funding, including more toll financing. First by flexible, I mean the use of funds to meet individual states' needs. Pennsylvania, as you may recall, was one of seven original pilot states that were allowed to use federal funds together with state funds and toll revenues in order to build a toll facility, that being the Mon/Fayette Expressway in western Pennsylvania. Next month, we are going to open the first section of that Mon-Fayette Expressway, a $55 million project that will be a toll facility. It is being funded with state funds. We really did not use federal funds on that section, although we could have. But I think that that program has proven that it can work and I think that it should be expanded. I think toll revenues are one other way to help provide the funds that are needed in the future so that we do not have to increase taxes further.

We are also building half a billion dollars' worth of toll road expansions utilizing funds available from our own turnpike system; one being the Beaver Valley Expressway in western Pennsylvania and the other the Greensburg Bypass, known as the Amos K. Hutchinson Bypass, in western Pennsylvania. The only reason we are able to build $500,000 worth of toll facilities, however, is because our existing turnpike is a money-maker. And that is what is funding these other routes. In fact, in Pennsylvania as is true probably in many states, toll financing alone cannot support itself for new highways. When you get into an urban area, the projects are so expensive that even though the traffic is high and the revenues are high, the cost to build the facility and maintain it cannot support its cost. On the other hand, in the rural areas, it costs a little less to build the facilities but the revenues, since the traffic is less, don't begin to support the toll facilities. And that's why I think there should be a mixture of federal, state and toll revenues in order to support future toll facilities.

38-253 O—91——88

I oppose increasing motor fuel taxes for deficit reduction. We should also address the tax issues regarding gasohol and other alternate fuels which will be used more in the future in order to clean up our air. While spending down the trust fund balances, we should not arbitrarily reduce the federal share of project costs. I have heard things like 60 percent federal where it is now 80 or 90 percent or even 40 percent federal, and I do not believe that is the way to go.

I also believe in equitable funding to all states based on their needs. For example, truck traffic and bridge needs are not part of the formula for distributing interstate restoration funds. Pennsylvania is considered a five percent state. In most of the federal aid categories, we receive five percent of the formula funds. For interstate restoration, we only receive 2.5 percent, again because the truck traffic which causes a lot of the damage on the interstate system is not considered in the formula, and neither are the bridge needs. So I think we need to change that.

I believe the trucking industry should pay its fair share for the damage they cause to our roads. I also oppose mandating that all states are forced to allow twin 48's and triple trailers. I know in some states that might work real well, but in Pennsylvania with our rolling terrain and our geology, that will not work and it will not be safe.

Finally, there should be less federal oversight. We have proven this in two programs that we have initiated in Pennsylvania. The one was initiated under Tom Larson, I believe that I was kind of the father of that program with Tom's leadership. That is known as our Billion Dollar Bridge Program. We have a dedicated source of funding just for that billion dollar bridge program, and since 1983, we have built 1,300 bridges for $1.4 billion and that program will continue at a $200 million per year level over the next few years.

We also have a special safety program. I think safety is very important. It is known as the Carter Safety Initiative. We have identified 55 high-accident corridors in Pennsylvania and set aside $50 million in highway funds to make low-cost improvements along those corridors. But that is not the whole key to that program because that program includes increased police enforcement, a large media campaign, increased emergency medical services. And that program has impressed both AASHTO and the Federal Highway Administration to the extent that we have won two awards from the American Association of State Highway and Transportation Officials for that program and a few months ago Tom Larson came to Pennsylvania to present Governor Casey and I with the 1989 safety award for innovation for the entire country. And Tom has asked that we travel around the country spreading that program so that it can be utilized in many of the other states.

In closing, we must deal with urban and suburban congestion in the reauthorization. Highways and bridges continue to be very important and I am not lessening their importance in any way, they will continue to be very important. However, highways and bridges alone will not solve the congestion problems in our urban areas and our suburban areas that we see happening in Pennsylvania and they have already happened in some other states. The single

passenger automobile is causing congestion in areas where there is not adequate right-of-way to build more facilities. It is consuming too much fuel and we are still dependent upon the Middle East for oil and it is increasing air pollution.

We can solve the problems in many ways. One is integrating transportation modes; highway, transit, rail, aviation. They all must be integrated. We must build more park and ride lots so that we can get people into car pools and van pools. We must build more high occupancy vehicle lanes so that we can get three and four people in our automobiles. We must make better utilization of those car and van pools. We must provide incentives for the use of transit. An interesting thing, recently we had to close a garage in Harrisburg. We provide parking for many of our employees. If I were to provide a transit pass for our employees, it would cost me about $300 for a full year and those employees would have to pay federal income tax on that benefit. But yet, I am spending close to $1,000 for each parking space in a parking garage and that is not taxable income. I think there is something wrong when we look at things in that manner.

We have to implement intelligent vehicle highway systems. We have to implement more ramp metering than we have in the past and we have to continue building transportation centers that tie the different modes of transportation together, and there are many, many other ways that we can improve the movement of people and goods rather than just the movement of vehicles, in the future.

And last, states should be rewarded for innovative programs that they have. Right now we are working on a model 21st century demonstration project for Interstate 95 in Pennsylvania. We have shared that with Tom Larson and Brian Climber, the two gentlemen that we mentioned before, the Federal Highway Administrator and the UMTA Administrator, and they are both very interested in that program. I think states should be rewarded for innovation like that.

In closing, let me just say thank you for inviting me to testify today and thank you, Bud Shuster, for being Bud Shuster.

Thank you very much.

[The prepared statement of Mr. Yerusalim appears on p. 2910.]

Mr. MINETA. Thank you very much, Mr. Secretary, for a very complete, thorough statement, and as indicated, this will be made a part of the record.

I would like to ask, first of all, the Commonwealth of Pennsylvania has received over the last ten years over a billion dollars in special funding for highway demonstration projects. These amounts were made available in addition to other federal aid apportioned highway funds. You have made a number of recommendations in your file statement, and I was wondering if you could recommend to the Committee any changes to the federal aid highway program that would provide a sufficient level of funds to address the transportation needs within the Commonwealth, without the aggressiveness of the Pennsylvania delegation in pursuing some of these extra funds that you have been able to receive.

Mr. YERUSALIM. There was a song "I love New York". I love my Congressional delegation—let me start by saying that.

I think——

Mr. MINETA. When I say Congressional delegation, I really mean Bud Shuster. [Laughter.]

Mr. SHUSTER. A billion dollars here, a billion dollars there——

Mr. MINETA. You are talking real money.

Mr. SHUSTER [continuing]. You are talking real money, yeah.

Mr. YERUSALIM. Well if people will not talk about me, I will say I love Bud Shuster also.

But the real answer I think is releasing these funds that have already been paid in the trust funds. If we could go from $13 billion to $20 billion or maybe even a little bit more, and the states matched those increased funds, the program could really double. So that would help very much.

But we certainly do appreciate what Bud Shuster has done for us, and he has done it because it is the right thing to do. It has improved the economy of the Commonwealth, it has been for key corridors, it has not been for projects that are not vitally needed.

Mr. MINETA. One of the things you talked about in terms of truck safety, in the present law, there are three states that are grandfathered in terms of weight limitations; Hawaii, Michigan and New Mexico. In the Transportation Appropriations Bill right now there is a provision that that exclusion also be extended to the State of Wyoming to increase and go beyond the 80,000 pound truck weight. Do you think that there ought to be this state-by-state approach in terms of what we do on truck weights given what your statement had indicated?

Mr. YERUSALIM. Well I am not in favor of increasing truck weight. I think it will have an impact on safety, I think it will have an impact on the needs to maintain our highway systems and it will have an even greater impact on our bridge systems and that is why I made that statement.

Mr. MINETA. Mr. Shuster.

Mr. SHUSTER. Thank you, Mr. Chairman.

Mr. Secretary, I certainly do appreciate your fine testimony and your very kind words. I just have one question. It has been pointed out to us that in the past highway bill, we spent over $800 million in railroad crossings and it has been suggested that that expense, because those crossings are there for the convenience of the railroad, should not be paid for out of the highway trust fund by highway users, but rather by the railroad corporations. I wonder if you would comment on that.

Mr. YERUSALIM. Yes, Congressman Shuster. First of all, I believe the rail/highway crossing situation is definitely a major safety initiative that we must continue. I too agree with your statement that the railroad should be paying more of the share. In Pennsylvania where it is a state highway crossing a railroad, it is 90 percent federal funding and ten percent state funding. Also, we are at the mercy of the railroads as far as completing those projects. They do the work themselves and a project that should be done this year gets done this year or the year after sometimes, and that is not a good situation.

But I do agree with you that the railroads should be paying more for that program.

Mr. SHUSTER. Thank you very much.

Mr. MINETA. Chairman Anderson.

Mr. ANDERSON. Mr. Secretary, the Pennsylvania Highway Association acknowledged the importance and value of a modern safe highway system that is adequately financed through dedicated funding sources to stimulate economic growth. Now, in addition to the increased use of toll revenues as you mentioned to finance highway projects, what other creative financing method could or should be considered to improve our highway system?

Mr. YERUSALIM. Well one that we have been using in Pennsylvania has been a greatly increased role of the private sector. We have insisted, where there is new development, that the developers play a large share in the improvements that are required by that development. So that is one method. But I think that if the trust fund balances can be released, I think that will get us along the way to meeting those total needs. We will never meet the total needs for every highway that someone out there in Pennsylvania thinks is needed. But I would stand on our record. A program of $4.2 billion over the last four years is a significant program. There are other needs, some of them are real needs, some of them are perceived needs. But if we can get the trust fund extended, I am sure that Pennsylvania will match all of those funds and our program could virtually be doubled just by doing that.

Mr. ANDERSON. Thank you.

Mr. MINETA. Congressman Hammerschmidt.

Mr. HAMMERSCHMIDT. Thank you, Mr. Chairman, and thank you, Secretary Yerusalim, for your fine statement.

I do not have a question but I think I do want to make a comment about trust funds. You know in these days of budget deficits and the budget summit, I am sure there is some concern in the general public that when they see figures like Bud Shuster getting $72 million for the State of Pennsylvania, they wonder where that money is coming from. I just think that it needs to be clarified for the benefit of the general public and maybe the media that those were dedicated revenues, which do not affect the deficit one way or another. Those were funds that were set aside for that specific use and I just think that we ought to clarify the fact that all this money that Bud gets comes out of dedicated revenues paid for by the users. It is very important the public know that.

Mr. YERUSALIM. Thank you very much, Mr. Hammerschmidt, I am sorry that I did not make that clear in my testimony.

Mr. HAMMERSCHMIDT. Thank you.

Mr. MINETA. Mr. Roe.

Mr. ROE. Mr. Chairman, I would like to ask two questions. One is you made a very declaratory statement—I want to congratulate you, by the way, on your testimony, particularly the part where you talk about the inter-relationship between Pennsylvania and New Jersey.

But the issue you made, which I think is going to be a hot one coming up very rapidly now, the triple trailer issue, is on the weights and as Chairman Mineta pointed out, the states that do allocate or allow that particular type of operation now. Do you see any—other than individual states making their decisions as you are making your decision for the State of Pennsylvania and we for New Jersey—do you see that if there should be consideration given

to much higher truck fees, if they are going to use triple trailers? Because I think one of the points—if the gentleman will yield—I think one of the points we are making is not only the safety concern, we would be terribly concerned in the State of New Jersey on the safety aspect of it, but I am thinking about the point of view of the wear and tear on the highways and bridges if they do allow heavy weight triple trailers, should they not pay or should they pay higher fees?

Mr. YERUSALIM. Well Congressman Roe, I do believe they should pay higher fees. I think they should be paying higher fees today. I do not believe trucks are paying their fair share—trucking companies are paying their fair share for the damage that they cause to our highways and to our bridges. But I think in a state like Pennsylvania, safety has to be the major concern. I just do not think those type of trucking systems will work. And I could cite examples. Some of it is perceived in our citizens' minds. When they see a twin trailer coming through their community, it just scares them to death, and they put a lot of pressure on me to find a way to not allow those existing allowed 28-foot twin trailers to go through their streets. But I am concerned about the damage done by increased weights and I think that if that does occur in a state, that the trucking firms should be paying more of the fees.

Mr. ROE. If the gentleman will yield further—do you see that truck traffic as part of the formula that is to be related to any involvement where truck traffic becomes part of the formula for distribution?

Mr. YERUSALIM. I think that it should because I think trucks are what cause the damage. At one time, AASHTO had a chart, it was kind of dramatic, it showed one truck and 9,600 automobiles as far as the damage that is caused to vehicles. They do not use that chart any more and I am not sure that it was exactly accurate, but I am concerned about the damage done by trucks and that trucking companies should be paying for the damage that they cause to the roads.

Mr. ROE. One more question, Mr. Chairman, if I may. It is kind of a blockbuster, but I have got to ask it. The Congress of course, as the nation, is terribly concerned about the energy issue that we are faced with and where this whole situation in the Middle East is going to go as it relates to imports of oil and energy costs. Having said that, going back about five or six—no, more than that, it is close to ten years—when we had a similar problem, we passed legislation that mandated a 55 mile per hour speed limit. According to the reports as a result of the analysis of the history of that particular experience, there was considerable safety improvement involved and also, as I understand the issue, there was considerable reduction in the hundreds and hundreds of millions of barrels of oil that were reduced because of the speed limit.

What do you see in that, do you see that to be practicable, recognizing the enormous increase now in gasoline costs and so forth and so on?

Mr. YERUSALIM. I believe strongly in the 55. We are one of ten states that still has a 55 mile per hour speed limit on our rural interstates. I think it is a safety concern first. A recent report by NITSA has indicated that in states where the speed limit was in-

creased to 65, that the accidents on rural interstates have increased by 31 percent. I think that was the fatalities. So we are very concerned about that. But we also think at a time when we do not know the future of our oil situation, with what is going on in the Middle East, this is not the time to be increasing speeds. And a lot of people argue, they say people are already traveling 65, why do you not change your speed limit to 65. Well I have my own feelings on that, and I have a feeling that people, especially with cruise control, set their cruise control a certain limit above the actual speed limit. And if we in Pennsylvania were to go from 55 to 65—and this has been an issue on our Pennsylvania turnpike with legislation proposed—I think those that are traveling at 62-63 miles an hour today would probably be driving at 72-73 miles per hour after the law was changed. And that concerns me greatly, from a safety standpoint and from a fuel use requirements.

Mr. ROE. Thank you, Mr. Chairman.

Mr. MINETA. Let me remind the members that we have a very strict time schedule to try to adhere to today, so I would appreciate the cooperation of the members. Mr. Clinger.

Mr. CLINGER. Thank you, Mr. Chairman. I have no questions. I want to commend Secretary Yerusalim on your statement and also your leadership of the Transportation Department of Pennsylvania—you are doing an excellent job. And I also want to commend you for the emphasis you placed in your statement on the need to address our transportation problems as a unity. In other words, there needs to be a comprehensive approach, including highways, aviation, rail and so forth, and mass transit. I think that that challenge to our Committee, as we begin to fashion a surface transportation bill, should be taken very much to heart. We need to look at this as an integrated system. I think that is what the national transportation policy which Tom Larson was an architect of, emphasizes too, the need to really look at this thing as a need to include all facets of transportation and a unity.

Let me just ask one question, and that is, there has been a lot of discussion about how privatization might be brought into play in terms of developing our highways. Do you see that privatization has any role to play?

Mr. YERUSALIM. It has a large role to play and it is playing it today. Last evening we had dinner with Mark Pascarella. I have dealt very closely with Mark and every time Crown American has a new plan for Pennsylvania, a new mall or an expansion, they come to us, and they are willing to pay the transportation costs to improve the transportation system to provide the access to their facility. We have facilities all around the state. We were also with the Tomias family last night and the Tomiases, when they have a new mall, they have been willing to share costs with us. So I think the private sector does have a role to play and I think it is going to be larger in the future than it has been in the past. That $4.2 billion that I talked about did not include all of the improvements that we are having made by the private sector, so our program is even larger than what I said it was.

Mr. CLINGER. Thank you.

Mr. MINETA. Mr. Murtha.

Mr. MURTHA. No questions.

Mr. MINETA. Any other questions from members of the panel?

Mr. ANDERSON. I have one.

Mr. MINETA. Mr. Chairman.

Mr. ANDERSON. I asked one, but Mr. Roe asked three, so I figure I can ask a second one.

Mr. Secretary, since the Pennsylvania Department of Transportation's 1984 through 1996 12-year bridge and highway program provides for improvements for U.S. 22 corridor, why is there still a need for a federal emphasis on addressing the U.S. 22 corridor improvements?

Mr. YERUSALIM. Well our 12-year program—and since then we have had a 1996—or 1986 to 1998 program and a 1988 to the year 2000 program—the 1988 to the year 2000 program, for the first time, over a 12-year period, addressed making Route 22 from the Johnstown area where you will be close to this afternoon, to Pittsburgh a four or five lane facility. Due to the revenues available, that has been spread out over the 12-year period of the program. Some of the projects will start next year and some will start in years after that.

I think the strong partnership that we have developed in all of our transportation improvements around the state should continue with respect to traffic route 22. I think it is a key gateway to the Pittsburgh market. We have a new airport that is being built in Pittsburgh. We put up in state funds, not asking for one dollar of federal funds, although we received some defense funds, $190 million highway to provide access to that new airport. But I think if we are going to fund traffic route 22 and move it up and do it in a shorter time period than our present program, any increase in federal funding that is available would help. And the statement that I made about releasing the trust fund certainly would play a major role in expediting the traffic route 22 project.

Mr. ANDERSON. Thank you.

Mr. MINETA. Thank you very much, Mr. Secretary and Mr. King for your very fine presentation.

At this point I would like to call forward Commissioner Bill Stouffer of Blair County. Local government is such an important part of what gets done and I know that many members of the panel have come from local government—I served as a mayor of a community. So Commissioner Stouffer, we appreciate very much your work here in Blair County.

Your full statement will be made a part of the record, so if you would just abbreviate your remarks and proceed on your own, sir.

TESTIMONY OF WILLIAM STOUFFER, COMMISSIONER, BLAIR COUNTY, PA

Mr. STOUFFER. You can rest assured I will, Mr. Chairman.

Gentlemen, I do—Congressman Shuster, we appreciate your position here today. I appreciate, respect and admire your Committee's approach to the federal highway system. I appreciate especially Congressman Shuster's active participation on this Committee.

I am completing my 27th year in public office and do not ever remember any Congressional Committee that has made more of a favorable impact on our area than you have.

Altoona was the last city in the United States with a population of more than 50,000 people to be connected to a limited access highway. And that incidentally is the Bud Shuster Highway. With the completion of that highway, it is estimated several thousand new jobs will be added to the economy. I am presently serving as chairman for the nine southwestern counties in Pennsylvania as their transportation chairman under the American Industrial Heritage Committee, of which Congressman Murtha is very, very familiar with.

Our number one priority in construction is the construction or reconstruction of traffic route 22 from Pittsburgh to Harrisburg. It was designated as a trailway, the William Penn Trailway, in 1804. And I am sure you all know that economic development and tourism follows good highways.

We on the American Industrial Heritage Committee are interested in seeing scenic highways which create a more favorable impact on tourism.

Finally gentlemen, we urge you to keep doing what you are doing with the federal highway system. Keep it separate and from the general fund budget. Our Congressman has told us several times, on several occasions, that you intend to do that.

Several years ago when you voted to override President Reagan's veto, you did not lose a vote from this area, including our two United States Senators.

I never felt I would see the day when terrorism would affect tourism, but it is. And I think we need to do what we are doing now, build new highways, rebuild the infrastructure, give the Americans a chance to see America first, keep them at home.

I have submitted my testimony and I would be welcome to any questions.

[The prepared statement of Mr. Stouffer appears on p. 2896.]

Mr. MINETA. Very fine, Mr. Stouffer, thank you very much. Your statement will be made a part of the record.

You have included in your testimony support for establishing a new categorical grant program in relation to a national scenic byways program. I was wondering if you might be able to explain to the Committee the significance of a federal role for establishing this kind of a new category for scenic byways.

Mr. STOUFFER. The Industrial Heritage Committee is a combination of nine counties, Mr. Chairman, and it is our hope to highlight the origination of the steel, coal and railroad industry in this particular area. And we feel that we are offering a program on tourism to encourage people to come to our area, to see the origination of those industries in our area. And I think there is nothing that would be more appealing than to have good highways and scenic highways when they come into the area. I think that with federal highway participation and the construction, it is our intention to build—like 22 follows basically the same corridor that the trailway was built in 1804, and the old canal. And we would hope that with federal monies—we on the local level are certainly not capable of doing that and we are talking about the construction, the improvement of 22 and improving the scenic view while you are doing it.

Mr. MINETA. Thank you very much. Mr. Shuster.

Mr. SHUSTER. No questions. Thank you very much, Bill.

Mr. MINETA. Mr. Roe.

Mr. ROE. No questions.

Mr. MINETA. Mr. Hammerschmidt.

Mr. HAMMERSCHMIDT. No questions. We appreciate your testimony very much.

Mr. MINETA. Mr. Clinger.

Mr. CLINGER. No questions. Thank you.

Mr. MINETA. Mr. Murtha.

Mr. MURTHA. No questions.

Mr. MINETA. Any other panel members with questions for Commissioner Stouffer?

[No response.]

Mr. MINETA. If not, Commissioner, thank you very, very much for your presence here today and for your work on the preservation commission as well.

Mr. STOUFFER. Thank you, sir. Keep up the good work.

Mr. MINETA. Appreciate it. I know Mr. Shuster will keep us on our toes.

At this time, I would like to call forward a panel made up of Mr. Robert Hetherington, Managing Director, Pennsylvania Highway Information Association; Mr. Bob Donaldson, Executive Director, Centre County Planning Office; Mr. Robert Bini, Executive Director, Centre Regional Planning Commission; Mr. Robert C. Finley, Chairman of the Transportation Committee for the State College Area Chamber of Commerce; and Mr. Kenneth H. Quigley, Executive Director, Appalachian Thruway Association. So if the panel will please come forward, we will start off with Mr. Hetherington.

Without a doubt, Pennsylvania, I guess since about 1938, 1939, has really been a leader in this whole issue of major highway programs and so the Pennsylvania Highway Information Association really is well known in the industry for what it does, and we are pleased to have you with us, Mr. Hetherington. If you would go ahead and proceed in your own fashion, you statement will be made a part of the record, sir.

TESTIMONY OF ROBERT E. HETHERINGTON, MANAGING DIRECTOR, PENNSYLVANIA HIGHWAY INFORMATION ASSOCIATION; ROBERT B. DONALDSON, EXECUTIVE DIRECTOR, CENTRE COUNTY PLANNING COMMISSION; ROBERT BINI, EXECUTIVE DIRECTOR, CENTRE REGIONAL PLANNING COMMISSION; ROBERT C. FINLEY, CHAIRMAN, TRANSPORTATION COMMITTEE, STATE COLLEGE AREA CHAMBER OF COMMERCE; AND KENNETH H. QUIGLEY, EXECUTIVE DIRECTOR, APPALACHIAN THRUWAY ASSOCIATION

Mr. HETHERINGTON. Thank you, Mr. Chairman, I appreciate the opportunity very much, and thank you, Congressman Shuster, for giving us the opportunity to be here, and Congressman Clinger and Congressman Murtha from our great State of Pennsylvania, and the other members of the panel.

I did appreciate Chairman Anderson reading into the record the mission statement of the Pennsylvania Highway Information Association, I will not repeat that, it is in the record. However, our main mission in life is to demonstrate the importance of roads to

the economy. And Route 220, as folks drove north from the Washington area coming up here today, will emphasize the important point here. This road, before it was built, was a winding, two-lane highway, that had a lot of accidents on it. This road has cut those accidents down in half. This road has stimulated the economy. And the reason I bring Route 220 into the picture simply is that is the value of the importance of the highway system of the future in the extension of the next interstate act, if you will. Our organization likes to refer to it, the extension of the act, as creating economic-generating type roads. They stimulate the economy, as Route 220 has done, and added so many thousands of jobs and so many businesses have been added up along this route since the road was opened last year, 52 businesses and 3,500 jobs. A 37 percent increase in retail sales, for instance, off the Altoona interchange alone. The fatality rate on the highway has been dropped to half.

In Bedford County alone, another 1,000 jobs were created. The full economic potential though of this route will not be measured until the route is extended beyond Tyrone, connecting up to Interstate 80 to make it a total network.

The trust fund, as Secretary Yerusalim pointed out, is a key point here in the continued development of the road system for the United States. And highway users are the only ones, as you members of the Committee know—the only ones who pay into this road system—highway users, not the general public. It does not add to the deficit as was pointed out by one of the members of the panel.

Senator Byrd already has had a study made by the General Accounting Office that shows that the trust fund can operate with a minimum balance of three billion dollars and not affect the situation. Today, that trust fund balance is over ten billion dollars.

One of the points that I would like to make, following up the statement that was made by Secretary Yerusalim on "we must find innovative ways of doing things", we must be rewarding states for doing something special. This is the 50th anniversary year of the Pennsylvania turnpike. The Pennsylvania turnpike has made a tremendous contribution to the society, to travel, to commerce, to economic development. More than 270,000 vehicles use this road every single day. And the turnpike—when the interstate act was started in 1956, a jump start was made simply by putting 2,800 miles of turnpikes onto the system. We now have over—we will have over 42,000 miles of interstates with 2,800 miles of the turnpike.

So the Highway Information Association thinks that maybe we ought to take a look at giving those states that had the far-sightedness to develop a toll system because the states could not build the roads at the time, they did not have the financing—give these states some sort of economic bonus in the next highway act, provide these states with some sort of an incentive to continue that kind of a program.

In summary, what I would like to point out to you is some of the points on the federal side, obviously.

Protect the integrity of the Highway Trust Fund from non-highway users.

Pass legislation to take the trust fund off the unified budget.

Increase the trust fund to the full level to help the states meet the growing and costly highway and bridge needs of the states, ac-

cording to the United States Department of Transportation's need study.

Reduce the $10 billion highway trust fund surplus to a minimum operating level of three billion dollars as recommended by the General Accounting Office.

And I would be remiss if I did not point out deep appreciation of not only the people of this area, but the people of Pennsylvania for the tremendous contributions that have been made to the state by Congressman Shuster, Congressman Clinger, Congressman Murtha and the other members of the Pennsylvania delegation who serve and serve so well.

And thank you to this Committee for giving us the opportunity to make testimony today. Thank you.

Mr. MINETA. Thank you very much, Mr. Hetherington. Mr. Donaldson.

[The prepared statement of Mr. Hetherington appears on p. 2834.]

Mr. DONALDSON. Thank you, Mr. Chairman and distinguished members of the Public Works and Transportation Committee.

On behalf of the Centre County Planning Commission, we would like to thank you for this opportunity to present some of our thoughts and recommendations concerning this matter.

By way of introduction, I think it is important to understand that access to and from Centre County has historically been provided by Routes 322 and 220. This primary means of access has more recently been supplemented by Interstate 80, a major east-west corridor through Pennsylvania. With the completion of the interstate system, Centre County has experienced significant increases in both intrastate and interstate truck traffic movements.

The map to my right or left, as you are looking at it, is an illustrative map simply showing our centralized location in the state. And I am going to dwell upon those three routes that are considered as missing links.

With the dynamics of Center County's accelerated growth, and particularly in the State College and Penn State University area, which we call the Centre Region part of Centre County, and with the ever-increasing number of trucks passing through Centre County, we call at this time upon the federal government and the Commonwealth of Pennsylvania to provide adequate levels of funding which will allow for the completion of the various highway links which have not yet been constructed through Centre County.

If we look at Penn DOT's primary commercial highway network, which includes the interstate system, the Appalachian Thruway, as well as other major arterial highways, we see that the network is not yet complete.

A close observation suggests that various missing links exist across Pennsylvania and we are here today to encourage you to recognize these gaps in our highway system and to do what you can to assure that adequate levels of federal funding will be available in the future to allow the Pennsylvania Department of Transportation to proceed with the completion of the state highway network which will allow for the construction of these missing links.

The Centre County missing links are the feeder routes and connectors between our local communities and employment centers and the interstate system of highways, and include the following:

The Route 144 missing link between Interstate 80 and Route 322 at Potters Mills. This has a current estimated construction cost of about $23.5 million.

The second missing link is the Route 26 missing link between Interstate 80 and Route 322 at the Mount Nittany Expressway near State College and Penn State, estimated cost about $75 million.

And thirdly, the Route 220 missing link between the village of Bald Eagle in Blair County and Interstate 80 near the communities of Milesburg and Bellefonte. That is estimated to be around $217 million.

If you add those up and round them off, it adds up to more than $300 million worth of missing link projects in one county.

If you look at Attachment A on my testimony, you will see those routes located there.

As many of you know, Centre County is located in a relatively isolated rural portion of central Pennsylvania, far removed from the dynamics of big cities such as Pittsburgh and Philadelphia—and for this we are most grateful. However, this geographic separation often leaves us in a position of disadvantage when it comes to receiving a fair share of the limited funds which exist today for various infrastructure needs. As such, we call upon you today to recognize our special needs and facilitate, to the extent possible, the allocation of adequate levels of federal funding that will allow the state to complete the core system network of major arterial highways for Pennsylvania. This core system of highways includes the highways of national significance. Funding for this network will go a long way toward resolving our current and projected local transportation problems.

Detailed planning studies are currently being prepared in Centre County and the Centre Region to provide for community support systems including water, sewer and solid waste disposal. However, detailed planning for the transportation system necessary to accommodate projected travel demand and community growth patterns has not kept pace with the planning for other infrastructure systems.

In addition to travel demand generated within Centre County, the numerous state and U.S. regional highways that bisect the county serve travelers with origins and destinations far beyond Centre County. The presence of this through traffic is caused in part by the missing links and results in an even greater demand upon our local transportation system including increased levels of severe traffic accidents involving numerous fatalities. I use as an example Attachment B and also the collage to your left is an indication through the local news coverage of serious traffic accidents and fatalities just within the past year in Centre County.

The responsibility to plan for increased travel demand must be shared in a partnership, which includes the affected local communities and the state and federal governments. If we expect to meet Penn DOT's established planning priorities related to goods movement, congestion and safety.

Although Centre Countians have not always agreed on what would be the best solution to resolve our long-range traffic problems, we stand today, for the first time, united behind a strong con-

sensus that major highway improvements are needed in the Route 144, 26 and 220 corridors.

At the state level, efforts are currently underway, or are being considered, to initiate the planning, engineering and design phases of the corridor studies; however, these efforts will not advance unless adequate levels of funding can be authorized.

Although the emphasis of our testimony today is directed toward our transportation problems related to highways, please be assured that we also recognize the need for an integrated, comprehensive transportation system that includes mass transit and scheduled air service.

In summary, I would like to emphasize that Centre County has not only become a crossroads for the movements of goods and services, but has also become the hub of a very rapidly growing urban metropolitan center.

With this growth and change comes the need for costly transportation facilities and as we all know, funding becomes the key to this implementation.

We thank you at this time for your further consideration of these matters.

Mr. MINETA. Thank you very much, Mr. Donaldson. Mr. Bini.

[The prepared statement of Mr. Donaldson appears on p. 2804.]

Mr. BINI. Mr. Chairman, distinguished members of the Committee, I also would like to thank you for the opportunity to share our thoughts with you this morning.

As the Centre Region Planning Commission, we represent seven municipalities in what is commonly referred to as the Centre Region of Pennsylvania. We are vitally concerned with the ongoing partnership for surface transportation at the local level. State government plays a vital role. However, the federal government we believe is the very foundation of our comprehensive transportation planning and programming efforts. Continued federal involvement through funding for balanced local transportation programs is, from our point of view, of the highest priority.

The Centre Region is a dynamic and growing community. Our geography, as Mr. Donaldson has indicated, places us at or near the intersection of several major traffic routes. Among these are Interstate 80, U.S. Routes 220 and 322 and Pennsylvania Routes 144 and 26. These routes serve heavy volumes of interstate travel which include heavy truck traffic. This traffic is, for the most part, traveling on two-lane highways through heavily populated areas, and on highways which must also serve commuter traffic originating from or destined for the Centre Region. These routes serve commuter traffic because the Centre Region is home to traffic generators which include major employers and special events. Primary among these is Penn State University, which is rapidly becoming one of the nation's leading major research universities. Evidence of this is the University's current initiative to develop a 130-acre research and business development park which will carry them into the 21st century and continue to make the University a prime factor in the continued dynamic nature of the community. As a result, growth in the Centre Region is anticipated to be substantial, with population expected to increase nearly 15 percent by the year 2000. In turn, employment is also expected to increase

significantly. The locational and growth factors which will continue to influence the Centre Region clearly indicate the need for a highway network which can safely and efficiently accommodate the movement of goods and people both through and within our communities. Upon closer look, it becomes obvious that there are a number of missing links on our major traffic routes which must be provided if we and our neighbors in the remainder of Centre County and throughout the Appalachian Region of central Pennsylvania are to meet our system goals of improved connections to more modern highway facilities, improved safety and the reduction of growth-related congestion. These missing links can be found on various connections to Interstate 80 including Routes 220, 322, 144 and 26. The U.S. 220 link is also critical for providing a better connection to the Altoona area, Interstate 76 and western Pennsylvania.

Planning for our highway system is occurring at every level. The Highway Administration is currently exploring the feasibility of highways of national significance program. The Pennsylvania Department of Transportation is in the preliminary stages of identify a core highway system for the Commonwealth. Here at the local level, we are updating our long-range regional transportation plan to provide a balanced program of highway improvements and transportation demand management strategies. At each of these levels, highways such as U.S. Route 220, 322, 144 and 26 play key roles. For travel patterns at every level, so-called missing links have been identified through the planning process. Our ability to address these missing links will be dependent on the continued strength of the federal/state and local transportation partnership that was described earlier by Secretary Yerusalim. Likewise, federal funding has been critical to the development of an effective mass transit system in the Centre Region. Continued substantial support for transit will be essential to our strategies aimed at reducing congestion by offering viable options to the single occupancy vehicle.

The responsibility to plan for transportation needs is shared by all levels of government. The ability to implement those plans is dependent on funding, also at all levels of government. The reauthorization of the surface transportation programs in the post-interstate era is a singular opportunity, we believe, to have significant impact on funding for critical and integral highway improvements.

We believe that the substantial funds which were dedicated to the interstate system in the current Surface Transportation Act should be reprogrammed for use in now completing the highway system at the next level which will further support interstate travel, enhance our economic vitality and respond to our changing population and travel patterns over time. In addition, the Highway Trust Fund must be used only for transportation programs for highway and mass transit.

We therefore strongly support the reauthorization in 1991 of surface transportation programs in all areas. Thank you.

Mr. MINETA. Thank you very much for your fine statement, Mr. Bini. At this time, I would like to call on Mr. Robert C. Finley, Chairman of the Transportation Committee, State College Area Chamber of Commerce.

[The prepared statement of Mr. Bini appears on p. 2801.]

Mr. FINLEY. Thank you, Mr. Chairman and members of the Committee. My purpose in coming before you is to convey in very clearest terms the support of the State College Area Chamber of Commerce for the testimony presented to you this morning by Mr. Robert Donaldson, Director of the Centre County Planning Office and Mr. Robert Bini, Director of the Centre Region Planning Office.

Access to the Centre County and the Centre Region has long been criticized and joked about. The problem is real. As Mr. Donaldson and Mr. Bini have expressed, we see our highway needs as three missing links.

(1) A good limited access Route 26 between State College and Interstate 80.

(2) An improved Route 144 between Route 322 and Interstate 80 to accommodate a high volume of truck traffic.

(3) The completion of Route 220 as a four-lane limited access highway between Bald Eagle in Blair County, and Interstate 80.

The funding and construction of these missing links would provide, together with what is already in place, a very safe and serviceable highway system for Centre County and the Centre Region, a system capable of safely providing adequate connections to the interstate system, accommodating through and local truck traffic and capable of supporting the dynamic growth of the Centre Region, specifically the 15 percent increase in population expected by the year 2000. To provide these links, we see a clear need to structure future federal surface transportation programs so that dollars once used for the interstate system construction are now made available for highways which connect the communities to the interstate system.

We urge that Congress continue and strengthen the effective federal/state/local transportation partnership concept. As you can see here today, we in the Centre Region have confidence in our local planners and we commend them for their quality of work and the consensus that they have developed among our communities for our priority highway projects. Penn DOT has been an equally cooperative partner in understanding our needs and priorities and in responding to the needs of our communities. We welcome the federal government in this partnership. It has worked in the past to give us what we have today, and with some redirection in the new surface transportation programs, the partnership should be capable of meeting all of our future needs.

Again I want to state that the State College Area Chamber of Commerce fully supports the testimony given here today by Mr. Donaldson and Mr. Bini. The Chamber strongly supports the reauthorization of the 1991 surface transportation programs with consideration of our comments here today.

While we have talked primarily today of highways and the contributions of the Pennsylvania delegation to the development of highways, I must say that another hat I wear involves aviation and I would like to personally thank Congressman Clinger for his efforts in our behalf, through his involvement with the Aviation Subcommittee, and support you have given us for the development of

the University Airport, which again meets the needs of our fast developing community. Thank you, Mr. Clinger.

Thank you very much, gentlemen.

Mr. MINETA. Thank you, Mr. Finley. I would now like to call on Mr. Kenneth H. Quigley, Executive Director, Appalachian Thruway Association.

[The prepared statement of Mr. Finley appears on p. 2810.]

Mr. QUIGLEY. Good morning, and thank you, Mr. Chairman and members of the Committee. I represent a grassroots private organization that is working to improve the Appalachian corridor that begins in Cumberland, Maryland and extends for 238 miles northward through central Pennsylvania to Corning, New York. It connects eight major east-west highways and is the only major north-south highway in central Pennsylvania. And naturally the lion's share is named the Bud Shuster Highway.

There are two points I would like to make today. One is that improved highways are crucial to the rural areas of our nation. And two, that the Appalachian Development Highway System has been a Godsend for our region and under any new federal surface transportation legislation ought to be augmented or extended in some way.

First regarding why highways are so important, and I will just skim over these points. I give you more detail in the testimony.

Safety of course has got to be a prime consideration. Obsolete highways, deteriorated highways do not serve the traffic needs or become death traps. And I give you some statistics here. The highway that you traveled today outside of this motel, 220, the improved sections here, go from the Pennsylvania turnpike, and within three years will be extended, thanks to Bud Shuster, all the way to the Tyrone bypass, about 64 miles from the Pennsylvania turnpike, at which point it will empty out onto a two-lane, hilly, curving road through small towns for about 20 miles until it reaches Interstate 80. And you know what that is going to create.

In a very real way, our very lives depend on the improvements to this highway.

Secondly, the Appalachian Region of the nation has lagged behind the rest of the nation in terms of economic development and the improvements of 220 have made a major impact on the economy of this region, even though it is not yet complete. And I give details here again. A study completed by last fall showed dramatic improvements in the economy of this region. And of course, tourism is also developing in this region.

My second major point is this, that the highway development funds of the Appalachian Regional Commission have made a world of difference in this part of the world. And the nation has invested millions of dollars since 1965 in this part of the nation. However, the system is not yet complete. At the present rate of funding, the system will not be complete for another 75 years, which might have been the reason why Senator Byrd was prompted to introduce legislation that would take $2.3 billion from the trust fund and apply it to the Appalachian Development Highway System to complete the system—not a bad idea.

And thanks to your support in the House, the Appalachian Regional Commission has survived a full eight years of the Reagan

administration's attempt to abolish it. And thanks to Congressman Shuster, we have been able to address some transportation needs beyond what the Appalachian Region has been able to do.

The job is not done. As you redraft the surface transportation act, we ask that you consider the importance of the rural areas. We cannot compete in terms of traffic volumes, but we certainly need the access to the rest of the nation. And secondly, the Appalachian Regional Commission Development Highway System has been vital to us, and in some way, if you are going to address it in this legislation, please extend it and augment it.

Thank you very much.

[The prepared statement of Mr. Quigley appears on p. 2890.]

Mr. MINETA. Thank you very much, Mr. Quigley, for your very fine statement and for the statement of the other members of the panel.

Mr. Donaldson, I would like to ask you, a strong consensus for major highway improvements for Routes 144, 26 and 220 corridors has been developed by folks here in Centre County. If special federal funding is not provided for the needed improvements along these corridors, what kind of alternative funding sources are available for Centre County?

Mr. DONALDSON. I am not sure I really have an answer to that one. We are dealing more with the planning and the design and engineering and we are pretty dependent upon the state and the federal government. Portions of these systems can possibly be encouraged to use the Pennsylvania partnership program, but by and large, these missing links are not in urban areas and do not have potential for a lot of urban development where you would have developers willing to come in and put up their local share, so that—I guess from my point of view representing a rural county, we are almost totally dependent on federal and state governments to provide the funding for projects of this magnitude. We simply do not have that kind of dollars available at the local level.

Mr. MINETA. Very well.

Mr. Hetherington, toll roads are a viable component of the interstate system. You have already exhibited that here in the Commonwealth of Pennsylvania. However, many states have not advanced toll projects within their own states and I am wondering, do you believe that the federal government should encourage the construction of toll roads, and let us say the mixture of federal funds to leverage on the encouragement of construction of toll roads?

Mr. HETHERINGTON. Yes, sir, I do, Mr. Chairman, simply because of what has been demonstrated so far. The federal aid system cannot do everything. Partnership is very, very important, but the toll road system that has been proven is equally important. I think that integration can work very, very successfully if there is encouragement and there is some federal support of those toll facilities to be extended. I understand there is about 1,200 miles of toll roads either on the design boards or under construction at the present time around the United States.

Mr. MINETA. Mr. Shuster.

Mr. SHUSTER. I want to thank the panel very much for your excellent testimony. I have no questions, Mr. Chairman.

Mr. MINETA. Mr. Hammerschmidt.

Mr. HAMMERSCHMIDT. No.

Mr. MINETA. Mr. Roe.

Mr. ROE. No questions.

Mr. MINETA. Mr. Clinger.

Mr. CLINGER. Thank you, Mr. Chairman. I just would like to welcome the panel and thank them for their testimony. I can say that this panel has done a great deal to sensitize me and educate me to the needs that the Centre Region has, specifically with regard to 220. I particularly want to welcome my three constituents, the three Bobs, Bob Finley, Bob Donaldson and Bob Bini, for being here today.

Just one quick question and that is, you alluded to one thing that I think needs to be stressed and that is we have now through Bud Shuster's good work developed 220 quite well. The gaps that you mentioned, however, if those gaps are not filled, is it not going to—the fact that it has been improved too much, is that not going to exacerbate the problem in terms of congestion in the Centre Region? Bob. Any Bob.

Mr. DONALDSON. I kind of look at this 220 in particular as a funnel and the open mouth is on both sides of us and we are kind of the constraining part of the funnel. And I think the majority of those accidents over there are down on 220 and it simply means that there is going to be an ever-increasing amount of vehicles attracted to 220, it is doing what it was intended to do, and as such we have become probably the last missing link. So that whatever accident rate we have today, we are going to see it multiplied many times in the future. And this traffic goes through small communities including Bald Eagle, Port Matilda, Julian, Unionville, Wingate and Milesburg, et cetera, et cetera. And these little communities simply cannot handle in any way this increase in traffic.

Mr. CLINGER. Thank you all, gentlemen.

Mr. MINETA. Mr. Murtha.

Mr. MURTHA. No questions, Mr. Chairman.

Mr. MINETA. Questions from other members of the panel? Mr. McEwen.

Mr. MCEWEN. Mr. Chairman, 60 seconds if I may. Thank you all for your testimony, particularly Mr. Hetherington. If I could encourage you through your network of friends throughout the states, to ask one favor. As you are aware, there is a conspiracy between various administrations and the Appropriating Committee in the Congress to back up those funds in the trust funds rather than to use them for the purpose which allows the trolls under the bridge in the Ways and Means Committee to have eyes upon how to divert those funds to various other ideas that they may have. And as a result, we have protested against the backloading of those trust funds, but we have held our foot strongly against the door of diverting the funds for highways and airports that our trust fund accounts are allocated precisely for that purpose, from any attempts to be raided. Thus far, the funds are growing but they have not been stolen as yet. But lo as we speak this very moment, evil forces are at work at Andrews Air Force Base and there is a distinct possibility that before this week is up, there will be a package that will seek to divert those funds, though badly needed for infrastructure, for the purpose of some other great social goal.

I happen personally to believe that Franklin Roosevelt was onto something when he took people who were unemployed and homeless and said we will teach you skills and build bridges and highways and dams for America, and we will put you in uniform and teach you respect and self-worth and defend our country as well, so when they retired they had skills and America was protected and free and had something to which they could point. There is a strong competition in the Congress to divert from defense and from infrastructure to what is called social goals. And I happen to have watched those over time and I have difficulty putting my finger on what America gets exactly from them, and happen to think that a bridge or a highway would be more tangible, not only from them learning to work and having a skill, but also having passed on to our future generation.

Therefore, I am not sure how tight the package is going to be bound, but I shall do all within my power when it comes, that if there is an effort to take the highway and airport trust fund allocated accounts and taxes and divert them for these other goals, that I hope that you and all that are dependent upon it will do all within your power to contact the Congress as aggressively and forcefully and rapidly as possible, to say that this is a step that the Congress should not take because I fear that if it is done, that perhaps hell will freeze over before we get those funds back.

And therefore, I thank you for your testimony and solicit your support.

Mr. HETHERINGTON. Thank you very much, Mr. McEwen, we appreciate it very much. We appreciate what the Committee has done to help hold those funds for highway purposes only and aviation and transit. Thank you.

Mr. MINETA. Members of the Committee, any others who wish to address questions?

[No response.]

Mr. MINETA. If not, let me thank the panel very, very much for your fine statements and for your contribution to our enlightenment. Thank you very much.

I would now like to call on Henry L. Heck, Executive Vice President, Associated Pennsylvania Constructors. Mr. Heck, your full statement will be made a part of the record, and so if you would go ahead and proceed in your abbreviated statement.

TESTIMONY OF HENRY L. HECK, EXECUTIVE VICE PRESIDENT, ASSOCIATED PENNSYLVANIA CONSTRUCTORS

Mr. HECK. Thank you very much, Mr. Chairman, and good morning to you and the other distinguished members of the Subcommittee. For the record, my name is Henry L. Heck and I am Executive Vice President of the Associated Pennsylvania Constructors, which is based in Harrisburg.

I am pleased to present testimony today on the transportation needs of this nation and the relationship of the Surface Transportation Act of 1991 to meeting those needs.

APC has been representing Pennsylvania road builders, material suppliers, equipment dealers, engineers and others involved in the

transportation industry since 1927. We have approximately 600 member firms.

I am also here today on behalf of the American Road and Transportation Builders Association (ARTBA), APC's national association.

Mr. Chairman, on behalf of our membership, thank you for inviting me to provide our views on future transportation needs, identification of problems in the current program and proposals for new program structure and funding. At the outset, I will say that we believe that the financial decisions that Congress makes next year in the transportation area will have a direct impact on the nation's economy and well-being long into the future.

Today, America's federal highway system—the backbone of our national economy—is in serious trouble.

According to the U.S. Department of Transportation's 1989 report to Congress, more than 28 percent of the bridges on the federal-aid system were either structurally deficient or functionally obsolete. The same report states that more than 40 percent of the pavements on the federal-aid are in poor or fair condition. You can see that by the figures attached, 1, 2 and 3.

The Associated Pennsylvania Constructors believes the reauthorization bill drafted by this Subcommittee should provide $40 billion per year for the highway and bridge improvements. This authorization level should commence in 1992 and continue for a minimum of five fiscal years thereafter. Such a program level is totally consistent with the needs identified by the U.S. Department of Transportation, referred to earlier in our testimony.

To authorize and carry out a program of this magnitude, we recommend that the Congress ensure that all federal highway user fee revenue contributed to the highway trust fund plus interest earned on that money is spent in a timely manner. A drawdown in the trust fund's current $10 billion-plus cash balance should begin during the next fiscal year.

Remove the federal-aid highway program from the unified federal budget in order to ensure that revenues are not impounded or withheld in the future.

Increase the federal highway user fees, effective in fiscal year 1992, to raise the additional $25 billion per year that is necessary for a $40 billion per year federal program of highway improvement assistance.

No longer impose artificial obligation ceilings on the expenditure of federal highway funds.

Repeal the current six cents per gallon federal tax exemption on gasohol sales for highway vehicle usage, which causes an estimated $500 million per year loss to the highway trust fund; and

Tighten federal highway motor fuels collection procedures.

These actions would assure that future generations have a highway system on which they can build.

Proper investment is the key to meeting future highway needs.

Let me turn to APC's views regarding program structure and allocation of resources. If you will turn to page 19 of my testimony, there is listed the various categories of spending. The amount recommended is listed there and I will only touch on what the recommended matching ratio—federal/state matching ratio should be.

First of course is completion of the interstate highway program and we recommend a one-time $5 billion authorization.

Next is protecting the interstate highway investment and this is to set a federal/state funding ration for interstate 4-R at 90/10.

Rebuilding our bridges, set the federal/state funding ratio at 90/10.

Creating a regional primary system, set the federal/state funding ratio at 90/10.

Next is metropolitan area assistance program, that should be a ratio of 70/30.

Create a new transportation corridors program, the matching ratio should be 70/30.

Mobilize rural America and that should be a match of 70/30.

And also APC recommends increasing the federal highway safety funding to $2 billion per year and investing in research at $2 billion per year.

Other issues that are—I see that I am out of time and the balance of the other recommendations we hope that you will look at and consider seriously.

We do appreciate the opportunity to be here today and I will be ready to answer any questions that you may have.

[The prepared statement of Mr. Heck appears on p. 2813.]

Mr. MINETA. Mr. Heck, thank you very, very much. And I want to commend APC as well as your national association, the American Road and Transportation Builders Association, for the leadership that both organizations have played in developing highway and transportation infrastructure programs.

Mr. Heck, the Associated Pennsylvania Constructors support the authorization, as you have indicated here, of an annual federal-aid highway program of some $40 billion, as you indicated on page 19 of your testimony. Have you thought about how much of an increase in excise taxes on motor fuels would be required to support an annual program level of that amount?

Mr. HECK. Yes, sir, that has been given consideration. Of course the recommendation is to add $25 billion to the current level of income which produces basically about $15 billion. To do that with the drawdown of the existing funds and some other sources, it would probably be the equivalent of maybe 18 cents a gallon in federal user fee increases.

Mr. MINETA. And what is the state or Commonwealth of Pennsylvania's present gasoline tax here?

Mr. HECK. Our gasoline tax right now is 12 cents a gallon, but we also have an additional six percent on the wholesale price of fuel, which currently generates about 5.5 cents a gallon.

Mr. MINETA. And are there any exemptions for any kind of fuels, any lower fee for diesel or any other——

Mr. HECK. No, sir. As a matter of fact, diesel is a little bit greater.

Mr. MINETA. Now APC, I see, has proposed varying federal matching requirements for the categorical federal-aid highway programs. Why is there a need to increase certain categorical federal matching requirements and reduce others?

Mr. HECK. I think this was based on the needs as we perceive them. These come from discussions with the State Department of

Transportation as well as with our national association, and these were the recommendations based on the perceived needs.

Mr. MINETA. Do you think that in some instances we have the chasing of federal funds because of that matching ratio? I mean here is 90/10, here is 70/30, here is—someone in the state planning office says gee, all we have to do is put up $10.00 here and we will get $90.00 of federal funds. If we put up $30.00, then we get $70.00. Let us put our money here with the $10.00 programs rather than the $30.00. Does that tilt decision-making?

Mr. HECK. I really do not believe it does that much. I think where the greater needs are and priority of needs I think have the larger matching ratios. The other areas are ones that can be achieved as well.

Mr. MINETA. Mr. Shuster.

Mr. SHUSTER. Thank you very much for your testimony, Mr. Heck, I have no questions.

Mr. MINETA. Mr. Hammerschmidt.

Mr. HAMMERSCHMIDT. No questions.

Mr. MINETA. Mr. Roe.

Mr. ROE. No questions.

Mr. MINETA. Mr. Clinger.

Mr. CLINGER. No.

Mr. MINETA. Mr. Murtha.

Mr. MURTHA. No questions, Mr. Chairman.

Mr. MINETA. Any questions from other members of the panel?

[No response.]

Mr. MINETA. Well Mr. Heck, thank you again very, very much for your testimony. It is a very fine statement and I know I will have a chance to take a look at it in depth.

Mr. HECK. Thank you.

Mr. MINETA. At this time I would like to call on a panel made up of Mr. William B. Newman, Vice President and Washington Counsel for Conrail; Mr. Michael A. Giansante, Jr., Local Chairman, International Brotherhood of Electrical Workers; Mr. Dennis R. Appleman, Local Chairman of the International Association of Machinists and Aerospace Workers; Mr. Thomas D. Lutton, President, Transport Workers Union of America and Mr. Allen T. Butterbaugh, General Chairman, Local 105 of United Railroad Supervisors Association. Gentlemen, it is a pleasure to have all of you here at the hearing. And Mr. Newman, if you would go ahead and proceed in your own fashion.

TESTIMONY OF WILLIAM B. NEWMAN, JR., VICE PRESIDENT AND WASHINGTON COUNSEL, CONRAIL; MICHAEL A. GIANSANTE, JR., LOCAL CHAIRMAN, INTERNATIONAL BROTHERHOOD OF ELECTRICAL WORKERS; DENNIS R. APPLEMAN, LOCAL CHAIRMAN, INTERNATIONAL ASSOCIATION OF MACHINISTS AND AEROSPACE WORKERS; THOMAS D. LUTTON, PRESIDENT, TRANSPORT WORKERS UNION OF AMERICA AND ALLEN T. BUTTERBAUGH, GENERAL CHAIRMAN, LOCAL 105; UNITED RAILROAD SUPERVISORS; AND PETER LaPOINTE, VICE PRESIDENT, EASTERN AMERICA TRANSPORT AND WAREHOUSING, ON BEHALF OF HAULERS AGAINST LONGER TRUCKS

Mr. NEWMAN. Thank you, Mr. Chairman. I am very delighted to be here, Mr. Shuster and other distinguished members of the panel.

My name is Bill Newman, I am Vice President and Washington Counsel for Conrail and I am accompanied by Brian Vogel of the Association of American Railroads and four of my fellow Conrail employees; Dennis Appleman, who is Chairman of Juniata Local Number 1639 of the International Association of Machinists and Aerospace Workers; Allen T. Butterbaugh, General Chairman of Lodge 105 of the United Railroad Supervisors Association; Michael Giansante, the Local Chairman of the International Brotherhood of Electrical Workers; and Thomas D. Lutton, President of the Transport Workers Union of America, Local Union 2017.

We are here to strongly urge the Congress not to increase the limit on the weight and size of trucks allowed to travel our nation's highways.

We start by noting the substantial unused capacity in the rail network which can be part of the resolution of the many serious problems with our nation's transportation infrastructure. The growing congestion and pollution problems and fuel consumption associated with highway traffic can be alleviated by greater use of the non-congesting, environmentally benign, fuel-efficient rail mode. Equally as important, greater use of the rail network will permit the limited resources in the highway trust fund when compared to the infrastructure investment demands to be invested so as to maximize the use of these scarce tax dollars. The key to greater utilization of the rail mode is not to further tilt public policy against the rail mode. We believe that authorizing the use of longer combination vehicles would tilt public policy against the rail mode so as to seriously threaten the rail industry and foreclose the opportunity for the public sector to capitalize on the rail industry's investment in infrastructure in the face of serious questions about the safety of such vehicles, that has led to documented public opposition to them.

The Association of American Railroads has estimated that the railroad industry would lose nine percent of its revenues and 52 percent of its net operating income to longer combination vehicles if they were authorized. Some of that income would be lost from the LCVs outright. More would bleed away because of rates forced down to artificially low levels as railroads try desperately to hold onto as much traffic as possible. Remaining rail customers would

have to pay a higher and larger portion of the cost to maintain the industry's fixed assets.

Because Conrail's markets are highly truck competitive, we estimate that up to 40 percent of our revenues—about $1.5 billion—could be lost to longer combination vehicles. Twin 48s and triple 28 combinations, for example, can hold as much as 140 percent of the cubic capacity of the rail industry's standard boxcar.

The results of such a dramatic decline in revenue and income would be devastating for Conrail, and more importantly, for its employees. Here in Blair County, for example, Conrail employs more than 1,700 people—approximately 1,200 in its major locomotive repair and freight car repair shops and another 500 in train service, track maintenance, supervisory and clerical positions. A 40 percent reduction in revenues would force Conrail to reduce expenses commensurately, thereby leading to the commensurate reduction in Conrail jobs here in Altoona because less traffic demands less trains, fewer trains demand fewer train service employees and less locomotive and freight car use results in fewer jobs for the employees who maintain that equipment and finally, fewer employees means less revenue to the railroad retirement fund. In short, Altoona, a city which is steeped in railroad history, would be on the vanguard of absorbing the economic havoc longer combination vehicles would rain upon the rail industry.

Longer combination vehicles at weights up to 135,000 pounds, compared to the current 80,000 pound limit, represent an economic burden for our nation's already exhausted highway and bridge network, and a serious threat to the safety of the motoring public as well. That is why the AAA, the Advocates for Auto and Highway Safety, the American Insurance Association, the Sierra Club, the Joint Council Number 7 of the Teamsters, and the National Taxpayers Union have all testified before your Subcommittee in strong opposition to longer combination vehicles.

Hidden behind the smokescreen of the trucking industry's claims of higher productivity is the fact that rail-competitive trucks now substantially under-pay for the damage they do to our nation's roads and highways. FHWA and numerous states have documented the fact that rail competitive trucks pay only 55 to 60 percent of the damage they cause to the highway network and that under-payment is calculated on a direct cost basis. If the indirect, the social and the capital costs of heavy trucks are calculated, that under-payment would escalate rapidly. That is not productivity, it is a subsidy because it allows trucks to offer lower rates without footing the entire bill, placing railroads at a public policy disadvantage and saddling the nation's motorists with the burgeoning cost of repairing our highways.

But these under-payments pale in comparison to the issue of the safety of the motorists who must share the highways with increasingly larger and heavier trucks. Trucks already account for nearly a third of all fatal highway accidents. Numerous independent studies and many professional truck drivers, have raised serious questions about the ability of double and triple trailer combinations to be operated safely.

I am out of time, so I yield to my fellow panel members.

Mr. MINETA. Thank you very much, Mr. Newman. Let me ask if any other members of the panel—let us see, Mr. Giansante, if you would——

[The prepared statement of Mr. Newman appears on p. 2877.]

Mr. GIANSANTE. I was afraid you would call on me first. [Laughter.]

I just have a couple of short comments to make.

Number one is that what Mr. Newman says here is very true about losing business. When we lose business, our work in Altoona and Hollidaysburg is predicated on business. Our programs for our locomotive repair and our car repair naturally goes in line with what kind of business we are going to have this year.

So in them terms, we would lose a substantial amount of employees. This really gets compounded later on because it is a huge machine down there. You have to feed it. How you feed it is keep the overhead down and I am sure you gentlemen are aware of that, is by spreading out product. If the product is not coming in, now the question has to be asked does it pay to keep these facilities open. That is a real concern of mine. It is a real concern of all the other local chairmen here, I am sure they will tell you about that there.

I can remember in 1972 when Penn Central went bankrupt and I was working for them at that time. I can remember going home that night and telling my wife at the supper table that, you know, this is it, this is my last check. Here we are, what, 18–19 years later and I have not missed a check yet. This is another fight for us and I am sure you gentlemen know about the fights that we went through with Conrail and Norfolk Southern and you know, just getting money to make Conrail Conrail. You gentlemen helped up there, and I know Bud done a tremendous job.

What I am asking is we would appreciate your support to go against these triples because it would really devastate us here.

Thank you.

Mr. MINETA. Thank you very much. Mr. Appleman from the IAM.

Mr. APPLEMAN. Good morning, Mr. Chairman, and panel. I am Dennis Appleman, I represent the machinist craft both in the Altoona shop and the railroad division. Also I belong, along with the machinists, to District 19, which is the last railroad district across the country.

We feel that this trucker legislation issue will adversely affect the Altoona shops and reduce our present work force, both in the shops and the railroads across the country. I am here this morning to ask for your support and we would really appreciate further support from our political people on this trucker legislation.

Mr. MINETA. Let me call on Mr. Lutton, President TWU, Local 2017.

Mr. LUTTON. Mr. Chairman, panel members, I again support what my other brothers have been saying about the triple trailers and the double 48s. That would devastate our area here, not only our working force, but the railroad retirees that we have several thousand in this area alone.

With the work going away to the tractor-trailers, the amount of employment will naturally go down, as we have said, which again

would need further support of the railroad retirement system, which again you people know that we have trouble with right now.

I recommend that you do not support the triple trailers and I thank you.

Mr. MINETA. Thank you very much. Now I would like to call on Mr. Allen T. Butterbaugh, the General Chairman, Lodge 105 of the United Railway Supervisors Association.

Mr. BUTTERBAUGH. Mr. Chairman, members of the Committee, I will not be facetious when I do read my short statement, but rather my perception if you do enact a law allowing bigger trucks to haul more on our highways, because if the trucks and carriers are allowed to haul double 48 foot trailers and triple 28 foot trailers over our highways, that will increase the future annual highway death toll, safety being our utmost concern here.

The present safe highways will actually turn into a similar death row as the American automobile travelers and their passengers will not know the date of their execution until it untimely comes to a tragic end.

Secondly, the present railroad work force, which is somewhat stable after a decade of cutbacks and many sacrifices, will have to undergo further restructuring because if the trucks are allowed to haul more, we may realize a 40 percent reduction in our business. And with a 40 percent reduction in our business, that means loss of employment. And with loss of employment, that also means less contributions to our retirement funds that are now in force.

And on a weekly basis, that is 12.55 percent per employee of their wages. That is the employees' contribution share, as well as the employers over and above that, which you may look at it in the sense of present workers now are taking care of those retired railroaders and their spouses in the nation today and hopefully the upcoming railroad employment will take care of our retirement and our spouses in the future.

So therefore, I ask you and I strongly urge you to vote against allowing big trucks to haul more freight on our highways.

Thank you, Mr. Chairman and Committee members.

Mr. MINETA. Thank you very much, Mr. Butterbaugh.

Let me at this point introduce Peter LaPointe, who is the Vice President of Eastern America Transport and Warehousing, who has a statement. Mr. LaPointe, your statement will be made a part of the record if you would go ahead and proceed in your own fashion, sir.

Mr. LAPOINTE. Good morning, Mr. Chairman. I appreciate this opportunity to appear before the Subcommittee.

Again, my name is Peter LaPointe. I am Vice President of Eastern America Transport and Warehousing which is headquartered in Philadelphia and operates facilities and delivers goods along the east coast from Maine to Virginia.

Among its motor carrier services, Eastern America provides transportation for trailers and containers having a prior or subsequent move by either rail or steamship. This aspect of the transportation business is known as intermodalism.

I appear before the Subcommittee today in behalf of HALT, Haulers Against Longer Trucks. HALT is a nationwide coalition of motor carriers who rely substantially, and in many cases exclusive-

ly, on transporting trailers and containers involved in intermodal service for their livelihood.

Mostly, these firms are small, family-owned and operated businesses. They are concerned that the enactment of any law increasing federal maximum truck weight limits above the current 80,000 pounds would foster widespread use of longer combination vehicles known as LCVs on our nation's highways. Use of such vehicles would put most, if not all, of these entrepreneurs out of business.

In lieu of legislation which would relax our weight laws and sanction the use of twin 48 foot trailers and triple 28 foot combinations, intermodal truck operators urge the Congress to enact a bill which fosters the growth and expansion of intermodalism.

Mr. Chairman, intermodal trucking achieved great success during the 1980s riding the wave of extraordinary growth in this industry. Intermodal trailer and container movements grew from three million loads in 1980 to more than six million by the end of the decade. However, while the growth is impressive, the competitive environment, versus truck, in our industry resulted in this business producing only marginal profits for the railroad industry.

Much of the business railroads handle in domestic intermodal service is extremely susceptible to truck diversion. Consequently, any Congressional action allowing the trucking industry the right to use longer combination vehicles as a consequence of higher fuel taxes would have a devastating economic impact on rail intermodal—and by extension on this segment of the trucking business.

Studies by the railroad industry estimate that just the initial impact of twin 48 foot trailers would mean a loss of nine percent of all rail ton miles and 52 percent of net operating revenues, based on 1986 figures, the most recent available.

Intermodal is hurt far worse than the average. Railroads would lose 23 percent of intermodal traffic and 27 percent of intermodal gross revenues if twin 48s were legalized.

The long-term impact of the lost net revenue would be even greater intermodal diversion. Rail intermodal is dependent on expensive fixed facilities. With the loss of over a quarter of intermodal revenues, many of these facilities no longer would be economically viable.

According to several senior rail marketing officials, if railroads—I am sorry, I guess I am out of time, so I will just leave my comments in writing.

Thank you very much.

[The prepared statement of Mr. LaPointe appears on p. 2871.]

Mr. MINETA. Thank you very much, Mr. LaPointe, I do appreciate your cooperation on this. Your statement will be made a part of the record.

Let me ask at this point the Conrail panel, what is the significance of the unused capacity in the rail network for improving the movement of freight. Mr. Newman.

Mr. NEWMAN. Mr. Chairman, we believe that we can take our unused capacity and take vehicles off the highway system, thereby reducing the amount of capital expenditures that have to be made out of the highway trust fund, thereby giving a benefit to consumers, giving a benefit to the taxpayers, benefiting everyone through

greater use of our facility. Our infrastructure is there and it is well-maintained and it is ready to move the traffic.

Mr. MINETA. Now the trucking industry of course talks about productivity gains if we take that 80,000 pound limitation off. What you are saying is that that would adversely affect the rail dependent industries in terms of transporting their goods.

I am wondering if you could maybe give us some more specific examples of where you see that happening, as far as that kind of loss that would adversely affect the rail industry.

Mr. NEWMAN. Sure. The rail industry moves a number of commodities. We move everything from intermodal trailers and containers all the way up through the bulk commodities; coal, chemicals, aggregates, those types of things. Every commodity makes a contribution toward covering the railroad's overhead. To the extent we lose the truck competitive traffic, we still have that overhead, albeit we will try to reduce it over time. But to the extent we lose it, the people who are dependent upon the railroad would have to pay to cover that overhead, at least in the short run and that would result in higher rates.

Mr. MINETA. Mr. LaPointe, in your fine statement, you indicate that you are a provider of intermodal transportation services. Does HALT support changes to the existing federal bridge formula which limits axle loading and spacing?

Mr. LAPOINTE. At this time, no, they do not.

Mr. MINETA. Thank you, Mr. LaPointe.

Mr. Shuster.

Mr. SHUSTER. I want to thank the panel very much for your outstanding testimony. Mr. Chairman, we have been through many wars together over the years with these guys out here, and it is just good to hear their fine testimony.

Thank you.

Mr. MINETA. I am not sure who is worse for the wear, but it seems to me you have done well by that battle.

Mr. Hammerschmidt.

Mr. HAMMERSCHMIDT. I do not have any questions, Mr. Chairman, but I want to thank this panel for bringing us extremely important testimony. You have made your point very well with it, and we appreciate it.

Mr. MINETA. Mr. Roe.

Mr. ROE. Yes, Mr. Chairman, I do have a question.

First of all, I want to compliment the panel for the exceptional testimony because I think this is one of the most important issues that is going to be facing us down the road in the next six months.

Let me be the devil's advocate. The response we are going to get form other interested people, which is the American way, is going to come back and say well I do not know why you people are all upset. After all, we are buying commodities cheaper if we can ship them by truck and so forth and so on, and therefore, it is going to be more expensive in the rates as far as the railroads are concerned, why should the American people not be getting a better cost on their commodities because they can do it cheaper by truck.

Exclude safety—I am leading to a point, of course—exclude safety. So the American system has come back and said well look, why should we not—we are trying to improve competitiveness, that

is the big buzz word politically today and so forth and so on, we can do it better and faster by truck and commodities, you know, groceries and flour and bread and the things that people need are going to be a lot less expensive. Why should we go ahead and not do that in our trucking system.

Mr. Newman.

Mr. NEWMAN. I think the reason is that the existing user fee system is the answer. And that is the rail competitive trucks, trucks that are let us say greater than 73,000 pounds, are only paying 55 to 60 percent of the damage, on a direct cost basis——

Mr. ROE. Who says that?

Mr. NEWMAN. FHWA, sir.

Mr. ROE. Okay.

Mr. NEWMAN. FHWA and a number of states which have looked at the whole question of highway cost allocation in the last decade. And they come back, each and every one of them, and say that the heavy trucks are under-paying. As I say, if you made them pay for the capital, which in the private sector you would have to pay for as well as the indirect costs and the social costs, that number swells.

Mr. ROE. I wish we had more time. I realize we are on a very tight schedule, but I would like to develop this issue further.

For example, part of the argument goes that out in Montana and Wyoming and these more open states, why should we not have a dual system where they can go ahead and run through those areas with heavier loads and so forth and so on. The argument arose on the 55 versus 65 mile an hour issue, if you recall, when, God rest his soul, Jim Howard was alive, where the western states came back and screamed bloody murder and said it is going to cost us more, it is ridiculous for us to be driving at 55 miles an hour when we have much greater distances to travel and the safety factor does not come into it.

Without taking more time, Mr. Chairman, I would hope—and I have talked about this with Bud, who I think happens to be one of the great leaders in this area—I would think that we would have to develop more specifics on this particular issue to make it stick as far as national policy is concerned. I happen to be on the side of limiting the trucking because in a heavy urban state like New Jersey, we have got a million problems with safety and so forth. But I do not think just to say it is going to be enough.

I think if we were comparing rail rates with truck rates, we ought to counter that and come back and say if you were to ship this type of commodity in this type of a quantity this distance and these other figures were involved, the trucking added costs were involved, this would be what the national rate should be on that commodity being shipped, whether you shipped it by truck or rail. I think that case is going to have to be made if we are going to be able to protect the issue that you are speaking to.

Thank you, Mr. Chairman.

Mr. MINETA. Mr. Clinger.

Mr. CLINGER. No questions, Mr. Chairman.

Mr. MINETA. Mr. Murtha.

Mr. MURTHA. No questions, Mr. Chairman.

Mr. MINETA. Questions from other members of the panel?

Mr. NEWMAN. Mr. Chairman, excuse me. I mentioned a study in my testimony by Scientex. I would ask the Subcommittee if I could have an executive summary of it included with my testimony.

Mr. MINETA. Without objection, that will be done.

Mr. NEWMAN. Thank you.

[The data referred to by Mr. Newman concerning Scientex appears on p. 2883.]

Mr. MINETA. Mr. Newman, very quickly, on page 5 of your statement, you say trucks already account for nearly a third of all fatal highway accidents. I thought drunk driving was in that proportion rather than trucks themselves. I was wondering if you might be able to expand on that.

Mr. NEWMAN. If I could yield to Mr. Vogel please.

Mr. VOGEL. I think perhaps a better way of saying it would be that trucks are involved in a third of all fatal highway accidents. There may be some overlap between the two categories.

Mr. MINETA. Well let me thank the panel very much for your presentation here today, and I know that we will continue to see many of you in the future as we are developing the legislation. Thank you very, very much.

At this time, I would like to call on Mr. Bill Ward, Chairman of the Board of Ward Trucking Corporation, Altoona, Pennsylvania.

Mr. Ward, your full statement will be made a part of the record, so I would appreciate your abbreviated statement. If you would proceed in your own fashion, sir.

TESTIMONY OF G. WILLIAM WARD, CHAIRMAN OF THE BOARD, WARD TRUCKING CORP., ON BEHALF OF PENNSYLVANIA MOTOR TRUCK ASSOCIATION

Mr. WARD. Thank you, sir. Good morning, gentlemen. My name is G. William Ward, and I am Chairman of Ward Trucking Corporation here in Altoona. My testimony today will represent the views somewhat of my company, but more importantly of the Pennsylvania Motor Truck Association and the American Trucking Association.

Mr. MINETA. Mr. Ward, if you could introduce your colleague, I would appreciate it.

Mr. WARD. I will do so. Here with me today is Robert E. Farris, Vice President for Policy of the American Trucking Association, and former Federal Highway Administrator.

Mr. FARRIS. Good morning, gentlemen.

Mr. WARD. Many issues have been identified, which are critical to the future of my industry and those will be included in the information which is made available to you.

But let me maybe begin by giving you some idea of how vast this industry is in the State of Pennsylvania. We employ about 350,000 people directly in my industry here in the state. Locally here in Altoona, for example, my company employs in excess of 250 people. Eighty percent of all Pennsylvania communities are entirely dependent on truck traffic—80 percent. That figure decreases slightly to about 60 percent when you talk about the entire country.

Trucks pay about $334 million into the federal highway trust fund representing well over 58 percent of all the federal receipts from these vehicles.

Given these figures and others that are equally as impressive, it is more than fair to conclude that the economic well-being of the trucking industry is an essential element to the economic vitality of Pennsylvania and the nation as a whole.

Earlier I mentioned a word—that is, in my testimony which you will receive, I mentioned a word which is key to me and to my industry, and that is "productivity." There has been much discussion about that here this morning. Along with productivity, our industry continues to be vitally interested in safety.

This very day as we speak, has been designated as Citizens' Day and perhaps the single most important thing the trucking industry does as a corporate citizen is to strive to operate safely. Clearly an industry as large as I have just described, there are drivers and companies that at times compromise safety. These are the exceptions, however.

As you are well aware, there are people in competitive modes that would have you believe that the total disregard for safety is a standard operating practice in my industry. This is simply not true. In my own company, I know the extent to which we go in driver training, screening of drivers, drug testing and all of the other things which we feel play a vital role in safe operation of our trucks.

Let me provide you with a short list of some of the safety areas where the trucking industry, in my view, is taking a leading role. The commercial driver's license, so-called CDL, which as you know by April 1 of 1992 every driver in the United States operating a vehicle in excess of 26,000 pounds will have to prove that he or she can safely operate that truck.

Number two, roadside safety inspections, at our urging, the urging of our industry, those have increased by a thousand percent since 1986, to a current level of over a million inspections per year.

The elimination of the commercial zone safety exemption, this is an item which is very near and dear to those of you from our nation's capital. And that is thus ending about 20,000 interstate areas where poor drivers and unsafe drivers were permitted to operate undetected.

We support the elimination of drugs and alcohol for all truck drivers and yes, we even support the random drug testing of our drivers. We have had some problems with that with some California legislation which we are hoping we can get on with the random testing, but in my own company, drug testing is part of the pre-employment physical and that is repeated then when the drivers go for their annual test for continuing to have their operator's license.

We support the 55 mile an hour speed limit. We have governors on our trucks, for example, which will not permit them to go over 55 miles an hour. We use safety patrols and other items which we hope will control the speed of our vehicles. Much more efficient for us, much safer. So I want you to know that the industry as a whole does support that.

We actively oppose the use of radar detectors. In our view, there is only one reason for that radar detector and that is to warn of an officer out ahead that is going to clock what you—the speed you are traveling.

And we are actively working on research for driver fatigue, very important part of our problem.

We have recently called for the elimination of the sale of alcoholic beverages at truck stops. Hard to believe that there are trucks stops in this country where that is permitted.

What can you do to help us? In my view, you can promptly reauthorize the multi-year federal-aid highway program including provisions that create a new network of highways of national significance consisting of 140,000 to 180,000 miles which will effectively connect all the nation's population centers and accommodate approximately 45 percent of all the traffic movements, including 70 percent of all the commercial traffic.

I have more, but my time has run out. I appreciate this opportunity. I welcome you again to our city, Bud and your group, and again thank you for this opportunity to present my views on my industry.

[The prepared statement of Mr. Ward appears on p. 2901.]

Mr. MINETA. Thank you very much, Mr. Ward, and it is good to have Mr. Farris here with you.

The Commonwealth of Pennsylvania and several other states have addressed their highway transportation needs with the construction of toll roads. I am wondering if you could explain to the Committee why the American Trucking Association strongly opposes any new tolls on existing roads and the mixing of highway trust fund dollars with toll bond funds?

Mr. WARD. In my company—I will address it from a local viewpoint, if I may. Your question was about American Trucking Association and perhaps Mr. Farris can enlighten me on that. But in my company, we use the toll roads—to a large extent the turnpike and other areas. We object to putting tolls on Interstate 80, for example, which is another primary artery for us, because we feel that those roads have already been paid for by our tax dollars, and to toll those at this point does not seem to be fair to us.

Personally, I would support the tolling of new highways, but I do not support the tolling of existing highways.

Does that answer your question, sir?

Mr. MINETA. Yes, it does. Mr. Shuster.

Mr. SHUSTER. Thank you very much. Mr. Chairman, Bill Ward is one of the real leaders and statesmen of the trucking industry and it is just a pleasure to have you testify Bill and to see Mr. Farris as well. Thank you very much.

Mr. MINETA. Thank you. Mr. Roe.

Mr. ROE. No questions, Mr. Chairman.

Mr. MINETA. Mr. Hammerschmidt.

Mr. HAMMERSCHMIDT. Thank you, Mr. Chairman.

Mr. Ward, we appreciate your testimony. It is good to see Bob Farris with you, to see him before our panel again. I notice in your written statement you touched on a very important subject that Chairman Mineta has a great interest in, and that is sub-optimally designed pavement, highway design in general and the economies

of scale in building stronger and thicker pavement structures. We do not have time to get into that, but I want you to know the Chairman here has a great interest in that subject matter and I am sure it will be considered in our deliberations.

Mr. MINETA. Thank you very much. Let me see, Mr. Murtha is gone. Mr. Clinger.

Mr. CLINGER. No questions, I just thank both gentlemen, we are delighted to have your testimony.

Mr. MINETA. Any other members of the panel who have any questions?

[No response.]

Mr. MINETA. If not, Mr. Ward, again thank you very much for your fine statement. It has been submitted for the full record, and we appreciate all the people who have been here to testify before us and we appreciate the accommodation of our Committee while here in Altoona. The hospitality by everyone has just been super and I can understand why Congressman Shuster is so proud to be representing the Ninth Congressional District.

So again to all of you, thank you so much for your hospitality. We appreciate it.

At this point, the Subcommittee adjourns its hearing.

[Whereupon, at 10:22 a.m., the Subcommittee was adjourned.]

PREPARED STATEMENTS OF WITNESSES

TESTIMONY PRESENTED TO THE SUBCOMMITTEE ON SURFACE TRANSPORTATION COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION

Altoona, PA
September 17, 1990

Presented by:

Robert Bini, Director
Centre Regional Planning Commission
Fraser Plaza, Suite #5
131 South Fraser Street
State College, PA 16801

814-231-3050
814-231-3088(Fax)

RE-AUTHORIZATION OF THE POST INTERSTATE SURFACE TRANSPORTATION PROGRAMS

The vitality of the on-going partnership for surface transportation is of critical concern to those of us at the local level. State government plays a vital role, however the Federal government is the very foundation of our comprehensive transportation planning and programming efforts. Continued Federal involvement through funding for balanced local transportation programs is, from our point of view, of the highest priority.

The Centre Region, is a dynamic, and growing community. Our geography places us at or near the intersection of several major traffic routes. Among these are Interstate 80, U.S. Routes 220 and 322, and PA Routes 144 and 26. These routes serve heavy volumes of interstate travel which include heavy truck traffic. This traffic is, for the most part, travelling on two lane highways through heavily populated areas, and on highways which must also serve commuter traffic originating from or destined for the Centre Region. These routes serve commuter traffic because the Centre Region is home to traffic generators which include major employers and special events. Primary among these is Penn State University, which is rapidly becoming one of the nation's leading major research universities. Evidence of this is the University's current initiative to develop a 130 acre research and business development park which will carry them into the 21st century and continue to make the University a prime factor in the continued dynamic nature of the community. As a result, growth in the Centre Region is anticipated to be substantial, with population expected to increase by nearly fifteen percent by the year 2000. In turn, employment is also expected to increase significantly.

The locational and growth factors which will continue to influence the Centre Region clearly indicate the need for a highway network which can safely and efficiently accommodate the movement of goods and people both through and within our communities. Upon closer look, it becomes obvious that there are a number of missing links on our major traffic routes which must be provided if we, and our neighbors here in Centre County and throughout the Appalachian Region of Central Pennsylvania, are to meet our system goals of improved connections to more modern facilities, improved safety, and the reduction of growth-related congestion. These missing links can be found on various connections to I-80 including Routes 220, 322, 144 and 26. The U.S. 220 link is also critical for providing a better connection to the Altoona area, I-76, and Western Pennsylvania.

Planning for our highway system is occurring at every level. The Federal Highway Administration is currently exploring the feasibility of a Highways of National Significance Program. The Pennsylvania Department of Transportation is in the preliminary stages of identifying a Core Highway System for the Commonwealth. Here at the local level, we are updating our long-range Regional Transportation Plan to provide a balanced

program of highway improvements and transportation demand management strategies. At each of these levels, highways such as U.S. Route 220, U.S. Route 322, and Pennsylvania Routes 144 and 26, play key roles. For travel patterns at every level, so-called missing links or system gaps have been identified through the planning process. Our ability to address these missing links will be dependent on the continued strength of the Federal/State/local transportation partnership. Likewise, Federal funding has been critical to the development of an effective mass transit system in the Centre Region. Continued, substantial support for transit will be essential to our strategies aimed at reducing congestion by offering viable options to the single occupancy vehicle.

The responsibility to plan for transportation needs is shared by all levels of government. The ability to implement those plans is dependent on financial participation at all levels. The re-authorization of surface transportation programs in the post-interstate era is a singular opportunity to have significant impact on funding for critical and integral highway improvements which:

1. Improve connections among elements of the interstate system;
2. Provide connections to the interstate system for areas such as the Centre Region which are not now clearly connected via a modern highway system;
3. Improve economic development opportunities that may be related to upgraded transportation facilities (such as Penn State University's economic development initiatives and tourism as a growing industry in the Centre Region); and
4. Assure that mass transit plays a strong role in reducing current and future congestion on our highways.

We believe that the substantial funds which were dedicated to the Interstate system in the current Surface Transportation Act should be re-programmed for use in now completing the highway system at the next level which will further support interstate travel, enhance our economic vitality, and respond to our changing population and travel patterns over time. In addition, the Highway Trust Fund must be used only for transportation programs for highways and mass transit. We would also urge that the State be given maximum latitude for prioritizing projects and apportioning funds according to a properly balanced Federal/State/local partnership. With Federal financial support for such a process we believe that we can complete such projects as the missing link on U.S. 220 through Centre County between Blair County and Interstate 80, as well as needed projects on the other routes we have mentioned. We, therefore, strongly support the re-authorization in 1991 of surface transportation programs in the areas of Federal-Aid highways, mass transit and highway safety in consideration of our comments here today.

Thank you.

RE: Reauthorization of the Post-Interstate Surface Transportation Programs.

Dear Chairman Anderson:

On behalf of the Centre County Planning Commission, we thank you for this opportunity to present our thoughts and recommendations related to the reauthorization of the Post-Interstate Surface Transportation Programs.

INTRODUCTION

Access to and from Centre County has historically been provided by U.S. Routes 322 and 220. This primary means of access has more recently been supplemented by Interstate 80, a major east-west corridor through Pennsylvania. With the completion of the Interstate System, Centre County has experienced a significant increase in both intra and interstate truck movements.

With the dynamics of Centre County's accelerated growth, particularly in the State College-Penn State University area, and with the ever increasing number of trucks passing through Centre County, we at this time call upon the Federal Government and the Commonwealth of Pennsylvania to provide adequate levels of funding which will allow for the completion of various highway links which have not yet been constructed through Centre County.

IDENTIFICATION OF THE PROBLEM

If we look at PennDOT's Primary Commercial Highway Network which includes the Interstate System, the Appalachian Thruway, as well as other Major Arterial Highways ... we see that the Network <u>is not yet complete</u>.

A close observation suggests that various "missing links" exist across Pennsylvania and ... we're here today to encourage you to recognize these gaps in our highway system and to do what you can to assure that adequate levels of Federal funding will be available in the future to allow the Pennsylvania Department of Transportation to proceed with the completion of the State Highway Network which will allow for the construction of the remaining "missing links."

The Centre County "missing links" are the feeder routes or connectors between our local communities and employment centers and the Interstate System of Highways and include the following:

1. The Route 144 "missing link" between I-80 and Route 322 at Potters Mills (estimated total cost $23.5M).

2. The Route 26 "missing link" between I-80 and Route 322 at the Mount Nittany Expressway near State College and the Pennsylvania State University (estimated total cost $75M).

3. The Route 220 "missing link" between the Village of Bald Eagle in Blair County and I-80 near the communities of Milesburg and Bellefonte (estimated total cost $217M).

* Please see Attachment A.

As many of you know, Centre County is located in a relatively isolated rural portion of Central Pennsylvania - far removed from the dynamics of the big cities such as Pittsburgh and Philadelphia (and for this we are most grateful). However, this geographic separation often leaves us in a position of disadvantage when it comes to receiving a "fair share" of the limited funds which exist today for various infrastructure needs. As such, we call upon you today to recognize our special needs and facilitate, to the extent possible, the allocation of adequate levels of federal funding that will allow the State to complete the Core System network of major arterial highways for Pennsylvania. This Core System of Highways includes the Highways of National Significance. Funding for this network will go a long way toward resolving our current and projected local transportation problems.

PLANNING FOR LOCAL COMMUNITY INFRASTRUCTURE

Detailed planning studies are currently being prepared in Centre County and the Centre Region to provide for community support systems including water, sewer, and solid waste disposal. However, detailed planning for the transportation system necessary to accommodate projected travel demand and community growth patterns has not kept pace with the planning for other infrastructure systems.

In addition to travel demand generated within Centre County, the numerous regional highways that bisect the County serve travelers with origins and destinations far beyond the County. The presence of this through traffic is caused in part by the "missing links" and results in an even greater demand

upon the local transportation system including increased levels of severe traffic accidents involving numerous fatalities (please see Attachment B).

The responsibility to plan for the increased travel demand must be shared in a partnership, which includes the affected local communities and the State and the Federal Governments, if we expect to meet PennDOT's established planning priorities related to: Goods Movement, Congestion, and Safety.

A LOCAL CONSENSUS OF NEED

Although Centre Countians have not always agreed on what would be the best solution to resolve our long-range traffic problems, we stand today, for the first time, united behind a strong consensus that major highway improvements are needed in the Route 144, 26, and 220 corridors.

At the State level, efforts are currently underway, or are being considered, to initiate the planning, engineering and design phases of the corridor studies; however, these efforts will not advance unless adequate levels of funding can be authorized.

Although the emphasis of our testimony today is directed toward our transportation problems related to highways, please be assured that we also recognize the need for an integrated comprehensive transportation system that includes mass transit and scheduled air service.

SUMMARY STATEMENT

In summary, I would like to emphasize that Centre County has not only become a cross roads for movements of goods and services - but it has also become the hub of a very rapidly growing urban metropolitan center.

With this growth and change, comes the need for costly transportation facilities; and, as we all know ... FUNDING becomes the key to implementation.

We thank you at this time for your further consideration of these matters. Should additional clarification of these projects be necessary, please feel free to contact me.

Respectfully submitted,

Robert B. Donaldson
Director

GASOLINE SPILL: Officials diked the roadway around the overturned gasoline tanker with sand and absorbent cloth material to keep the fuel from leaking into Bald Eagle Creek.

Fatal wreck closes Route 220

By JODI BURCK 5.16.90
Times Staff Writer

A Blair County man was killed when his car veered into the path of a gasoline tanker truck on Route 220 near Port Matilda Tuesday morning. Traffic between Port Matilda and Bald Eagle was expected to remain closed until early this morning after the tanker, loaded with 8,500 gallons of gasoline, overturned in the middle of the road.

Police have identified the victim as James Bender Jr., 44, of Bellwood.

State environmental officials, fearful that the fuel would contaminate the nearby Bald Eagle Creek, rushed to the scene about three miles south of Port Matilda.

Eagle Tire and Towing of Milesburg, which is approved by DER to clean up hazardous spills, was called in to help transfer the gasoline into another tanker and then remove the wreckage and waste, police

Please see FATAL page 5A

RTE. 220 DETOURS

If the road is still closed this morning, traffic on Route 220 from State College will be diverted onto Route 322 through Philipsburg. Traffic from Bald Eagle will be diverted onto Route 350 into Philipsburg.

Cars going between State College and Altoona can also use Route 550 through Warriors Mark, police said.

Attachment B

TESTIMONY PRESENTED TO THE SUBCOMMITTEE ON SURFACE TRANSPORTATION COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION

ALTOONA, PA
SEPTEMBER 17, 1990

PRESENTED BY:

ROBERT C. FINLEY, CHAIRMAN
TRANSPORTATION COMMITTEE
STATE COLLEGE AREA CHAMBER OF COMMERCE
FRASER PLAZA SUITE 3
131 SOUTH FRASER STREET
STATE COLLEGE, PA 16801

814-237-7644

Good morning. I am Robert C. Finley, Chairman of the State College Area Chamber of Commerce, Transportation Committee. My purpose in coming before you is to convey, in the very clearest terms, the support of the State College Area Chamber of Commerce for the testimony presented to you this morning by Mr. Robert Donaldson, Director of the Centre County Planning Office and Mr. Robert Bini, Director of the Centre Region Planning Office.

Access to the Centre County and the Centre Region has long been critized and joked about. The problem is real. As Mr. Donaldson and Mr. Bini have expressed, we see our highway needs as three missing links:

1) A good limited access Route 26 between State College and Interstate 80.
2) An improved Route 144 between Route 322 and Interstate 80 to accommodate a high volume of truck traffic, and
3) The completion of Route 220 as a four lane limited access highway between Bald Eagle in Blair County and Interstate 80.

The funding and construction of these mission links would provide, together with what is already in place, a very safe and serviceable highway system for Centre County and the Centre Region, a system capable of safely providing adequate connections to the Interstate System, accommodating through and local truck traffic and capable of supporting the dynamic growth of the Centre Region specifically the 15% increase in population expected by the year 2000. To provide these links, we see a

clear need to structure future Federal Surface Transportation programs so that dollars once used for interstate system construction are now made available for highways which connect the communities to the Interstate System.

We urge that Congress continue and strengthen the effective Federal/State/Local transportation partnership concept. As you can see here today, we in the Centre Region have confidence in our local planners and we commend them for their quality work and the consensus they have developed among our communities for our priority highway projects. PennDOT has been an equally cooperative partner in understanding our needs and priorities and in responding to the needs of our communities. We welcome the Federal Government in this partnership. It has worked in the past to give us what we have today and with some redirection in the new surface transportation programs should be capable of meeting our future needs.

I again want to state that the State College Area Chamber of Commerce fully supports the testimony given here today by Mr. Donaldson and Mr. Bini. The Chamber strongly support the re-authorization in 1991 of surface transportation programs with consideration of our comments here today.

Thank you very much.

9/14/90

Associated Pennsylvania CONSTRUCTORS

HENRY L. HECK, CAE
Executive Vice President

Testimony

of

Henry L. Heck, CAE
Executive Vice President

Associated Pennsylvania Constructors

Before

The Subcommittee on Surface Transportation

of the

House Committee on Public Works and Transportation
U.S. House of Representatives

Altoona, Pennsylvania

September 17, 1990

800 NORTH THIRD STREET • HARRISBURG, PENNSYLVANIA 17102-2099 • TELEPHONE (717) 238-2513 • FAX (717) 238-5060

Good morning, Mr. Chairman and members of the subcommittee. For the record, my name is Henry L. Heck and I am Executive Vice President of the Associated Pennsylvania Constructors, which is based in Harrisburg, Pennsylvania.

I am pleased to present testimony today on the transportation needs of this nation and the relationship of the Surface Transportation Act of 1991 to meeting those needs.

APC has been representing Pennsylvania road builders, material suppliers, equipment dealers, engineers and others involved in the transportation industry since 1927. We have approximately 600 member firms.

I am also here today on behalf of the American Road and Transportation Builders Association (ARTBA) - APC's national association. ARTBA has been providing Washington representation for the transportation construction industry since 1902. ARTBA's nearly 4,000 members nationwide hail from both the public and private sectors. ARTBA represents not only construction firms but also state and local transportation officials, manufacturers of equipment, consulting engineering and design firms, material and traffic safety device suppliers and educators in the fields of transportation planning and civil engineering.

Mr. Chairman, on behalf of our membership, thank you for inviting me to provide our views on future transportation needs, identification of problems in the current program, and proposals for new program structure and funding. At the outset, I will say that we believe that the financial decisions that the Congress makes next year in the transportation area will have a direct impact on the nation's economy and well-being long into the future.

America is built on mobility. Its vast size places a high value on the ability to move people and goods over both short and long distances in an economical and efficient manner. The American highway system, developed jointly by the federal and state governments, has had more to do with our quality of life and economic prosperity than any other single factor.

Today, America's federal highway system--the backbone of our national economy--is in serious trouble.

While this network of highways and bridges comprises only 22 percent of the nation's total road mileage, it carries 81 percent of all travel--more than 1.6 trillion miles per year.

According to the U.S. Department of Transportation's 1989 report to Congress, more than 28 percent of the bridges on the federal-aid system are either "structurally deficient" or "functionally obsolete." The same report states that more than 40 percent of the pavements on the federal-aid system are in "poor" or "fair" condition (See figures 1, 2 and 3).

Interstate Highway Bridges: Percent Classified as Deficient

Figure 3

This 1989 report and the Federal Highway Administration's 1988 publicati , America's Challenge For Highway Transportation in the 21st Century, both state that meeting existing capital needs on the federal-aid system alone requires a $40 billion per year investment in transportation construction projects--a rate of spending substantially in excess of the current obligations for the Federal-aid Highway Program.

Meeting these quantified needs on the federal-aid system is one of the major financial challenges facing the nation. Failure to provide an adequate and useable highway system will have a profound effect on the quality of American life, our economic growth and development, and our ability to meet national defense requirements.

The Federal-aid Highway Program has been a driving force behind building a better America. The reauthorization of this federal program should foster continued opportunities for growth and development.

If the program's reauthorization legislation does not address known needs in a meaningful way, the deterioration of the Federal-aid Highway System, which is becoming more apparent every day, will continue, placing the American economy in danger. Today, highway disrepair and congestion are contributing to increased economic costs, air pollution and wasted energy resources.

Americans continue to commute by private automobile. Such travel is up 17 percent since 1960 and contributes to significant rush hour congestion on 65 percent of Urban Interstate System mileage. The outlook for the future is not good. Traffic is projected to grow by two to four percent per year in the decade ahead.

According to federal statistics, the nation now wastes 1.25 billion hours and 1.38 billion gallons of motor fuels due to congestion on limited access highways each year. By the year 2005, that waste could soar to 6.9 billion hours in lost productivity and 7.32 billion gallons of squandered fuel.

Economists at the U.S. Department of Transportation estimate that if our highways are allowed to continue to deteriorate, by 1995 the U.S. economy could potentially miss out on increases of 3.2 percent in Gross National Product (GNP), 5.9 percent in disposable income, 2.2 percent in employment and 2.7 percent in manufacturing productivity.

Disinvestment caused much of our current problem (See figure 4). Total public capital expenditures for highways and bridges has dropped from 1.4 percent of GNP in the early 1960s to about 0.5 percent today. During this same period, traffic on the Federal-aid Highway System has increased five fold.

Inflation has also been a hidden factor. Between 1959 and 1988, the U.S. inflation rate, as measured by the Consumer Price Index, rose slightly over 300 percent. The highway user fees supporting the Highway Trust Fund and paying for highway improvements increased by only 100 percent (See figure 5).

The Disinvestment of the Nation's Transportation Infrastructure

Total Public Expenditures for Highways, Streets, Roads and Bridges

Figure 4

ARTBA

Inflation's Impact on the Federal Highway Program

Inflation Versus the 1959 Highway User Fee (Gasoline)

Figure 5

Assuming a moderate future inflation rate of four percent per year, the fede gasoline user fee would have to increase to 26 cents-per-gallon by the year 2000 just to maintain its 1959 purchasing power.

What should be done? The solution to our highway problem is obviously: we must begin investing in the future. Providing adequate resources is the key.

One alternative is to spend the current cash balance in the Highway Account o the Highway Trust Fund to address the call for greater highway improvement expenditures. But how far will that $10 billion balance 90?

An examination of the language of the Highway Revenue Act authorizing the Highway Trust Fund shows that deficit spending in this fund is prohibited. Since the entire balance cannot be spent, the portion that is available, between $5 and $8 billion, will not significantly increase the current program.

Apogee Research, a leading public works consulting firm based in Washington, has developed a computer model for ARTBA which allows a review of possible program funding scenarios and their effect on the trust fund balance and program spend out. We will share this information with the subcommittee and its staff as it is developed.

The Associated Pennsylvania Constructors believes the reauthorization bill drafted by this subcommittee should provide $40 billion per year for highway and bridge improvements. This authorization level should commence in 1992 and continue for a minimum of five fiscal years thereafter. Such a program level is totally consistent with the needs identified by the U.S. Department of Transportation referred to earlier in our testimony.

To authorize and carry-out a program of this magnitude, we recommend that the Congress:

* Ensure that all federal highway user fee revenue contributed to the Highway Trust Fund--plus interest earned on that money--is spent in a timely manner. A drawdown in the trust fund's current $10 billion-plus cash balance should begin during the next fiscal year.

* Remove the Federal-aid Highway Program from the Unified Federal Budget in order to ensure that revenues are not impounded or withheld in the future.

* Increase the federal highway user fees--effective in fiscal year 1992--to raise the additional $25 billion per year that is necessary for a $40 billion per year federal program of highway improvement assistance.

* No longer impose artificial obligation ceilings on the expenditure of federal highway funds.

* Repeal the current six cents-per-gallon federal tax exemption on gaso . sales for highway vehicle usage (which causes an estimated $500 million per year loss to the Highway Trust Fund); and

* Tighten federal highway motor fuels collection procedures.

These actions would assure that future generations have a highway system on which they can build. The historic role of the federal government in the development and upkeep of a national highway network should be maintained.

There is no question that the federal government has a clear role to play in the development and upkeep of a national system of highways and bridges. The federal responsibility is defined by the Constitutional mandates to regulate commerce among the states and with other nations, provide for the national defense, and safeguard the public health.

The user fee principle that has guided the financing of our national highway transportation program has contributed to its success. Highway users recognize the importance of well-maintained highways and bridges. They also realize that continued expenditures must be made in order to maintain system performance at an acceptable level. Over the years, motorists have shown a willingness to pay appropriate user fees--if they are used for their intended purpose (See figures 6 and 7).

Recent surveys of the American public and U.S. business leaders indicate that this view is still held. In work done by Apogee Research for the Transportation Research Board, the public said overwhelmingly that they would pay higher gasoline user fees for improved highways. In a poll taken at the 1989 U.S. Chamber of Commerce annual meeting, business leaders from across the nation expressed overwhelming support for more federal expenditures for highways, recognizing that higher motor fuel taxes are necessary.

Consistent with our recommendation for increased funding, APC and ARTBA also believe that the working partnership between the federal government and the states, which is the basis of the existing federal-aid program, must be continued.

Some have suggested that state and local governments should be responsible for raising revenue to meet future needs for rebuilding and expanding our highway system. In fact, over the last 20 years, federal support for improvements has declined over 20 percent in constant dollars.

While the federal interest has continued, state governments have worked to increase state revenues for highways to keep the system from further deterioration.

Now is the time to re-establish the true meaning of the federal-aid highway partnership and to live up to the federal commitment to adequately fund improvements on highways and bridges significant in meeting transportation responsibilities.

National Highway Revenue Receipts: 1987

The Federal Share of National Highway Revenue Receipts Has Been Decreasing Since 1985 and in 1987 Reached the Lowest Mark in 27 Years (22 Percent).

ARBA

Figure 6

The Federal Highway User Fee Represents Less Than 1% of the Total Annual Transportation Spending by the Average American Consumer

- Hwy User Fee 0.90%
- Gasoline & Motor Oil 18.62%
- Other Expenses 36.01%
- Vehicle Purchases 44.46%

ARBA

Figure 7

The unwillingness of the federal government to raise and spend sufficient fu to maintain system performance has resulted in a program that is not fully meeting identified needs. Now is the time for bipartisan leadership in this area if we are to meet our future transportation demand.

While public, user fee supported financing should remain the keystone of our national highway improvement program, no financing option should be ignored. ARTBA sponsored a conference in 1989 on "Public/Private Ventures in Transportation" to review this opportunity for other funding mechanisms to meet transportation needs.

Public/private ventures have long been successful in other countries and are gaining support in this country. They must be explored and implemented where appropriate.

Proper investment is the key to meeting future highway needs. With our views on record as to investment and the method of meeting this investment requirement, let me turn to APC's views regarding program structure and allocation of resources.

A FEDERAL HIGHWAY PROGRAM FOR THE FUTURE

With a $40 billion per year federal investment, America CAN meet its highway and bridge capital requirements for the next century. Here's how that money could be put to work to restore--and expand--our national highway system.

COMPLETING THE INTERSTATE HIGHWAY SYSTEM

The 42,797-mile Interstate Highway System accounts for only 5.2 percent of the federal network mileage, yet carries 27 percent of the traffic. It's clearly the backbone of our national surface transportation system.

Construction on this system began in 1956. Today, 98 percent of the system is open to traffic. According to the Federal Highway Administration, an additional $5 billion is needed for completion. Let's finish the job!

APC Recommendations:

* Fund completion of the full Interstate Highway System with a one-time final authorization of $5 billion. Since actual use of these funds would be spread over several years, an allowance for inflation should also be provided.

* To be eligible for these funds, however, Congress should require that construction on all remaining projects begin no later than September 30, 1996. Additionally, adequate funds should be made available under the "Advance Construction/Interstate Program" to fully repay all states that have used this option.

PROTECTING THE INTERSTATE HIGHWAY INVESTMENT

Highway users have invested more than $100 billion in the Interstate Highway System, making it perhaps the nation's greatest physical asset. Today, however, more than 40 percent of the pavement mileage on the Interstate System is below minimum engineering standards. Let's protect our investment!

The Federal Highway Administration says that an annual investment of up to $6. billion is necessary just to maintain 1985 conditions on the Interstate System.

APC Recommendations:

* Initiate a major interstate rebuilding program by authorizing a $6.6 billion per year interstate 4-R program of resurfacing, restoration, rehabilitation and reconstruction. Assure that the latest in pavement design technology is utilized in this effort to maximize the return on investment.

* Authorize an additional $600 million per year for Interstate 4-R discretionary programs, with $200 million per year allocated to fund unusually high-cost bridge projects on the system.

* Set the federal/state funding ratio for Interstate "4-R" at 90/10, including projects to add new lanes or construct essential new interchanges.

* Ensure that any future additions to the Interstate System are automatically eligible for 4-R funding and maintain existing provisions in law which allow the transfer of new construction funds for 4-R work.

* Give states the flexibility to transfer up to 50 percent of their share of "4-R" funding to projects in other program categories of national importance, provided that the state can satisfy the U.S. Department of Transportation that its Interstate mileage is being adequately maintained.

REBUILDING OUR BRIDGES

More than 238,000--or about 40 percent--of the nation's bridges are either "structurally deficient" or "functionally obsolete," according to the U.S. Department of Transportation. As noted previously, 28 percent of these bridges are on the federal system.

The inherent safety problems and economic displacments posed by deficient bridges demands that repairing them become a national priority of the highest order.

The Federal Highway Administration says that $50.7 billion is needed to rehabilitate or replace all deficient bridges on the federal system.

APC Recommendations:

* Require each state to develop a plan that systematically addresses their bridge problems and assigns highest priority to repairing or replacing structurally deficient structures.

* Authorize $5 billion per year to repair the nation's bridges. While this funding should be directed primarily toward bridges on the federal-aid system allow offsystem bridges to remain eligible for federal funding with certain restrictions as permitted under current law.

* Allocate bridge rehabilitation funds on a "cost-to-complete" basis (continue the current one-quarter percent minimum, 10 percent maximum formula).

* Set the federal/state funding ratio at 90/10. Do not allow a state to transfer bridge funding to other program categories unless it can demonstrate to the U.S. Department of Transportation that it is pursuing a program that specifically addresses structurally deficient bridges as a priority.

CREATING A REGIONAL PRIMARY SYSTEM

This 258,120-mile system is the nation's second most important network of highways. It serves as a collector system for the Interstate and services traffic in corridors not on interstate routes. The Primary System currently handles 29 percent of the nation's traffic mileage.

The Federal Highway Administration says that an annual investment of up to $6.7 billion is necessary just to maintain 1985 condition on the Primary System.

APC Recommendations:

* Make the Primary System a truly regional road network by changing the definition of the type of mileage that is eligible for inclusion. The reduced system would include only routes of national significance that meet interstate and inter-regional traffic needs.

* Provide $6 billion per year to rehabilitate the Primary System and upgrade as many of these routes as possible to near-Interstate standard. Set the federal/state funding ratio at 90/10 and give states with well-maintained Primary routes the flexibility to transfer up to 50 percent of their Primary funding to other program categories.

RELIEVING TRAFFIC CONGESTION

Anyone who lives in a urban/suburban area knows traffic congestion firsthand. Without improved traffic management and added capacity the situation will only get worse. A new national program is needed to address this problem.

The Federal Highway Administration says that an annual investment of up to $ billion is necessary just to maintain 1985 conditions on the Urban System.

APC Recommendations:

* Create a "Metropolitan Area Transportation Assistance Program," funded at $4.5 billion per year, to help alleviate traffic congestion in urban/suburban areas with 50,000+ population. The program envisioned would direct federal funds to projects that are part of strategic regional plans that attack congestion. Projects funded under this program would include road and bridge capacity improvements, roadway rehabilitation projects that improve traffic flow, creation of "High Occupancy Vehicle" (HOV) and exclusive bus lanes, implementation of freeway surveillance, incident systems and "smart highway" computer technology.

* Set the federal/state funding ratio at 70/30 and require that eligible routes be on the federal system. Give states flexibility in designing routes to be included in urban areas.

STIMULATING ECONOMIC GROWTH WITH NEW TRANSPORTATION CORRIDORS

The demographics of the United States have changed dramatically since the plans for the Interstate Highway System were drawn over 40 years ago. Many distant "suburbs" now provide more jobs than the major cities linked by the current Interstate System. It's time the federal highway program recognized--and assisted--these emerging economic centers.

APC Recommendations:

* Create a "New Transportation Corridors Program," funded at $3.5 billion per year, to assist high-growth areas not currently served by the Interstate System. The program would be aimed at building new highways--and upgrading existing ones to near-Interstate standard--to provide capacity for the increased traffic volume that is associated with emerging economic centers. Eligibility for participation in the program would be based on criteria such as population growth rate, measurable economic activity and potential for further economic growth.

* Set the federal/state funding ratio for the "New Transportation Corridors Program" at 70/30.

MOBILIZING RURAL AMERICA

With a redefined--and smaller--federal Primary System, an expanded Secondary Highway System would assume even greater importance. This system, which now includes 398,328 miles of highway in rural America, provides the vital farm-to-market and small community-to-market transportation link that is so important to the nation's economy and well-being. Pennsylvania has the larger rural population in the country.

The Federal Highway Administration says that an annual investment of up to $1.7 billion is necessary just to maintain 1985 conditions on the Secondary System.

APC Recommendations:

* Provide $5 billion per year for an expanded rural highway support program.

* Set the federal/state match for this program at 70/30.

IMPROVING HIGHWAY SAFETY

While there have been significant advances in highway design, safety equipment and signage over the past several decades, the carnage on our nation's highways continues. In 1989, more than 45,000 Americans were involved in highway fatalities and another three million were injured in traffic accidents. Clearly a more aggressive effort to improve highway safety is warranted.

APC Recommendations:

* Increase federal highway safety funding to $2 billion per year, continuing all categorical safety programs that are in current law.

* Initiate a federal study of highway signage and traffic safety devices to determine the need to rehabilitate or upgrade such devices on the federal system to incorporate new technologies.

* Provide funds to improve worker and motorist safety in highway construction areas.

* Require that products and services that enhance safety and improve traffic operations be included criteria for all federal "3-R" and "4-R" programs.

INVESTING IN RESEARCH

Every effort must be made to ensure that we receive maximum benefit from every dollar invested in highway capital improvements. Greatly increased emphasis must be placed on public and private highway research and development programs.

APC Recommendations:

* Authorize $2 billion per year to support expanded federal highway research programs.

* Encourage--through special tax incentives and other means--private sector research and development projects that have the potential to improve the quality, durability, safety and operation of our highways and bridges.

OTHER ISSUES

In our view, as part of its highway program reauthorization legislation, Congress should also take action to:

* Make the federal Highway Trust Fund permanent.

* Ensure that each state receives back at least 90 percent of the revenue that it contributes to the Highway Trust Fund. This is a particularly important issue to "donor" states such as Florida that currently receive back 80 - 85 cents for each dollar sent to Washington.

* Levy user fees on all motor fuels--including gasohol--in an amount at least equal to that levied on gasoline to ensure that adequate highway improvement funds are available.

* Expand the Federal Lands Program to $1.5 billion per year.

* Provide greater flexibility in the co-mingling of federal assistance and toll revenues to finance capital improvements on toll facilities.

* Provide $500 million per year for emergency relief.

* Revise the federal Disadvantaged Business Enterprise program to ensure that it is aiding firms that are truly in need of assistance.

IT'S AN INVESTMENT IN THE FUTURE

America is literally at a crossroad. We can continue to ignore our serious and growing highway and bridge problems. Or we can choose to make the investment--about $40 billion per year--that is necessary to rebuild and expand our national highway network to meet future demands.

Good roads save lives. Improve productivity. Enhance competitiveness. And reduce pollution-causing, energy-wasting traffic congestion. In short, they're an investment in the future.

Together, let's build a better America through transportation. The time to act is NOW!

FEDERAL HIGHWAY PROGRAM FUNDING RECOMMENDATIONS

(Per Fiscal Year)

Interstate Construction*	$1.0 Billion
Interstate 4-R	$6.6 Billion
Interstate 4-R Discretionary	$0.4 Billion
Bridge Rehabilitation & Replacement	$5.0 Billion
Primary System	$6.0 Billion
Metropolitan Area Assistance Program	$4.5 Billion
New Transportation Corridors	$3.5 Billion
Secondary/Rural System	$5.0 Billion
Highway Safety	$2.0 Billion
Federal Highway Research Programs	$2.0 Billion
Minimum Allocation Program	$2.0 Billion
Federal Lands Program	$1.5 Billion
Emergency Relief	$0.5 Billion
TOTAL	$40 Billion

* The authorization for the Interstate Construction program is currently $3.15 billion and $1.4 billion, respectively, for Fiscal Years 1992 and 1993 by the *Surface Transportation and Uniform Relocation Assistance Act of 1987.* ARTBA recommends an additional appropriation of $1.75 billion in FY 1993 and $3.25 in FY 1994 to complete the Interstate Highway Program.

Source: Apogee Research
Bethesda, Maryland

Mr. Chairman, before I close, a comment about the fiscal year 1991 bu proposal for the Federal-aid Highway program is in order. The budget recently sent to Congress by President Bush calls for an obligation limitation of $12.0 billion for highways. This is a seven percent reduction from the fiscal year 1990 level after sequestration and the budget compromise.

This appears to be a step backward when the talk is for a forward-looki program. The "National Transportation Policy" enunciated by Secretary Skinne certainly does not talk about a reduction in the federal commitment. It talks about at least maintaining our current commitment.

The FY 91 budget must then be reviewed in the context of a need to increase the obligation limitation to at least last year's level, but preferably to a level reasonable under the 1987 Surface Transportation and Uniform Relocation Assistance Act--$15.0 billion. This level can be achieved by using all revenue accruing to the trust fund annually, interest earned on the trust fund balance, and prior year authorizations constrained by annual obligation limitations.

Thank you, Mr. Chairman, for the opportunity to present the views of the Associated Pennsylvania Constructors on future federal highway assistance. I stand ready to answ any questions that you or subcommittee members may have.

Presented to:

THE SUBCOMMITTEE ON SURFACE TRANSPORTATION

of the U. S. Congress

For:

Reauthorization of the Post-Interstate

Surface Transportation Programs

September 17, 1990
Altoona, Pennsylvania

By:

Robert E. Hetherington

Managing Director

PENNSYLVANIA HIGHWAY INFORMATION ASSOCIATION

Harrisburg, Pennsylvania

My name is Robert Hetherington. I am managing director of the Pennsylvania Highway Information Association representing businesses and individuals interested in an improved highway system.

Our organization is more commonly known as PHIA and, since 1960, has been working closely with PennDOT and local groups.

Let me read our mission statement:

"The Pennsylvania Highway Information Association gathers and disseminates information to educate the public on the importance and value of a modern, safe highway system adequately financed through dedicated funding sources, to provide for economic growth of the Commonwealth and its citizens."

The key point in this mission statement centers around the role the highway system plays in developing the state's economy. Equally important is the safety factor created by improved roads and bridges.

Since the Interstate Highway System began in 1956, improved roads have demonstrated the meaning of the mission statement of PHIA.

We have seen our roads and bridges stimulate the economy of an area.

We have noted an increase in safety and a decrease in accidents and fatalities where roads and bridges have been improved.

- MORE -

I particularly want to report to the committee today on some of the positive results from a study made in this area reflecting the improved economic and safety conditions in this area when the new Route 220 was built between the Pennsylvania Turnpike and Altoona.

At this point, I would be remiss if I failed to remember this new Route 220, that today benefits so many, came about because of the special efforts put forth by this region's Congressman Bud Shuster. It is fitting that a section of this road is now named in his honor.

Here is what a new Route 220 has done for the area:

- More than 2,500 new jobs have been created.
- Retail sales have increased by 37 percent in the past five years.
- Fifty-two businesses have invested $49.2 million, expanding plants or establishing new locations along the route.
- The fatality rate on the new route has been cut in half, in comparison with that on the old Route 220.
- Since 1983, nearly 2,200 jobs have been added to Altoona's economy.
- In Bedford County, another 1,000 jobs were created because of the new Route 220.

Economic stimulation to the region occurred when this new road was built. Further benefits will result when Route 220 is continued north of State College to connect with Interstate 80.

I am concerned this region's full economic potential will not be achieved unless additional federal-aid is provided to build this connection and others that are badly needed in Pennsylvania.

Earlier this year, U. S. DOT Secretary Skinner said the states will have to raise additional highway funds and not rely so heavily on federal aid. He made this statement at the same time a Highway user-supported Trust Fund, established by the Congress, had an unused balance of more than $10 billion. More than $520 million of highway user contributed monies from Pennsylvania have been accumulated since 1965.

Incidentally, the General Accounting Office has advised U. S. Senator Byrd, of West Virginia, that the Highway Trust Fund can remain solvent and meet all of its construction obligations even if the balance was as low as $3 billion.

While the committee struggles with taxpayer funding, we in Pennsylvania and other states where toll roads exist have enjoyed somewhat of a bonus.

It was 50 years ago next month when the first driver entered the Pennsylvania Turnpike near Carlisle. And today, more than 270,000 drivers travel the road each day.

The building of the Turnpike, which has since expanded to 470 miles in Pennsylvania, has taken a great deal of financial pressure off Pennsylvania and the Highway Trust Fund for many years.

At this point, I commend the Committee for the farsightedness written into legislation that now permits direct toll road connections, as well as limited federal funding.

We all know that the great Interstate Highway System, that now extends nearly 42,000 miles across our 50 states, was patterned after the Pennsylvania Turnpike. We in Pennsylvania are very proud of this historical point. We also know that toll roads have made a major contribution to the overall transportation picture in the nation, because more than 2,800 miles were incorporated into the Interstate Highway Act to give the program a jump start back in 1956.

Why not consider an economic bonus to the states that had the farsightedness to build toll roads when states did not have their own funds to build toll-free roads? These states picked up a tremendous slack in the nation's transportation system before passage of the 1956 Interstate Highway Act.

Another consideration that should be looked at is the extension of the current Interstate Highway System, authorizing new connections where demographic needs dictate.

- MORE -

The Pennsylania Highway Information Association refers to these types of roads as economic generator highways to tie into the existing Interstate System. If Route 220 between the Turnpike and Altoona had not been improved, thanks to Congressman Shuster, this would have been a good example. Similar situations exist across this land.

In closing, Mr. Chairman, PHIA is most supportive of the past direction by this important committee of the U. S. House of Representatives.

We are sensitive to the demands put upon you, but, at the same time, encourage your continued support of the following:

- Protect the integrity of the Highway Trust Fund from non-highway users
- Pass legislation to take the Trust Fund off the unified budget
- Increase the Trust Fund level to help states meet the growing and costly highway and bridge needs of the states.
- Reduce the $10 billion Highway Trust Fund surplus to a minimum operating level of $3 billion, as recommended by the General Accounting Office.

Thank you for the opportunity to present our views, Mr. Chairman. I will be more than happy to answer any questions to be of assistance to the committee.

Good morning, Mr. Chairman:

As an extension of my recent testimony before your committee's subcomittee at Altoona, may I introduce into the record the enclosed economic study we commissioned when the final section of Route 220 was complete between Bedford and Altoona. The beneficial information contained is very supportive on jobs generation and business expansion along the route.

The task of putting together a new transportation program for 1991 is one of gargantuan proportions, but I am sure you and your colleagues will have sufficient supporting documentation following your series of public hearings.

Please feel free to contact me if and when our organization can be of some assistance.

Sincerely,

Robert E. Hetherington

IMPROVED HIGHWAYS BOOST LOCAL ECONOMIES IN PENNSYLVANIA:

A Case Study of the New Route 220

NOVEMBER 1989

Prepared by

THE ROAD INFORMATION PROGRAM (TRIP)

1200 18th Street, N.W., Suite 314

Washington, D.C. 20036

(202) 466-6706

for

Pennsylvania Highway Information Association

800 N. 3rd Street, Suite 501

Harrisburg, Pennsylvania 17102

(717) 236-6021

Founded in 1971, The Road Information Program (TRIP) of Washington, D.C., is a non-profit organization which researches, evaluates and distributes economic and technical data on highway transportation issues. TRIP is sponsored by energy and insurance companies; equipment manufacturers, distributors and suppliers; businesses involved in highway engineering, construction and financing; labor unions; and organizations concerned with an efficient and safe highway transportation network.

Summary of Findings

-- In the past five years, $137.8 million has been invested in improving and modernizing U.S. Route 220 through Blair County in Central Pennsylvania, generating solid economic growth in the region through increased industrial expansion and the generation of new employment.

-- Between 1968 and 1974, some $45.1 million was spent improving Route 220 through Bedford County, south of Blair County, also impacting economic growth.

-- A total of 52 companies have invested $49.2 million in expanding existing plants or establishing new operations in Blair County since 1985, creating more than 2,500 jobs for local residents. In Bedford County, some 1,000 new jobs were created by new industrial activity between 1983 and 1985.

-- Retail sales in the Altoona metropolitan area alone jumped by some $240 million annually (37 percent) in the past five years, from $649.2 million in 1983 to $888.9 million in 1988. New highway construction and other road improvements have generated an estimated 2,197 jobs in Altoona's economy since 1983.

-- Traffic safety has improved with the construction of a new Route 220. On the older Route 220, an average of 6.2 traffic fatalities occur each year; on new Route 220, 4 fatalities occur annually, and that rate is expected to drop to 2 fatalities annually once Route 220 is completed to Tyrone. Also, in the past five years, 946 traffic injuries were reported on the old Route 220, while 256 injuries were reported on new sections of the highway.

-- The dramatic impact of improvements to Route 220 serves as a model for other areas of Pennsylvania, where wider, more modern highways are needed. Federal data show only 12.8 percent of the state's federal-aid highways are 4-lane divided (by a median strip), and these 3,378 miles include Pennsylvania's 1,523 miles of Interstate highways.

-- By comparison, 16.8 percent (4,191 miles) of New York's federal-aid system and 13.3 percent (3,663 miles) of Ohio's federal-aid system are four or more lanes and divided.

-- The vast majority of Pennsylvania's heavily traveled federal-aid highways -- some 20,826 miles, or 78.7 percent -- have only two lanes.

-- The state Department of Transportation plans to relocate or add lanes to some 528 miles (1.3 percent of the state-maintained system) over the next 12 years at a cost of $4.3 billion.

-- TRIP recommends that Pennsylvania implement the Route 220 concept statewide by constructing an "economic generator highway system" that would include the widening and improvement of many of the state's two-lane primary highways.

Introduction

In August, a dedication ceremony was held near Altoona to officially open a strategic portion of the Appalachian Thruway running through South Central Pennsylvania and to name it, "The Bud Shuster Highway." This ceremony honored the efforts of Congressman Shuster, who had been successful in securing some $149 million in federal highway funds to improve and expand U.S. Route 220 from the Bedford-Blair County border north to Tyrone.

This section of Route 220 will complete the vital North-South corridor from the Pennsylvania Turnpike north to Tyrone through South Central Pennsylvania. This corridor will improve transportation throughout the area, including the important movement of commercial goods and raw materials from point to point.

The local economy has prospered with the improved mobility, and as the final portions of the highway are completed in the near future, Altoona and the smaller towns and cities along the 220 corridor face a promising future.

This study examines the economic impact of the U.S. Route 220 improvements on Blair and Bedford Counties in South Central Pennsylvania, and assesses similar opportunities for road improvements and expansions in other areas of the state.

Sources of information include the Pennsylvania Department of Transportation, the Southern Alleghenies Planning and Development Commission, the Altoona Chamber of Commerce, Altoona Enterprises, Inc. (an industrial development corporation promoting business expansion in Blair County), the Federal Highway Administration and other government and private organizations.

The Appalachian Thruway

U.S. Route 220 comprises an important link in the 238-mile Appalachian Thruway, which stretches from Cumberland, Maryland, north through Central Pennsylvania along Route 220, connecting with Interstate 80 to Williamsport, then continuing up Route 15 to the city of Corning in lower New York State. Border to border, the Thruway passes through six counties in Pennsylvania, plus one in Maryland and one in New York. Currently, about two-thirds (66 percent) of the Thruway is either completed, in active design or under construction. More than half (56 percent) is now open to traffic.

The Appalachian Thruway Association was organized 25 years ago by members of the Highway Development Committee of the Altoona Chamber of Commerce who were interested in having a four-lane highway in the region, understanding even then the economic importance of adequate roads. Altoona was the last primary city in the United States to be connected to the Interstate System by a modern thruway.

The region was once a thriving rail crossroads. During the 19th century, Altoona was nicknamed, "Gateway to the West," and the city was home to a number of major railroad shops. When the Pennsylvania Railroad completed "Horseshoe Curve" through the nearby mountains, the rails were opened to east-west traffic.

But with the demise of rail, the region fell into a long-term recession. Altoona and other towns were accessible only by the then rural two-lane 220, and businesses were reluctant to settle in such an isolated area.

The slow growth of past decades has tracked into the 20th century in Blair County (where Altoona is located). Between 1970 and 1980, for instance, the county's labor force increased by just 12.6 percent while the national labor force increased 21.3 percent. Unemployment in Blair County climbed from 3.5 percent in 1970 to 9.1 percent in 1980; unemployment nationally increased from 4.4 percent in 1970 to 7.1 percent in 1980.

Although the unemployment rate in Blair County has remained higher than the national average into the 1980s, the total number of employed workers has outpaced the number of unemployed workers since 1983:

Year	Total Employed	Total Unemployed
1981	51,600	6,900
1982	49,600	7,500
1983	48,600	9,200
1984	50,600	6,300
1985	51,900	5,700

U.S. Route 220: The Bud Shuster Highway

On August 14, 1989, the Secretary of the Pennsylvania Department of Transportation, Howard Yerusalim, dedicated U.S. Route 220, naming it "The Bud Shuster Highway" in honor of Congressman Shuster's successful efforts to secure federal financing for the highway's expansion.

Governor Casey has described the new Route 220 as "the cornerstone of economic development in these counties for years to come."

Robert C. Jubelirer, President Pro Tem of the state senate, said,

> Modern highways, more than any other factor, have fueled the economic turnaround of our area. From trucking to tourism, commerce and jobs have been preserved and prospects improved because of the construction completed on Route 220, Route 22 and related projects.

Senator Jubelirer explained that good roads are essential in marketing a region because they "demonstrate to outsiders that a community or a county is oriented toward growth and progress, rather than facing decline."

Richard A. Geist, state legislator from Altoona, said, "The economic value of the new Route 220 has demonstrated itself already, but what is equally important is the intermodal potential for moving goods and people on our highways and rails."

Geist emphasized that the region should benefit from the new trade agreement with Canada and that "our transportation facilities will ensure this fact."

State Representative Richard Hess said of Route 220's significance, "The most important thing about this highway is that it's going to bring economic development."

Robert Couch, executive director of the Altoona Chamber of Commerce, welcomed the new highway to the area. "We've seen a major increase in business expansions as well as industries interested in relocating to the area," he said. "Our 1988 commercial building permits were up 500 percent over 1987 and our residential building permits for 1989 are up at least 100 percent over 1987." Couch added, "All in all, the widening of Route 220 has brought a tremendous impact to our community."

This commemoration and opening of the Altoona section of Route 220 represented the culmination of nearly two decades of federal, state and county cooperation. The highway project was begun in 1965 with passage of the Appalachia Regional Development Act which identified 13 states, including Pennsylvania, with specific and urgent economic needs, such as the basic need for mobility and better access to more developed areas. The construction of a new and improved U.S. Route 220 was included in the legislation.

By the late 1970s, improvements to the highway (made with Appalachia Regional Development highway funds) had been completed from the Pennsylvania Turnpike through Bedford County up to the Blair County line.

At this point the entire project was shelved because Pennsylvania was embroiled in a highway financial crisis. The state found that it was unable to meet its 30 percent share of the funding (federal funding made up 70 percent), so Route 220 improvements were not secured for several years.

The fate of a greatly improved Appalachian Thruway through Central Pennsylvania was decided ultimately in the U.S. Congress, through the efforts of U.S. Representative Bud Shuster. Congressman Shuster, who continues to serve as the ranking member on the House Surface Transportation Subcommittee, authored a provision in the Surface Transportation Act of 1982 granting $77 million in federal funds for the construction of a 7.9-mile four-lane limited-access highway from south of Altoona to the Blair-Bedford County line. The funding was 100 percent federal without any requirement for matching funds from the state.

Included in the legislation is a ten-mile stretch of Route 220 between the Bedford-Blair County line and Newry that is providing the site for a federal "demonstration project."

Demonstration projects serve as testing ground for state-of-the-art technology in highway engineering and construction, including such things as prestressed concrete pavement, lightweight concrete bridge decks, precast box culverts and proprietary abutments and walls.

The second boost in federal funding came in the 1987 federal highway bill (The Surface Transportation and Relocation Assistance Act of 1987). Congressman Shuster's efforts resulted in the securing of another $90 million for a demonstration project from 17th Street in Altoona north 12 miles to the Tyrone Bypass.

This construction, which required an $18 million state match advanced the dream of linking the turnpike to I-80 at Milesburg and began to address the seriously congested corridor between Altoona and State College.

Construction of the 12-mile segment of Route 220 from Altoona north to the borough of Tyrone is scheduled to begin in the Spring of 1990 and be completed in 1992. The last 28 miles connecting this segment with I-80 at Milesburg -- the last link in the corridor between I-80 and the Pennsylvania Turnpike -- has not yet been programmed.

Growth Along Route 220

"The growth and development of the Southern Alleghenies Region has ... always been dependent to a large measure upon the adequacy of its transportation system," reports the Southern Alleghenies Planning and Development Commission (SAPDC).

As U.S. Route 220 was expanded and improved from the Maryland/Pennsylvania border northward in the late 1970s, Bedford County experienced new growth. Prior to 1970, the county's population had remained fairly stable for several decades.

Between 1970 and 1980, the population increased by 10.5 percent, from 42,400 to 46,800. The only similar increase had occurred 40 years earlier, between 1930 and 1940.

Bedford County population is expected to continue to grow steadily through the end of the century, reports SAPDC. Population levels will climb nearly 10 percent between 1980 and 2000, reaching an estimated 51,400 residents.

But Bedford County's overall population generally is growing more slowly than population clustered along the Route 220 corridor through the county. Between 1980 and 2000, the number of Bedford County residents living in the Route 220 "corridor" is expected to nearly triple (+ 28.4 percent).

In Blair County, population decreased rather steadily between 1960 and 1980. Countywide, the number of residents decreased by 0.5 percent. In the Route 220 corridor, still unimproved during this time, population decreased by 2.8 percent.

Projections for population change in both the county as a whole (+ 2.8 percent) and the corridor (- 0.8 percent) through 2000 indicate continued sluggish growth and some population redistribution, based on data in the SAPDC report.

However, these projections are based on prior growth patterns and do not take into consideration the impact of Route 220 enhancements -- including increasing economic activity -- so it is likely the estimates are extremely conservative.

The Economic Impact of Route 220

"Industrial development has also followed existing U.S. Route 220," reports SAPDC. "Many of the industries locating within the region since World War II have chosen sites adjacent to or in close proximity with U.S. Route 220."

As in the past, industry and business in South Central Pennsylvania continue to seek locations that are very accessible and provide the greatest mobility for both workers and products -- usually on or near modern highways.

The construction of the new U.S. Route 220 through Bedford and Blair Counties in Central Pennsylvania has stimulated a great deal of economic activity in both the adjacent communities and outlying communities in the past seven years.

Altoona Enterprises Inc., a private, nonprofit industrial development corporation based in Altoona, reports that retail sales in the metropolitan area alone have jumped by some $240 million (37 percent) in the past five years, from $649 million in 1983 to $889 million in 1988.

Employment increased dramatically, not only in the road construction industry and its suppliers but also in other nonhighway-related industries across the local economy.

For instance, Altoona Enterprises Inc. reports that $150 million was spent for major road improvements, including Route 220, between 1983 and 1987. TRIP estimates that this investment directly generated 824 jobs in the Altoona area, less than half of them (382) in the construction industry.

TRIP's job estimates are based on research conducted by the Regional Science Research Institute (RSRI) in Peace Dale, Rhode Island, utilizing a U.S. Commerce Department Input-Output Model to measure the employment impact of highway investments. Results are unique to Pennsylvania and are based on historical spending trends in the state.

The research found that each $100 million invested in highways in Pennsylvania creates 2,746 jobs annually in all sectors of the state economy and generated some $36.6 million in immediate tax and dollar benefits for the state and its drivers.

Altoona Enterprises, Inc. reported that the state Department of Transportation plans to invest $201 million between 1987 and 1991 on Route 220 and other major road improvements in Blair County. TRIP estimates this four-year investment will generate some 1,373 jobs annually, creating a $35 million payroll and bringing in some $1.3 million in state income and sales taxes each year.

Pennsylvania's Employment Security Office reports that total employment in non-agricultural industries in the Altoona area rose more than 12 percent in the past six years, from 45,900 jobs in 1983 to 51,500 jobs in 1989. Manufacturing jobs increased in number only slightly (from 10,600 to 10,800), but non-manufacturing jobs jumped by 5,400 jobs, or 15.3 percent (from 35,300 to 40,700).

Overall industrial expansion in the Altoona metropolitan area is up dramatically over the past few years. Some 52 companies have invested a total of $49.2 million in expanding existing plants or establishing new operations in the area since 1985. These investments have created more than 2,500 jobs for local residents.

Bedford County employment trends have not increased as rapidly as those in Blair County. SAPDC reports that employment has not kept pace with the county's labor force. For instance, between 1970 and 1985, the labor force (people available to work) increased 23.4 percent, from 16,700 to 20,600 persons. Actual employment, however, climbed by only 15.6 percent in the same time, from 15,400 to 17,800 persons.

Despite the relative slow growth in employment since 1970, those trends seem to be changing. Between 1983 and 1985, SAPDC reports that approximately 1,000 new jobs were added to the county's economy. This recent jump in employment indicates a growing population work force, reflecting the additional economic activity spurred by improvements to Route 220.
